PRINTED BY BRADBURY AND EVANS, WHITEFRIARS, LONDON.

NUMBER 365.

SATURDAY, JANUARY 26, 1839.

PRICE THREE HALFPENCE.

WHAT ENGLISH LITERATURE GIVES US.
ENGLISH literature gives all who can enjoy it a fund of pleasure, of the great amount of which we are not apt to be quite aware till we run over a few of the items. There are the Waverley Novels—in direct contemplation, only the talk of an old-fashioned Scotch gentleman, who died a few years ago—or, in a still more gross consideration, but a few masses of printed paper. Yet, in effect, what are they! To how many thousands upon thousands has life been made less painful or more delightful by these charming tales! The world would have gone on without them, no doubt, but it would not have gone on so agreeably. There would have been an infinite deal less happiness in it during the last twenty-five years, if they had not been written. How much has been done for our enjoyment even by one or two of the characters—Caleb Balderstone, for instance, or Dugald Dalgetty, or Dominie Sampson. These are ideal beings, but do we not feel positively richer by knowing them—by having it in our power at any time to call them up before our minds, and inwardly smile at what is ludicrous about them? In like manner, is it not a luxurious sympathy which we feel respecting the fortunes of Ravenswood, all imaginary as he is. These beings take their place among our acquaintance, and the most delightful of all acquaintance they are. We have only to take up a book, and lo we mingle at once in their society, as if unconsciously carried into it through the air. Such books are as show-holes in the walls of this common world, through which to look into one full of the gay, the romantic, and the beautiful. The blind may be slipped aside, and our eye applied, in the smokiest of cottages, as in the most gorgeous of palaces, and the fairy scene will be the same in each case. And we command the show at any time. It will lull us after the excitement and fatigues of labour, and it will beguile us of the languor of monotonous retirement and solitude. We may be sad or joyous, eager and full of hope, or mistrustful of all the good things of life; but our accidental mood is of no consequence when we have once fixed ourselves at the raree-show of the Waverley fictions, for then all of ourselves sinks, except the consciousness of great enjoyment.

Thousands of other things there are in our literature, which we feel to be amongst the most precious of our possessions and privileges. Cowper's Task is as good as an estate to every reading man in the kingdom. There are some of Burns's songs, the loss of which, if it were possible, would be to me more deplorable, as far as I am personally concerned, than the total repeal of the Habeas Corpus Act. The blotting out of the Vicar of Wakefield from most minds, would be more grievous than to know that the island of Borneo had sunk in the sea. The single whimsicality of the gross of green spectacles, and Jenkinson's one piece of learning about the cosmogony, could not be lost without the most serious detriment to all concerned, namely, the whole English public. Certainly, it would be less distressing to lose all our territorial interest in the island of New Zealand, than to cease to know and relish the quiet joke of the vicar respecting his wife's schemings in household economy, that he had not perceived that they ever got any richer by them. Then there is Beau Tibbs in the essays of the same writer, with his shivering nankeens, and that delightful suburban attic, the view from which was so much prized by Bill Squash, the Creole. What would we not give up to retain Beau Tibbs! The poor fellow dined on all that was slight and slender; but he did not feel that he did so from poverty—it was all a matter of taste—he hated your immense

loads of meat, for that was "country all over." Surely, in the recollection of such things we have something still better than solid philosophy. Going back a little farther, how does the heart leap up when we recollect the many admirable things of Fielding and Smollett. Parson Adams himself gilds the whole time. What simplicity, what true goodness!—verily, the world's history gives us few characters equal to him—and yet we feel that he is natural. Poor and ragged is this sturdy son of primitive unvarnished honesty, and he never ceases to be a subject of merriment to the reader—yet how wonderful the effect of genuine virtue, he never ceases to be respectable, even when chased by the squire's dogs, Thunder, Wonder, Plunder, and Blunder, or soused by the waggish doctor in the tub. In the same book, how are we taught to relent in all our stern conventionalities, when the robbed, wounded, and naked Andrews being refused succour by the whole of the inmates of the stage-coach, we are told that "he must have perished, unless the postilion (a lad who has since been transported for robbing a hen-roost) had voluntarily stripped off a great-coat, his only garment, at the same time swearing a great oath (for which he was rebuked by the passengers), 'That he would rather ride in his shirt all his life, than suffer a fellow-creature to lie in so miserable a condition.'" The humours of Partridge—what more is needed than to allude to them! The same of Strap, that most original of humble dependents and faithful followers. Morgan, too, who, when expelled from the presence of the exquisite sea captain for his redolence of tobacco, sat down and only whistled a Welsh ditty. This book is not perfect, certainly; but yet who would give it for many that are, or pretend to be so! Then the dinner after the manner of the ancients. The French cook sinking on his knees, while his master's sword is at his throat, and exclaiming in piteous accents, "Spare me the mortification of the honey and oil!" The "indecent phenomenon" of Pallet sitting transfixed by the atrocious taste of the soup into the attitude of a leaden river god, with the liquor flowing out of both sides of his mouth. The pie of dormice liquored with syrup of white poppies, and the sow's stomach filled with a composition of all else that is horrible, which, when Pallet started up and drew the table-cloth after him, was pitched into the lap of the dainty Italian count. What a flow of grotesque and laughter-compelling images! Turn we from Pickle to Clinker, and how do we find the matter for mirth kept up! The malaprop Jenkins, with her "Oh Molly Jones, Molly Jones!" The tabbiest of tabbies, Tabitha. Lesmahago, most scranky of captains—think of him descending the ladder in his night-gown when the false alarm of fire was given. "Mat," cried the knight, "crown me with oak, or ivy, or laurel, or parsley, or what you will, and acknowledge me to be a *coup de maître* in the way of waggery—ha, ha, ha! Such a *camiscata scagliata beffata*!—O che roba—Oh what a subject! Oh what a caricature! Oh for a Rosa, a Rembrandt, a Schalken! Zooks, I'll give a hundred guineas to have it painted—what a fine descent * *! What lights and shadows! What a group below! What expression above! What an aspect! Did you mind the aspect?—ha, ha, ha!—and the limbs, and the muscles—every toe denoted terror!—ha, ha, ha!—then the blanket! Oh what costume! St Andrew! St Lazarus! St Barnabas!—ha, ha, ha!"

There are some books usually read in youth, and without which youth would not be what it is. Of these are Robinson Crusoe and Gulliver. How youth passed long ago, when there was no Crusoe to waft it away in fancy to the Pacific, and fix it upon the lonely doings of the shipwrecked mariner, is inconceivable;

but we can readily suppose that it must have been essentially different. The first reading of Crusoe is now a feature in every man's biography. Gulliver is not so indispensable, but yet the having him is much to be rejoiced in. Was ever such an air of reality given to the totally extra-natural! This is so perfect in its way, that, once get over the difficulty as to the smallness of the Lilliputians and the bigness of the Brobdingnagians, and every thing else appears as just what was to be expected. In Lilliput, the rations dispensed to the colossal stranger are as much as 1728 ordinary men of the country could eat. Now, this is mathematically what it ought to be, to be in keeping with his comparative size, for, the Lilliputians measuring only inches for feet with Mr Gulliver, we must, in order to find his size as compared to theirs, take the square of 12, which, being cubed, gives exactly 1728. This may give some idea of the care which Swift must have taken to preserve all proper analogies between his hero and the novel beings amongst whom he so-journed. It reminds us of Scott's riding from Stirling to Loch Katrine at a stretch, to make sure that he would be within the bounds of the probable in representing Fitzjames as doing so. Laputa and the Houynhynms are not boys' books; they are satires for men, or rather outlets for the spleen of the unfortunately constituted author. Boys do not understand them, and consequently do not care for them. But what a fund of entertainment there is for us in the two other sections! The affair at the conflagration of the palace is perhaps the very drollest thing in all fact or fiction.

The Arabian Nights' Entertainments are not ours by birth, but they have nevertheless taken their place amongst the similar things of our own which constitute the national literary inheritance. They bring us into a considerably different world from any other we are acquainted with. The caliph, the cadi, the Mahomedan faith, genies, enchanters, are the prominent novelties they display to us. There is a fine want of precise outline about every thing in the book. We see as through some prismatically disturbing medium. What a dreamy romantic grandeur, for instance, in the story of the gold fishes in the lonely lake, and the prince of whose body the lower half had been transformed into black marble. The stories of the dead city and of the magnetic island, which drew out the nails of vessels, and shipwrecked the mariners, are of the same kind. How wild and strange the tale of the calendar on the uninhabited island, to which a merchant comes to immure his son for a year, that he may elude the prophecy which has doomed the youth to destruction within that period—what a sense of ruthless destiny falls on the reader when the accident takes place by which the lad is killed!—and what a distressing sense of pity for the father, who immediately after comes, and finds his body. The whole idea of the three calendars, kings' sons, each blind of an eye, who meet at the gates of Bagdad, is a fine one, filling the mind with a pleasing sense of the inexplicable. All the barber's stories are excellent, from that of Alnaschar who, in his sanguine dream of prospective greatness, kicked over the basket of stoneware which was to be the basis of his fortune, to that of the blind one who was so oddly entertained by the Barmecide. Zobiede figures throughout as a fine specimen of womanly fortitude and good sense, and Haroun is a noble person in all respects. Altogether, it is a glorious book, and one to which we cannot well show enough of respect. Good as it ever was, it is said to be greatly improved in Mr Lane's new edition, which I have not seen, but which I would need to see before I could believe an allegation so contrary to all that could have been presupposed.

The Essayists occupy a conspicuous place in the literature of the last century; but somehow I do not feel disposed to set much store by them. Their fault, or, let us be gentle, their misfortune, is, that they do not relate so much to human nature, as to some of its temporary modes. There is a sad deal too much about hoops and flounces and rolled stockings, and enforcements of little moralities which no gentleman now thinks of disobeying; and then the Flirtillas, and Eudosias, and Eugeniuses, and Hymenæuses, are stiff old frumps at the best. The whole reminds one of an exhibition of wax-work and old dresses. Yet there are fine things amongst them too—Sir Roger de Coverley, for instance, that admirable Old-English gentleman, so humane, so little thinking of the current of the world, so unreflecting on every thing beyond the traditionary habits and duties of his station and locality. Here also we have the majestic moral melancholy of Johnson, and the fine pathos of Mackenzie. But, after all, it must be a selection from that long line of essays which can give pleasure now-a-days.

Come we now to Pope, that prince of sayers of acute and exquisite things—that most mellifluous of all the rhetorical class of poets amongst whom he flourished. Fashion has set him a little aside, which it can never do with an author who has not written in some measure according to a fashion; but he was a fine spirit and a great poet, nevertheless, and English literature would show a mighty blank indeed, were he taken out of it. What nicety in his Essay on Criticism—what brilliant polish in his Rape of the Lock—what superb sorrow and passion in Eloisa, where the feeling is almost made true by its vehemence, in spite of the constantly counteracting influence of the diction—what penetration and expansiveness of view in the Essay on Man—and what a splendid English epic in the translation of the Iliad! The verses to the memory of the unfortunate lady alone would stamp Pope a poet, if there were nothing else to make him out that, as well as a great ethical writer. The Dunciad and all the other satires may be given up—they are decidedly *not pleasing*. But the remainder of his writings are a precious possession of the people in whose tongue they were written; and such, no doubt, they will ever be. Dryden is even better than Pope. He has immense masculine energies. There is a lashing strength about his verse that no other writer approaches. His works are the farewell of the sound old English, for which the stiffened and glistened language of the last century was the substitute, and which there has latterly been a disposition to revive. Dryden is also much out of view, but most undeservedly. Few know what a treasure of thought and expression lies in his *Liind* and *Panther* and *Fables*. We are apt, in the large attention we pay to modern literature, to set down him and Pope in our minds as scarcely poets at all, or at the best good versifiers; but when we open their works, and actually read them, we cease to wonder that our fathers and grandfathers talked of these men as something only a little lower than the gods.

Going back only a little farther, we come to Milton, with his grand Christian poem—to Butler, with his *Hudibras*, the wit of which is so exquisite as to become poetry—to Waller, and Cowley, and Herbert, and Herrick. Then to the cavalier poets Lovelace, Suckling, and Carew, who loved their unfortunate master with a zeal which was in itself more poetical than the nine-tenths of even good verse. Next in retrogression, we find the dramatists—the English dramatists, for they only are English—He whose name is too trite from extremity of fame to be mentioned, the learned Jonson, the sweet Fletcher, the soul-harrowing Ford, and the romantic Webster. A little earlier, and we have Spenser, with his endless tissue of beautiful allegory—a little earlier still, we have the fathers of their era, Surry and Wyatt. Before this time, some giants loom through the obscurity that has invested them. There is the admirable Scottish Dunbar, a poet of manners and morals little behind Pope. There is Chaucer, one of the most correct and unaffected of poetical painters, and only neglected because his language has ceased to be understood. And, finally, there is Barbour, the writer of a most delightful epic, which has all the advantage of being a true history—namely, *The Bruce*.

A class of compositions altogether apart from all that have yet been adverted to, remains to be noticed. These are the songs and ballads, whether of England or of Scotland. No era can be mentioned for these compositions: they have glimpsed forth from the darkness of past ages, as stars come by night into the sky, without any one being able to tell exactly when they first became visible. No authors' names can be mentioned for them: they have sprung forth like the unbidden beauty of the prairie, which no one can tell how it became planted. Involuntary gushings they would appear to have been of that "faculty divine," which has resided at all times in the bosoms of the

people, and may or may not have regular professors, as the accident of culture may direct.

Sweet syren, breathe the powerful strain!
*Lochryan's damsel** sails the main;
 The crystal towers enchanted see!
 "Now break," she cries, "ye fairy charms!"
 As round she sails with fond alarms,
 "Now break, and set my true love free!"
 Lord Barnard is to greenwood gone,
 Where fair *Gil Morrice* sits alone,
 And careless combs his yellow hair;
 Ah! mourn the youth, untimely slain!
 The meanest of Lord Barnard's train
 The hunters' mangled head must bear.
 Or change these notes of deep despair,
 For love's more soothing tender air:
 Sing how beneath the greenwood tree,
Brown Adam† love maintained her truth,
 Nor would resign the exiled youth
 For any knight the fair could see.

In these terms did the enthusiast Leyden express that devotion to ballad literature which made him once start away from Edinburgh to the distant vale of the Liddel, on the Border, for the purpose of obtaining from a certain crone but one missing stanza. Nor less are the charms of the song class of our traditionary poetry. The Cowdenknows will be for ever vocal with the sweetest of verse, and the Marion of the Ewe-Buchts must shine as a star unto all time.

What is above written gives but the heads of the wealth which we possess under the name of English literature. The addition of the inferior and yet worthy names would swell the account, like the putting down of ciphers on the right hand side of a number. And is not this substantial wealth, albeit it is not of the kind which the political economists insist so much upon, that kind which, as they say, has an exchangeable value? Does any man think otherwise, let him only reflect what would be our condition, if no literature, ancient or modern, existed. The accumulation of these stores of the thoughts and fancies of eminent minds, is just like the construction of public works in a country; and a country without a literature is like a country in which as yet no roads have been formed, no bridges thrown over rivers, nor any halls of popular assembly built. But England is in both these respects a wealthy country. It has been put by our fathers into our hands, furnished with an amount of physical conveniences and sources of comfort beyond all precedent, and endowed with an intellectual inheritance such as no other country ever had. Evils manifold may affect it, if some will have the case to be so; but, amidst all that troubles her, there still remains, unsullied, intact, ever ready for the solacement of her thinking sons, the deathless productions of her intellectual great.

THE STORY OF GERALDINE,

BY HER FRIEND.

It is now between forty and fifty years since my sister and I were residing near the beautiful village of Carwell, in a romantic part of England, now little visited, but which at that time was at the height of that ephemeral reputation which the most newly-discovered spa is sure to obtain among our novelty-loving countrymen. The bustle and gaiety of Carwell have long passed away: the faculty no longer consider its springs a specific for every mortal malady; nor do the great world, wearied of the splendour of their ancestral halls, hasten to its hotels, and strive, by submitting to temporary inconveniences, to acquire a new zest for the enjoyment of their homes. All is now stillness and solitude, but to my mind's eye it will ever be pictured as the place that it then was, rather than as it now is.

My sister and I were just of age at the time of which I write; we had been left orphans at too early an age to know our loss; and since leaving school, we had passed our time in visiting our numerous connections; but immediately on obtaining possession of the large fortune which, by the will of our father, was to become ours on our twenty-first birth day, we determined to take a beautiful little residence for a few-months, in the immediate neighbourhood of Carwell, and leave our permanent abode for the present undecided. The summer months passed rapidly away, and I believe seldom have any young heiresses so thoroughly enjoyed the adulation and flattery heaped upon heiresses all the world over, as we did. We were expecting to leave our lovely Orange Bower (for so was our cottage called) in about a fortnight, when one bright autumnal morning, finding my sister not ready for breakfast quite so soon as myself, I put on my bonnet, and called my little dog Fanchon, to take a scamper with me through the adjoining lanes, intending to surprise Harriet on my return with the information that a certain circuit had been made in about one-third of the time usually allotted to such an expedition. I had not gone far,

however, before I met a woman whose cottage I had often visited, and who, by the depth of her courtesy, and a certain earnestness of gaze, seemed to say as plainly as any words could speak, "If you were not in such a hurry, Miss Emily, I would tell you something that would interest you very much." I paused, and she immediately began to ask me if I had heard of the dreadful accident that had happened to the morning coach about an hour before. It had been overturned, the coachman and guard killed on the spot, the outside passengers severely injured, and of the inside ones, who were merely a respectable-looking middle-aged woman, and a little child, the former was lying insensible at the inn, while the latter had escaped quite unhurt. In five minutes I found myself in a small room in the little inn near which the accident had happened; the medical man who attended us was already there, and he took me by the hand and said, "Miss Emily, this is no place for you; this poor woman's life is nearly ended; your presence can do her no good; but if you would amuse this little one, it would be a real kindness, for the poor sufferer seems conscious of her sobs, though of nothing else." So saying, he pulled a little girl reluctantly from the farther side of the bed, where her little face had been buried in the counterpane, and led her towards me. At the first glimpse of me, she bounded forward, exclaiming, "Oh, mamma! mamma!" but a second glance was sufficient to convince her of her mistake, and to make her redouble her cries for her dear nurse. I found Fanchon a powerful auxiliary in gaining the attention of my new little friend; and leaving word that I should take her home to breakfast, we hastened thither, and I really think joy at having met with an adventure almost made me forget to feel sorry for the suffering nurse; at least this I know, that when our friend the surgeon came after breakfast to say that all was over, and found me engaged in a regular game of romps with the child, I felt a pang as though her life had fallen a sacrifice to my negligence. There was nothing, he said, by which it could be ascertained to whom the child belonged, or whence she came; there was no luggage that could have belonged to them, and in the nurse's pocket only a very handsome purse, evidently belonging to a lady, containing a few guineas and some silver; the child's clothes, too, were not marked. The outside passengers had none of them come more than a few stages, and did not know how far the woman and child might have travelled; the latter could give no information, but that she was papa's and mamma's little girl, and that their names were papa and mamma, and nothing else; for herself, she seemed to abound in names, for nothing bright or beautiful in earth or air could be mentioned, but she said, "Mamma call me dat." She was Diamond, and Rose, and Eyebright, and Sunbeam; but the name she always gave when asked, was the very undignified one of Cherry. Cherry she affirmed she was, and very angry she grew when we laughed at her. However, we had no doubt that before the day expired, her parents would arrive; at any rate, the accident that had happened would soon reach their ears, and our little Cherry would be taken from us; but day after day, and week after week, passed, and at last the day came, on which we were to leave Carwell, without one inquiry having been made after the sweet child; for sweet, indeed, she was, and to me, at least, possessed of charms I never saw partaken of by any other. The day before we left, I told my sister that, of course, I should not part with our little plaything till her parents found her: she rather wondered at my encumbering myself in such a manner; but you may suppose her objections were not of a very serious nature, as about six months afterwards she became the wife of a gentleman with eight similar encumbrances; it certainly then became my turn rather to wonder, but I do not think she ever had the slightest cause to regret the step she took, any more than I have to regret mine. Before leaving Carwell, I sent my address in London, whither we were going, to all the hotels and lodging-houses, with a particular description of my little Chérie, and had also an account of the accident again inserted in the newspapers.

My Chérie had evidently been most carefully brought up, and the first thing I did on arriving in London was to purchase a blank book, in which I might carefully record every thing the little girl said that might throw any light upon her past life, for I mistrusted my memory too much to rely on it alone; the second thing I did was to have her miniature taken, that should she not meet her parents till too much changed for them to remember her, the miniature might be something to appeal to for what she had been when first brought under my notice.

From the very moment of leaving Carwell, I determined to devote my whole time and attention to the welfare of this beloved child, and I commenced a course of reading that I hoped might qualify me for carrying on her education in a very superior manner. I studied

* See the ballad of the Lass of Lochryan.

† See the ballad of *Brown Adam* in the Border Minstrelsy.

all that Locke and Mrs Chapone, Miss Edgeworth, Hannah More, and Miss Hamilton, had written on the subject, and amused myself with forming schemes, which I thought would combine the advantages of each system without the defects of any. As soon as she became old enough to have a governess, I used great care in the selection of one whom I thought likely to co-operate with me in my plans for conveying the highest degree of polish to the manners, combined with the most solid groundwork of intellectual cultivation. I could, however, seldom retain any governess longer than a few months, my exactions being so very arbitrary, until I received a Mrs Baker, who was every thing that I could wish. This lady was homeless and friendless, and her history interested me so much, that I determined to take her on trial. She had just escaped from France, where she had been a prisoner, and without any means of communicating with her family and friends, for ten tedious years; and when at last, a lonely widow, she reached her native land, it was only to find herself without a friend, and with so small a pittance that active employment was her only resource. I was soon delighted to find the change that took place upon Chérie. Mrs Baker acted in so judicious a manner, and gained so thorough an insight into her character, and so completely regulated her course of instruction by that knowledge, that, when I saw the result, I could not but inwardly resolve to leave her in such excellent hands. Mrs Baker's whole happiness seemed to consist in devoting herself to Chérie; she seldom alluded to her past trials, but when she did, it was always to contrast them with some cause for thankfulness in her present lot; and, on the whole, a more soberly happy trio has seldom passed five years in each other's society. Mrs Baker, from the very first, I found to be no common character, and every month developed new traits which commanded respect and admiration.

When Chérie was about eighteen, I consented to let her pass a few months with my sister, who was going to make a tour through the north of England, while I availed myself of an oft-repeated invitation to visit my friend Lady Marsden, whom I had not seen for many years, though an affectionate correspondence had always been maintained between us. I met with a most cordial reception at Marsden Park, and was so delighted with a beautiful cottage, just outside the Park gates, and looking towards the village green, that, finding it was in want of a tenant, I determined upon renting it, thinking it a favourable pretext for securing a permanent residence for Mrs Baker, by asking her to look after my little household whenever I should be absent; and as I secretly resolved that it should never be my home for very long together, her delicacy would thus be spared the appearance of dependence, which constantly moving about with us would have; besides, I had heard her speak with rapture of the scenery in the neighbourhood, which she said she had visited in the happiest period of her life. I had soon the pleasure of seeing her comfortably installed in the cottage which I longed to bid her call her own, but my kind friends would not hear of my leaving the Park for the present. Among their other guests, was a niece of Lord Marsden's, who lionised me through the old apartments to my very heart's content. We had passed several hours of a long wet morning in a room in the old part of the building, filled with family pictures of those long since gone, like the withered flower (to borrow Herbert's beautiful idea), to revisit their mother earth, but with each of whom Fanny Milton seemed as intimately acquainted as if they were beings of the present generation, and of whose blighted hopes and disappointed fears she had many a thrilling legend to tell; when she said, "Do you know I have a very bold scheme in my mind: I am quite determined to smuggle you into a room where no one but my poor uncle has entered for many years: there is a picture there of his first wife, who, with her only child, was lost at sea, as you know; it is in the first Lady Marsden's dressing-room, and my uncle has never permitted any one to go into it since. He visits it daily, and I can always tell when he has been there, he looks so thoughtful and sad. I often wonder if his present fair lady knows of its existence, at least if she is aware what the room contains, for she must know he often shuts himself up there. I have sometimes thought I would ask her, but I have been checked by a fear of making her jealous. But," she added, laughing, "I have my revenge in store if ever she vexes me, that's all." "But," I said, "how can we possibly obtain access to the room, when even Lady Marsden is not allowed to enter it?" "Oh! leave that to me," she replied; "I go whenever I hear my uncle leave the room, to see if the key is left in the door, and once in every four or five visits I have always been so fortunate as to find it there; and it is so long since I got in, I have a presentiment it will not be long before I manage it again."

About three weeks after this, I was fast asleep one night, when I was awoken by Fanny Milton standing beside me, and saying, "Come, come, Miss Montague, the key is in the door, and I have been waiting till I was quite sure my uncle would be gone to bed; but you must be quick, for my candle will soon be burnt out, and yours, I see, is quite so; but take care you make no noise." There was something very solemn in entering the chamber of the dead clandestinely, and at such an hour too. "How I wish it was daylight!" said Fanny; "this paltry tallow candle is but a poor substitute for the beams of the sun, for I have seldom seen any picture placed in so advantageous a light as this, when the shutters are open." Much as I should have

liked, at any other time, to have looked round this desolate apartment, yet our candle was burning too low in its socket to admit of my noticing any thing but the one object I was come to see. I had only time to take one wistful gaze at the lovely lady, and her sweet child who nestled in her bosom, when our candle suddenly went out, and left us in total darkness. I groped my way back to bed alone (Fanny's room being in an opposite direction to mine), but it was not to sleep; so long a night I never passed in the whole course of my existence; and when day at last dawned, still I thought the hour would never come when I might descend to the library with any hope of finding Lord Marsden there. At last I went down, but found it empty, and I began to fear that he was that morning going to depart from his established rule, of reading there for an hour before breakfast. At length he came, and summoning up all my courage, "Lord Marsden," I said, "I should apologise for my intrusion into a room where I believe you allow no one to enter but yourself; but I trust you will have to thank me for my boldness till your dying day, for I think I cannot be mistaken in saying that this (putting the miniature, which I always carried about with me, into his hands) that this is indeed your long lost little Geraldine." "There is no doubt that it is a most excellent copy of the likeness of my little girl," he said, with a mournful smile; "but I do not quite understand you, Miss Montague," and he looked at me as if he thought I were somewhat beside myself. "Do endeavour to compose yourself," he added, as I burst into tears; "if this miniature has been done by you, I assure you I shall value it very much, for it really is almost more like my dear, dear child, than the picture up stairs."

"Oh, Lord Marsden!" I passionately exclaimed, "why will you not understand me? I mean that Geraldine was not drowned, but that she is my own dear Chérie, of whom you so often have heard me speak." I almost repented having spoken so abruptly, for he looked for a moment so wildly perplexed, that I really feared reason would give way; but, making a violent effort to compose himself, he begged me to tell him, as briefly as possible, the whole history of my little founding. "It is indeed strange," he said, when I had concluded, "but I dare hardly trust to my newly formed hopes; for how the nurse and child escaped, while the mother perished, it baffles me to tell." I too was baffled, but when the purse found in the nurse's pocket was produced, and a similar one, half finished, was found in the work-table of Geraldine's mother, no doubt could remain that it was indeed herself. Ere an hour had passed, Lord Marsden was on his way to the Lakes for his daughter, and I was at the cottage, pouring forth into the ear of Mrs Baker the momentous history of the last eight hours. To my astonishment and vexation, she received the intelligence I had to communicate with any thing but joy, and after a few ineffectual struggles to conceal her tears, she gave way to a perfect paroxysm of weeping, exclaiming that Geraldine was now for ever lost to her. "Oh!" she said, "how have I dreaded this day!—come I knew it must, sooner or later; and, oh! what struggles have I had to keep the dreadful secret from her!" I rose in extreme indignation. "And you, Mrs Baker, then have known the secret of your pupil's birth, and have had the meanness to conceal that, from her and myself, which was alone wanting to complete our happiness." She could hardly persuade me to listen to any explanation, so angry was I with her for her concealment. "When you know all," she said, "your blame will be changed into pity. Only promise to repeat to no mortal ear what I say, and I will tell you every thing." I willingly promised, for curiosity will often in a moment subdue, or at least hold in abeyance, the angry passions. "You little thought," she said, "to whom you had given a home. I am Geraldine's mother. Oh! the anguish I have suffered in not daring even to call her Geraldine, and in hearing her conjectures as to who her mother was!" Her sobs almost prevented her speaking, and she looked so really ill, that I willingly consented to her proposal that she should, in the course of the day, send me a written account of her mysterious disappearance for so many years. On my return to the Park, I shut myself up in my own room, pleading the restless excitement I had endured during the night, as my excuse for the fatigue I felt. Thankful was I to hide my feelings from every human eye, till I could in some measure compose myself, and look with a degree of calmness at the strange position in which I stood, as the confidante of Mrs Baker.

In a few hours her letter arrived. I need not transcribe the whole of it. It mentioned that Lord Marsden having left her and Geraldine on a visit with a friend in North Wales, had gone over to Ireland, where he has large estates. While there, she received from a friend in Cork so alarming an account of Lord Marsden's state of health, that she determined instantly to join him. She had a man-servant with her, whom she considered sufficient protection, though she had never in her life undertaken even the shortest journey without having had considerable arrangements made for her; but all difficulties vanished before her earnest desire to rejoin her husband. When she reached Holyhead, she found that the packet had just sailed, and that there would not be another for a fortnight. She had incidentally heard a few days before, that there were packets from Plymouth to Cork every fortnight; so, regardless of the fatigue, she resolved to hasten thither, writing, however, a hurried letter to Lord Marsden, to go by the Holyhead packet, and informing him of her intention, as she thought it possible, after all,

that it might arrive before herself. When she reached Shrewsbury, however, she resolved to send the nurse and child to Carwell, as she feared the long journey might be injurious to the child, and she knew some intimate friends of her own sex were there who would look after her. She had not time to write to them, but they knew the nurse, and she was to tell them she would write from Plymouth. Most unfortunately, when she reached Plymouth, the vessel was on the point of sailing. She hastened on board, where she soon made the discovery that it was not intended for the accommodation of lady passengers at any rate; but the captain, a coarse, and as she soon began to fear, an ignorant man, was too glad to secure the large sum which the eagerness of the lady made him demand for her passage, to hint to her that it was no place for her. A violent storm came on the next day, which drove them completely out of their course; and after it had subsided, while the captain and crew were all in a state of brutal intoxication, they were taken by a French vessel. Her servant, the only one who offered any resistance, fell dead at her feet, declaring, he hoped they would rather kill his honoured lady than make a prisoner of her. Captivity, however, was her fate.

While in France, she in vain endeavoured to communicate with Lord Marsden; and after ten years of banishment, when, with great difficulty, she succeeded in reaching her own country, the first newspaper she took up contained the marriage of Lord Marsden. "Oh, what a withering of hope was there!" she said; "but I could not for a moment think of intruding a knowledge of my existence on a husband who seemed to have forgot me. I had loved him too dearly to blight his happiness now. I wrote to our banker in London, whom I knew to be a conscientious man; and having first obtained a promise in writing that he would inviolably keep the secret I had to confide, I entreated him to obtain for me, if possible, a situation as companion, or governess; the latter, by a strange accident, I found with you, to take charge of my own daughter. You will now, therefore, understand the depth and reality of the thankfulness which you have so often heard me express to that Providence which so mercifully provided a refuge for me in your house."

The letter concluded with many protestations of gratitude, which it made me blush to read, when I thought how little I felt to that Being who had brought me so far through life without, I may say, a single trial. These reflections, I trust, have not been lost upon me, but have influenced my whole subsequent life.

After Geraldine's return, there was one continued scene of gaiety and festivity at the Park for many weeks, but amidst it all, Geraldine found time to spend some hours each day at the cottage, and I was delighted to observe, that she seemed to love her unknown mother even more tenderly than she had done as little Chérie. Mrs Baker refused all invitations to the Park, and though she always received Lady Marsden's visits with politeness, there never seemed on either part any disposition to an intimacy. Lady Marsden's manner, indeed, altogether surprised me; her remarkably buoyant spirits seemed to forsake her from the hour of Geraldine's return, and she had an abstracted look, and an appearance of constraint, that distressed me. Fanny Milton told me she saw plainly her conjectures respecting her jealousy were but too true; for now that that room was Geraldine's, Lord Marsden was more there than ever. I could not forbear, from my friendship for Lady Marsden, urging her to alter her manner, assuring her the harsh uncharitable world would impute the change to a wrong cause; and though I knew that she indeed loved Geraldine, as though she were her own child, others would suppose it was otherwise. I saw she endeavoured to rally her spirits, but the effort was without success. Not a day passed but some little present was sent by Lord and Lady Marsden to Mrs Baker, and she, who really seemed grateful for the smallest attention from them, sent in return little ornaments for Lady Marsden, of French work, and not unfrequently little ails of her own, often accompanied by beautiful words, which she had written herself. Lady Marsden soon fell into bad health, and at length was ordered to try a warmer climate. She was taken with great care to Madeira, but she had resided only a month in that island, when she died. Some time afterwards I received a packet which had been found in her desk, in which she owned that the cause of her dejection was, a thought had strongly impressed her, that since the child had been saved, the mother might be so also; she said she durst hardly acknowledge her fears even to herself, but they had preyed upon her, so as to take all comfort from her life.

Lord Marsden did not long survive his lamented lady. In returning home from Madeira, he had taken a cold which settled on his lungs, and he died, to the regret of all who knew him. His long self-denying wife, poor Mrs Baker, came to see him just in time to receive one look of recognition, and then his eyes closed for ever. Poor Geraldine! it was indeed a trying day to lose a father and find a mother at once. The joy of the neighbourhood was unbounded at finding Lady Marsden again restored to them; rich and poor flocked to see her, as soon as propriety would permit; and many of her poor aged pensioners in the village, who had often wished Mrs Baker had known the first Lady Marsden, that she might listen with more complacency to their praises of her, wept tears of joy at seeing their dear benefactress once more among them. She now reaped a rich harvest from the care she had bestowed upon Geraldine, who has ever felt that her debt of gratitude

to her mother can never be repaid. Never have I seen mingled respect and confidence so beautifully developed as in Geraldine's behaviour to her mother; how she could gratify her feelings has been the chief object of her life ever since she found her parent, and this she has accomplished without neglecting one relative duty which her marriage or her station in life has imposed upon her.

FLOATING GARDENS AND ISLANDS.

CASHMERE, so celebrated in the East for its romantic beauties and fertile soil, is an appendage of Afghanistan, an extensive and powerful kingdom of Asia, situated between Hindostan and Persia. Cashmere forms one vast valley encircled by lofty mountains (a part of the Himalah range), and extends about ninety miles in length, by from forty to seventy miles in breadth. This great natural hollow affords an excellent illustration of the changes which the surface of the globe is continually undergoing by existing causes. Formerly it was one immense lake, as is clearly shown by horizontal lines running along the face of the mountain on both sides, which mark the gradual subsidence of the waters. So far scientific travellers assert; but tradition of high antiquity goes still further. It asserts, that into this immense basin flowed all the rivers of the surrounding mountains, carrying with them large quantities of soil; but that at length the lake burst for itself a passage through the rocky barrier which confined it, leaving the hollow filled up to a considerable extent with rich alluvium. The extraordinary fertility of the soil warrants the conclusion that at one time an immense quantity of debris was brought thither from the surrounding elevations; but that the subsidence of the waters was gradual, not sudden, is proved by the lines which are traced, as it were like sheep-paths, along the mountain side.

Water or marshy ground still occupies a portion of the valley. The city of Cashmere itself is situated in the midst of numerous lakes, connected with each other, and with the river Vidusta, by canals, separated by narrow lines and insulated plots of ground. Some parts of the city are sufficiently elevated above the water-line to be out of danger on any rise of the water; but the greater portion lies so low, that in considerable inundations, which are far from uncommon, it is liable to be flooded. The depth of the lakes is in the course of being gradually diminished by the accumulated growth of weeds and aquatic plants, and the steady deposition of mud; the surface of the lakes is thus increased, so that the inundations have become annually more frequent, and spread to a greater extent than formerly. These circumstances have suggested to the inhabitants an expedient by which certain vegetables are cultivated in safety, that is, in such a manner as to be afforded as much moisture as they require, without exposure to the risk of being destroyed. Of the method of forming these floating gardens, Mr Moorcroft gives us a very explicit account in his "Notices of the Natural Productions and Agriculture of Cashmere." It is effected, he informs us, through the medium of a floating support, of which the buoyancy and flexibility prevent the plants sinking into the mass, or being partially covered with it. Various aquatic plants spring from the bottom of the lakes, such as water-lilies, convolvuluses, sedges, reeds, and the like; and as the boats which traverse these waters take generally the shortest lines they can pursue to the place of their destination, the lakes are in some parts cut, as it were, into avenues separated by beds of sedges and reeds. In these places, then, the farmer establishes his cucumber and melon floats, by cutting off the roots of the aquatic plants just mentioned about two feet under the water, so that they completely lose all connection with the bottom of the lake, but still continue attached to each other. When thus separated from the soil, they are pressed into closer contact, and formed into beds of about two yards in breadth, and of an indefinite length. The heads of the sedges, reeds, and other plants of the float, are next cut off, placed upon its surface, and then overlaid with a thin coat of mud, which is left gradually to insinuate itself into the mass of matted stems. The bed floats, but is prevented from drifting about by a stake of willow being driven through it at each end, which admits of its rising and falling, in accommodation to the rise and fall of the water.

The gardens are now in a state of complete preparation for the reception of the vegetable to be raised. The gardener has in readiness a number of cucumber and melon plants, which have been raised under mats; and of these, as soon as they have got four leaves, he places them on the floating mass, at about two feet distance from each other. The labour is now completed, no further care being necessary but that of collecting the fruit. The whole expense is confined to the value of the labour, which is exceedingly trifling, as the work is soon done. Perhaps a more economical method of raising cucumbers cannot be devised. For the most part, the islands will bear a man's weight, but generally the fruit is picked off by a person sitting in a boat. "I traversed," says Mr Moorcroft, "a tract of about fifty acres of these floating gardens in cucumbers and melons, and saw not above half a dozen unhealthy plants; nor have I seen in the cucumber and melon grounds, in the vicinity of very populous cities in Europe or in Asia, so large an expanse of plants in a state equally healthy, though it must be observed running into somewhat too great

luxuriance of growth." Mr Moorcroft goes on to say that this method of culture might be advantageously extended to other plants besides those mentioned, and observes:—"The traveller who finds the water-melon of vast size, buried in the hot and dry sand of the desert, would not be readily tempted to conclude that it could be raised in nearly equal luxuriance of growth in the cool and humid atmosphere of a floating garden. Yet the fact points out an accommodating power in the constitution of this plant, which may be as largely found in others where at present it has not been supposed to reside. And the subject is of extreme importance, the water-surface of our islands having never been suitably called upon to contribute its share of produce to the maintenance of our population." We take the liberty of doubting the conclusions of this writer, as respects this country, for we fear that our climate will prove unsuitable to produce any vegetable of general use on such watery localities.

Floating islands are by no means uncommon. They are found in almost every part of the world, and their general history occupies no inconsiderable portion of the writings of the earlier geographers. The space which they fill, however, is proportioned rather to the wonder which the idea of such a thing excites, than to their economic importance. They are simply formed by the roots of plants and trees interlacing with each other, and thus, as in the case of the floating gardens of Cashmere, constituting a support for layers of earth. After having been undermined or torn away by the waters from the banks, or bottoms of lakes, to which they were attached, by their lightness and spongy consistency, joined to their inconsiderable thickness, they remain buoyant on the surface of the waters. Our own beautiful lake, Loch Lomond, contains several of them, and they are found in other sheets of water in Scotland, and also in Ireland. A small lake in Artois, near Saint Omer, is covered with floating islands. The marshy lakes of Comacchio, situated near the Gulf of Venice, present a great number; indeed, it is in such boggy situations that they are most likely to be formed. The most considerable noticed any where are those of the Lake of Gerdau in Prussia, which furnish pasturage for one hundred head of cattle; and that of the Lake of Kolk, in the country of Osnabruck, which is covered with beautiful elms. Some of these floating islands appear and disappear alternately. The Lake Ralang, in Smalande, a province of Sweden, encloses a floating island, which, from 1696 to 1766, has shown itself ten times, generally in the months of September and October. It is two hundred and eighty feet in length, by two hundred and twenty in breadth. There is an island similar to it in Ostrogothia; and we have seen a small one on Derwent water in Cumberland.

A TASTE FOR READING.

In an admirable speech on the subject of common-school education, delivered by Governor Everett at a late public meeting at Taunton, Bristol county, in one of the New-England states, the following passages occur on the cultivation of a taste for reading:—

"It is a great mistake to suppose that it is necessary to be a professional man, in order to have leisure to indulge a taste for reading. Far otherwise. I believe the mechanic, the engineer, the husbandman, the trader, have quite as much leisure as the average of men in the learned professions. I know some men busily engaged in these different callings of active life, whose minds are well stored with various useful knowledge, acquired from books. There would be more such men, if education in our common-schools were, as it well might be, of a higher order; and if common-school libraries, well furnished, were introduced into every district, as I trust in due time they will be. It is surprising, sir, how much may be effected, even under the most unfavourable circumstances, for the improvement of the mind, by a person resolutely bent on the acquisition of knowledge. A letter has lately been put into my hands, bearing date the 6th of September, so interesting in itself, and so strongly illustrative of this point, that I will read a portion of it; though it was written, I am sure, without the least view to publicity.

"I was the youngest (says the writer) of many brethren, and my parents were poor. My means of education were limited to the advantages of a district school, and these, again, were circumscribed by my father's death, which deprived me, at the age of fifteen, of those scanty opportunities which I had previously enjoyed. A few months after his decease, I apprenticed myself to a blacksmith in my native village. Thither I carried an indomitable taste for reading, which I had previously acquired through the medium of the society library; all the historical works in which, I had at that time perused. At the expiration of a little more than half my apprenticeship, I suddenly conceived the idea of studying Latin. Through the assistance of an elder brother, who had himself obtained a collegiate education by his own exertions, I completed my Virgil during the evenings of one winter. After some time devoted to Cicero, and a few other Latin authors, I commenced the Greek. At this time it was necessary that I should devote every hour of daylight, and a part of the evening, to the duties of my apprenticeship. Still I carried my Greek grammar in my hat, and often found a moment, when I was heating some large iron, when I could place my book open before me against the chimney of my forge, and go through with *tupeio, tupeio, tupeio*, unperceived by my fellow apprentices, and, to my confusion of face, with a detrimental effect to the charge in my fire. At evening, I sat down, unassisted and alone, to the Iliad of Homer, twenty books of which

measured my progress in that language during the evenings of another winter. I next turned to the modern languages, and was much gratified to learn that my knowledge of the Latin furnished me with a key to the literature of most of the languages of Europe. This circumstance gave a new impulse to the desire of acquainting myself with the philosophy, derivation, and affinity of the different European tongues. I could not be reconciled to limit myself in these investigations to a few hours after the arduous labours of the day. I therefore laid down my hammer and went to New Haven, where I resorted to native teachers in French, Spanish, German, and Italian. I returned at the expiration of two years to the forge, bringing with me such books in those languages as I could procure. When I had read these books through, I commenced the Hebrew with an awakened desire of examining another field; and, by assiduous application, I was enabled in a few weeks to read this language with such facility, that I allotted it to myself as a task, to read two chapters in the Hebrew Bible before breakfast each morning; this, and an hour at noon, being all the time that I could devote to myself during the day. After becoming somewhat familiar with this language, I looked around me for the means of initiating myself into the fields of oriental literature, and, to my deep regret and concern, I found my progress in this direction hedged up by the want of requisite books. I immediately began to devise means of obviating this obstacle; and after many plans I concluded to seek a place as a sailor on board some ship bound to Europe, thinking in this way to have opportunities of collecting at different ports such works in the modern and oriental languages as I found necessary for this object. I left the forge and my native place to carry this plan into execution. I travelled on foot to Boston, a distance of more than a hundred miles, to find some vessel bound to Europe. In this I was disappointed, and while revolving in my mind what steps next to take, I accidentally heard of the Hall of the American Antiquarian Society in Worcester. I immediately bent my steps towards this place. I visited the Hall, and found there, to my infinite gratification, such a collection of ancient, modern, and oriental languages, as I never before conceived to be collected in one place; and, sir, you may imagine with what sentiments of gratitude I was affected, when, upon evincing a desire to examine some of these rich and rare works, I was kindly invited to an unlimited participation in all the benefits of this noble institution. Availing myself of the kindness of the directors, I spend about three hours daily at the Hall, which, with an hour at noon, and about three in the evening, make up the portion of the day which I appropriate to my studies, the rest being occupied in arduous manual labour. Through the facilities afforded by this institution, I have been able to add so much to my previous acquaintance with the ancient, modern, and oriental languages, as to be able to read upwards of fifty of them, with more or less facility."

I trust I shall be pardoned by the ingenious author of this letter, and the gentleman to whom it is addressed, for the liberty I have taken, unexpected, I am sure, by both of them, in thus making it public. It discloses a resolute purpose of improvement (under obstacles and difficulties of no ordinary kind), which excites my admiration, I may say my veneration. It is enough to make one who has had good opportunities for education, hang his head in shame."

A FEW WEEKS ON THE CONTINENT.

COBLENTZ TO MAYENCE.

COBLENTZ—the Confluentia of the Romans—occupies a situation of great beauty on the triangular point of land formed by the junction of the Moselle with the Rhine. The latter river rises in France, and after a winding course of three hundred miles through much picturesque scenery, and passing several ancient towns—among the rest Treves—here falls into the Rhine. The wines produced in the countries on its banks are celebrated for a light pleasant flavour and high aroma, and are chiefly sent to Coblenz for exportation. Both as a centering point for the traffic of the valley of the Moselle, and for the populous district on the middle Rhine, the situation of Coblenz is favourable for commerce; but, unfortunately, from political causes, and particularly from the military character of the place, comparatively little advantage is derived from the excellence of its locality. At present, it possesses 14,000 inhabitants, and a garrison of 4000 men.

It is impossible to pay a visit of only a few hours to Coblenz, without being affected by a sense of the evils incidental to the maintenance of a warlike attitude. Wherever we turn our eyes, we behold the appearances of armed force. Instead of seeing a town generously unboasting itself with ample quays on the Rhine and Moselle, we perceive high loop-holed walls rising along the margins of these fine deep waters, absolutely shutting out commerce, and leaving a petty traffic from a few boats to be carried on by a kind of sufferance at a quay of trifling dimensions situated near the central outlet from the town. Instead of seeing a town stretching freely away into the country behind, and possessing environs embellished with the villas of gentry and merchants, we perceive a closely packed cluster of streets, bounded by ramparts and ditches, and guarded with cannon. Amidst such emblems of barbarism and violence, it excites no surprise to see thoroughfares, mean, foul, and swarming with a

miserable population; even the more elegant and modern parts of the town are marked by certain symptoms of neglect and ruin. The condition of Coblenz is very hopeless. It is the centre-point of a cluster of armed fortresses, forming the impregnable bulwark of Prussia, and must of course follow the fate of that kingdom. First in the list of these military strengths, is Fort Kaiser Franz on the opposite side of the Moselle, flanked by two smaller forts, the Moselle Arrow and Nuendorf—the three guarding the route by the Moselle, and the route to Cologne. Second, Forts Alexander and Constantine, situated on a rising ground overhanging the town on the inland side. Third, and last, the Fort of Ehrenbreitstein, which occupies a broad rocky mount on the opposite side of the Rhine, the valley of which it sweeps right and left, besides commanding the country behind. On looking around, therefore, from the walls of Coblenz, we find ourselves in the heart of, perhaps, the very strongest military post in the world, that of Gibraltar or Malta not excepted.

The rocky knoll of Ehrenbreitstein (the broad stone of honour), with its wreathing loop-holed walls bristling with cannon, rises almost closely from the river on its right bank, and both in height and aspect reminds us of Edinburgh Castle. The fort has long been celebrated for its powers of defence. In the wars of Louis XIV., it held out against and defied that monarch, with all the force he could bring against it. In the wars of the French republic (1793-99), it also held long out against the best generals of France, but was ultimately delivered up in consequence of famine. To such extremities was the garrison reduced by hunger before yielding up the place, that the flesh of cats and horses was sold at from a shilling to two shillings a pound. The French retained the fort till 1801, when they abandoned it, and blew it up. Latterly, it has been rebuilt according to the best principles of fortification. The lines of Byron, commemorative of its shattered condition, will recur to recollection:—

Here Ehrenbreitstein, with her shatter'd wall
Black with the miner's blast, upon her height
Yet shows of what she was, when shell and ball
Rebounding idly on her strength did light:
A tower of victory! from whence the flight
Of baffled foes was watch'd along the plain:
But Peace destroyed what War could never blight,
And laid those proud roofs bare to Summer's rain—
On which the iron shower, for years, had pour'd in vain.

At the foot of rocky precipices, and close upon the Rhine, stands the small town of Ehrenbreitstein—in which, by the way, facing the river, there is an excellent quiet hotel, the Weissen Ross, or White Horse, which I can, from experience, recommend to travellers. The communication between this side of the Rhine and Coblenz, is kept up by means of a platform bridge laid on thirty-seven stout barges, moored in the stream, and measuring 485 paces in length. Following the course of the Rhine up to this point, the country on both banks has belonged to Prussia, but a short way above Ehrenbreitstein, the right bank ceases to belong to that power, and forms part of the duchy of Nassau.

Coblenz is connected with the left bank of the Moselle by a stone bridge of thirteen arches, which are so lofty that the vessels which navigate the stream do not require to lower their masts in passing below them. The view from the bridge up the serpentine course of the Moselle, embraces a landscape of soft beauty, with Fort Kaiser Franz, and a line of picturesque hills in the distance. The waters of the Moselle, at the period of my visit, though not "blue," or any colour but a dull yellow, were all that a poet could wish; and I have little doubt that the banks would be as charming by the "starry light of a summer's night" as they were when lighted up by the declining sun of an autumnal evening. Crossing the Moselle by its massive stone bridge, and passing a rather attractive suburb on the left bank of the stream, we are speedily led to a rising ground, where stands the monument erected over the remains of Marceau, a young general of the French republican army, who was killed at the battle of Altenkirchen, on the 21st of September 1796. At the interment of his body, both French and Austrians, friends and enemies, attended to do honour to departed worth:—

By Coblenz, on a rise of gentle ground,
There is a small and simple pyramid,
Crowning the summit of the verdant mound;
Beneath its base are heroes' ashes hid,
Our enemy's—but let not that forbid
Honour to Marceau! o'er whose early tomb
Tears, big tears, gush'd from the rough soldier's lid,
Lamenting and yet envying such a doom,
Falling for France, whose rights he battled to resume.

Brief, brave, and glorious was his young career—
His mourners were two hosts, his friends and foes;
And fitly may the stranger linger here
Pray for his gallant spirit's bright repose;
For he was Freedom's champion, one of those,
The few in number, who had not o'erstept
The charter to chastise which she bestows
On such as wield her weapons; he had kept
The whiteness of his soul, and thus men o'er him wept.

BYRON.

Returning from this interesting part of the environs of Coblenz, we paid a passing visit to the ancient church of St Castor, a lofty structure with four towers standing on the point of land at the junction of the Moselle and Rhine. St Castor's is an exceedingly old church: it was originally built in the year 836, with foundations resting on Corinthian pillars, and within its walls, in 843, the grandsons of the Emperor Charlemagne met to divide his possessions into Germany, France, and Italy. The church has been partially modernised, particularly at its entrance porch, and does not seem older than the common order of Gothic buildings. Its millennial jubilee was celebrated with great solemnity in 1836. The miserable-looking open square in front of the church, or Casterhof, as it is termed, contains an object of historical interest which is visited by most strangers. This is a substantial stone fountain, which was erected during the occupation of the town by the French in 1812. According to an inscription upon its side, it was erected by Jules Doazan, the French prefect of the department, to commemorate the expedition of Napoleon to Russia. The amusing thing about it is, that the town afterwards fell into the hands of the Russians, and the Russian commandant has inscribed a wickedly satirical effusion below the inscription of the Frenchman. The two inscriptions stand literally as follow:—

An. MDCCCXII.

Memorable par le Campagne

Contre les Russes,

Sous le prefecture de Jules Doazan.

Vu et approuve par nous, Commandant Russe,
de la ville de Coblenz
Le 1 Janvier 1814.

Seen and approved by us, the Russian commandant of the town of Coblenz, the 1st of January 1814! One could hardly have expected such an admirable piece of railery from a Russian; but in 1814 the Russians could afford to laugh at France.

During the excursion-season in summer and autumn, the shore of the Rhine at Coblenz exhibits a busy scene of arrival and departure of steam-boats; and from this point travellers have an opportunity of proceeding in various directions in search of the picturesque. Such are the arrangements of the steam-boat companies, that tourists from Cologne may either proceed directly onward to Mayence without stopping, or stop all night at Coblenz, and proceed in the morning. The journey from Cologne, however, which occupies an entire day, is quite sufficient to fatigue the tourist, and he wisely betakes himself to a hotel, to wait till the morning's light brings a renewal of his toil. The steam-vessels, both of the Rhine and Moselle, lie at the small quay below the bridge of boats, and are reached by a platform or gangway, resting on several barges moored in the water. This is a species of jetty to be seen at various places on the Rhine, and I beg to recommend it as worthy of imitation at places in our own country, where regular piers for the accommodation of passengers do not exist.

Early on the morning of our departure from Coblenz, we secured our places in an excellent steamer, which lay hissing at one of these convenient barge jetties, and the bridge of boats across the river being opened to allow a passage up the stream, our vessel set merrily off on its trip to Mayence. The district of Rhine scenery lying between Coblenz and Mayence, is much more picturesque than that farther down the river. The banks are for the greater part more rocky and precipitous, and shoot up in rugged conical mounts, or vine-clad steeples, from the brink of the stream. Still, however, a highway pursues the edge of the river, along the left or Prussian bank; the solid rock being in various places cut away with great labour and expense, to permit its continuous course. There is also a road on the right or Nassau bank, but it is neither so regular nor so complete as the other. For those who have time to spend in performing the journey upwards by these land routes, stopping at villages and old castles by the way, and inspecting the scenery from the heights above the river, a much more interesting tour may be executed than by sailing in the steam-vessels; but the latter mode of journeying will be found much the easiest, the cheapest, and, I believe, except to decided view-hunters, the most satisfactory in every respect.

The view of the Rhine looking upwards from Coblenz, I have already described as being exceedingly beautiful. At the head of the open reach through which the steamer now threads its way, passing in its course the pretty island of Oberwerth, we perceive, perched on a rocky height on the left bank, the magnificent ruin of Stolzenfels, a castle supposed to have been built in the thirteenth century, and which was destroyed by the French about the year 1690. Immediately opposite is the valley of the Lahn, a river of Hesse and Nassau, which here adds its waters to the Rhine. The banks of the Lahn are equally romantic with those of the Rhine, and are as interesting from the number of old towns and castles. The opening of the valley is strikingly marked by the ancient church of St John standing on the point of land at the

junction of the Lahn with the Rhine, and beyond is seen Niederlahnstein, the first of the towns of Nassau; opposite, on a craggy knoll on the left bank of the Lahn, is the old picturesque ruin of Lahneck castle, which, with that of Stolzenfels across the Rhine, reminds us of the castle of Drachenfels, and its opposite guardian of the pass, Rolandseck. Passing these imposing memorials of a time of feudal warfare, and their respective old villages beneath them, we proceed up a tolerably long reach of the river, between banks richly clad with vine gardens, and are soon opposite Rhenze, a little old town, on the left bank. This is a spot of historical interest. At the distance of three or four hundred paces below Rhenze, and close to the road, are still to be seen four stones of moderate dimensions, part of the ancient and venerable monument called Königstuhle, where the electors of the Rhine frequently assembled to deliberate on the interests of Germany. Unfortunately, the edifice, which was an octagon resting on pillars, was destroyed by the French in 1794. A short way beyond Rhenze we come to the ancient castle of Marksburg, which is still entire, and stands on the top of a high rocky mount overhanging the river on its right bank. It is occupied as a state prison of Nassau.

The Rhine now makes a considerable bend, and we are carried in front of the town and castle of Liebenck. A little farther on, after making another serpentine turn, and passing two or three villages, the vessel approaches the populous, but old and decayed town of Boppard, on the left bank; above the town is an ancient large edifice, once a nunnery, but now forming a cotton-spinning factory. Next, on the right bank, we pass the romantic ruins of two castles, Sternberg and Liebenstein, planted on the summit of two craggy knolls, within less than a hundred yards of each other. Below, at the water's edge, are the church and convent of Bornhofen. Proceeding onwards, the banks become more and more rocky and wild in their character, the river having, in some places, the appearance of ploughing its way through a ravine, whose shelving sides are too steep to afford footing for the vine-dresser, and are shagged only with natural tufts of bushes and trees. Through this wild tract, the Rhine describes a number of short turns, and at each seems to enter a completely land-locked sheet of water, silent as a Highland lake, and occasionally diversified with a small shrubby islet, set as a gem on its glittering bosom.

Proceeding upwards through this wildest part of the river scenery, we have our attention successively called to the castles of Thurnberg and Katzenelenbogen, both in ruins, on rocky knolls on the right bank, and opposite them, on a high cliff on the left, the massive ruined fortress of Rheinfels. This castle, which is the largest on the Rhine, was originally built by the Count of Katzenelenbogen, in 1245, principally for the purpose of enforcing tribute on the passage of vessels on the river. Ten years after its erection, the confederation of free Rhenish towns, enraged at the exactions of the count, marched an army against the castle, and besieged it for fourteen months. They were not successful in their efforts, but the spirit they manifested spread over the country, and led to a general crusade against this and every other robber castle on the Rhine; so that about the end of the thirteenth century, almost every castle, from Mayence to Cologne, was taken and destroyed. Hence, a main cause for such a lengthened series of ruined fortlets. Rheinfels was afterwards enlarged and modernised by the Landgrave of Hesse, but was finally given up to the French in 1794, when it was blown up, set on fire, and completely destroyed. The marks of the conflagration are now visible on its blackened walls and ruined windows. The remains of the fortress, with its gardens, lawn, and vineyards, were purchased for 500 francs, by an individual who has built an inn adjacent, and shows the ruined dungeons and outworks to strangers.

At the base of the cliffy bank of Rheinfels, stands the poor old town of St Goar; and opposite it, on the other side of the river, the towns of St Goarshausen, and village of Neubrückhausen. Immediately beyond St Goar, we come to one of the narrowest parts of the river, overhung with almost perpendicular cliffs, and known by the name of the Lurrie; here, in order to bring out the echoes for which the spot is celebrated, a musket is usually fired, as the steamer passes, by a man placed on the road under the cliff. The river, in passing the strait, is more impetuous and turbulent than is usual in its course, and the spot has received the name of Lurrie, or water spirit, from a wild legendary tale, which describes the dangerous pass as being haunted by a fair female spirit who lures the poor navigator of the Rhine to destruction. There has been no instance, I believe, of her having made any attempt to mislead steam-vessels, or having been seen by any of their passengers. Another legend of the Rhine affixes the name of the Seven Sisters to as many rocks, which at certain seasons, when the stream is low, show their heads above the surface of the water. These, we are told, were seven daughters of the lord of Schomberg, whose castle is adjacent at Oberwesel, and were, for some haughtiness of demeanour towards a prince of the fairies in disguise, transformed into rocks while bathing. Passing, then, these seven unfortunate young ladies, we are speedily at Oberwesel (left bank), a town of two or three thousand inhabitants, and distinguished at a distance by its handsome Gothic church, and the ruins of the

castle of Schoenberg or Schomberg, which looks down from a rocky hillock beyond.

A new reach in the river exposes the small old town of Caub on the right bank, and above it, on a steep rock, the ruins of the castle of Gutenfels. Nearly below Gutenfels, and on a rock in the middle of the Rhine, stands the ancient castle of Pfalz, composed of a central tower and lower buildings around it, the whole walled in, and only approachable by a temporary wooden stair let down to the verge of the rock. Pfalz belongs to Nassau, and served at one time as a toll-house for the river, and as a state prison. To an apartment in this isolated fortlet, also resorted for protection, during the turbulences of the middle ages, the countesses of the palatinate on occasions of their *accouchements*—a fact conveying an impressive testimony of the horrid insecurity of life and person in the age of chivalry and romance. Next, on rounding a bend of the stream, we have before us, on the left bank, the old town of Bacharach, which is said to derive its name from a rock situated in the middle of the river, called by the Romans *Ara Bacchi*, the Altar of Bacchus. The rock is believed to have received this odd appellation, from an idea that when it was prominently visible above the water in summer, there would be a good vintage—in other words, when the summer is dry and warm, the grapes ripen to the greatest perfection, a truth which it would be quite needless to dispute. In passing Bacharach, and casting a glance up the ascending braes above the town, we perceive the shattered ruin of the church of St Werner, consisting of a few vacant Gothic arches, of light and elegant construction. The story of St Werner is too extraordinary to pass unnoticed. He was a pious youth, who lived some eight or nine hundred years ago at Oberwesel, where he was barbarously murdered, though by whom, is not clearly stated. The body having been thrown into the Rhine, instead of floating downwards with the current, as all common bodies it may be supposed would have readily done, was carried upwards against the current, and went ashore at Bacharach, from which it would not budge an inch till taken up and buried in a particular spot above the town, as the body of a canonised saint. This ceremony was speedily performed by the amazed and overawed inhabitants; and to mark their sense of the distinguished honour shown to their town by the murdered body, they erected a church over its tomb. The number of miracles which were wrought in after ages at the shrine of St Werner, are said to have been very considerable.

A short way beyond Bacharach, but on the right bank of the river, we pass the town of Lorch, and the ruins of the castle of Nollingen above it. On the opposite side are seen successively the ruined castles of Furstenthal, Heimburg, Sonneck, and Falkenburg, also the castle of Vautsburg or New Rheinstein. This latter fortlet, which has been restored by the royal family of Prussia, stands on a jagged rock half way up the cliffy bank rising from the margin of the river, and is mentioned as well worthy of a visit by strangers, on account of the style of its architecture, and the ancient armour, carving, embroidery, painted windows, ancient vessels, and other things it contains, all in perfect keeping with the feudal character of the structure.

We now approach a part of the river where the current is so rapid that the steam-vessel is unable to compete with it unassisted, and accordingly, a number of horses standing ready on the right bank are attached by ropes, and aid in bringing the steamer into the placid water at the head of the rapid. In proceeding upwards, about this place, we pass on the right bank, the small town of Asmaushausen, and beyond it, most extensive vineyards, to which it gives its name. The vineyards of Asmaushausen are among the most curious things one sees on the Rhine. Steep hills ascend from almost the edge of the river to a height of about eight hundred feet, and are, over the whole surface, disposed in the usual form of terraces to the very summit. On one of the highest we reckoned twenty-one or twenty-two terraces, resembling the steps in a pyramid, each step being shorter and smaller than that below it, till at the top the terraces were on the most diminutive scale. The sight of this hill, covered with beautiful light green vine plants in full leaf, is one of the most pleasant we behold in the whole course of the journey up the river, for besides the actual beauty of the verdant scene, it testifies to the patient industry of the people, most of whom depend for their subsistence on the precarious harvest of the vines.

On issuing from the pass and rapid at Asmaushausen, and making a bend round the rocky promontory, on which stand the ruins of the castle of Ehrenfels, the steamer may be said to have left the wild and romantic tract of the river, which began at Boppard, and now enters a scene of an entirely different character. The Rhine expands to a greater breadth, the hills retire and slope backwards on each side with easy ascent, and at a short distance farther up, are succeeded by rich level fields and partial elevations. Just at the entrance to this charming district, and on the left bank, is situated the town of Bingen, on an angle of land formed by the junction of the Nahe and the Rhine. The Nahe here forms the boundary betwixt the Prussian dominions and the principality of Hesse, the latter stretching up the left side of the Rhine towards Mayence. On a rock in the Rhine nearly opposite the embouchure of the Nahe, stands

the castle of Maüsethurm, or mouse tower, regarding which, animity and superstition have preserved a tale, that has been turned into verse by Mr Southey, detailing the cruelties of a Bishop Hatto of Mayence, who, while concealing himself in this his tower of strength, was devoured by an army of rats. Unfortunately for the credibility of the story, the tower was not built till two centuries after the death of Bishop Hatto, who, also, instead of being a man of a merciless disposition, was a person of princely munificence, and conferred an important boon on the district, by clearing away the rocks in the river at this spot, and rendering the stream navigable.

Bingen is an admirable starting point for those who wish to explore on foot the beauties of the country on both banks of the river, including the scenery of the Nahe. The soft and beautiful stretch of country commencing on the Rhine at Bingen, is locally styled the Rhinegau, or Rhine country, and within this fertile tract the finest wines are produced. The richest wine district is on the north-east, or right bank of the river, from which the low hills wave far into the distance, and expose to the southern sun an universal garden of vines. First, we have Asmaushausen, then Rudesheim, Johannisberg, and fifty other localities, one after the other, all celebrated for the superior quality of their wines, and lying within the compass of two or three miles on these rich sloping banks. In the midst of this terrestrial paradise—for, dressed in the garb of summer, with the broad Rhine in front, dotted with fertile islands, and sheltered by the hills of the Taunus, it really deserves such an appellation—stands Biberich, the princely residence of the duke of Nassau, and town of the same name adjacent. The palace, which occupies a conspicuous situation near the Rhine, is a large and handsome edifice, built in the old French style. The gardens behind are said to be very beautiful. When at Biberich, we have almost reached Mayence, for, after passing it, and issuing from behind a woody islet in the river, the towers of that ancient city are before us, rising, like those of Coblenz, from the margin of the left bank of the Rhine.

Here let us pause. We have been carried through a tract of not less than fifty miles, forming one of the fairest and most romantic portions of Nature's domains, and unequalled in any part of the world for its great extent, as well as the lavish abundance of its objects of picturesque beauty. Nowhere, certainly, in the whole hundred miles from Cologne upwards, does the scenery possess those qualities of sublimity, and grandeur which we find in such savage regions as Glencroe—the generally limited height of the mountain steeply necessarily precluding any character of that kind—but, taken all in all, for the vast number of exquisite points of beauty, and as combining every thing which constitutes the truly picturesque in nature, with the romance in art, the scenery, it must ever be allowed, is altogether inapproachable.

TRANSPORTATION—AS A PUNISHMENT.

A SELECT COMMITTEE of the House of Commons was appointed, in November 1837, to inquire into the "System of Transportation, its efficacy as a punishment, its influence on the moral state of society in the Penal Colonies, and how far it is susceptible of improvement." The Report drawn up by this committee at the close of their sittings, as well as the evidence brought before them, now lie before us, and present many interesting facts relative to the form of punishment which constituted the subject of inquiry. These facts, and the views and conclusions founded upon them, corroborate, in a remarkable manner, the opinions recently stated in this periodical by Miss Harriet Martineau.

The Parliamentary Committee have arranged the result of their labours under the following heads:—First, as to the history, nature, and amount of the punishment of transportation. Second, as to the apprehension produced by the threat of transportation, and its tendency to prevent crime in the mother-country. Third, as to the effects of transportation on the character of those who have undergone that punishment. Fourth, as to its influence on the moral state of society in the penal colonies. Fifth, as to its economical effects on those communities, and to what extent their pecuniary interests would be affected by its continuance or discontinuance. Sixth, as to the cost of the system of transportation. And, lastly, as to whether it be susceptible of improvement; and if not, what substitute might be adopted with advantage. These heads, it is obvious, have reference to almost every point of interest connected with this subject. We propose to follow the Report through each successive division of the inquiry, though, of necessity, in a brief and general manner.

New South Wales, Van Dieman's Land (both, it is well known, Australian colonies), Norfolk Island (a small island lying about a thousand miles to the east of Australia), and the Bermudas (a group in the Atlantic, opposite to the coast of Carolina), are the penal settlements, at this day, of Great Britain. New South

Wales has received, on an average, for the last five years, 3544 convicts annually, and in 1836 the whole convict population of the colony amounted to 25,254 men, and 2577 women; in all 27,831. The average number of convicts sent to Van Dieman's, and during the last five years, is 2078, and the convict population there amounted, in 1835, to 16,968 persons, of whom 2054 were women. Norfolk Island contained, in 1837, above 1200 convicts, most of whom had been re-transported from New South Wales, for offences committed there; and Bermuda holds about 900 convicted persons. These statements show how large is the number of human beings affected by the punishment of transportation. That punishment is proved, by the evidence in the Report, to be at once extremely unequal and severe. In New South Wales and Van Dieman's Land, to which colonies the following remarks chiefly apply, the greater number of the convicts are distributed among the free settlers as assigned servants; the remainder are mostly retained in the employment of government. In some cases, the condition of assigned convicts is comfortable enough, but this is most uncertain, as it depends entirely on the temper and disposition of the masters to whom chance hands them over. The assigned convict is at the mercy of the most summary laws; the lash, imprisonment, solitary confinement, and labour in irons, are the penalties to which, on the responsibility and at the option of individual magistrates, he may be subjected. That these laws are not inoperative, is proved by the fact that, in Van Dieman's Land, in one recent year, the number of lashes inflicted was about 50,000, and the summary convictions 15,000, though 15,000 was the whole amount of the convicts then in the island. In New South Wales, the number of summary convictions, in 1835, was 22,000, and the lashings frightful in amount. It is to be observed, that we do not here advert to the deservings of the convicts. All of these punishments may have been merited, but our purpose at present is merely to prove the actual severity and painfulness of the state of transportation to the assigned convict population. One excellent authority describes the practice of assignment as "cruel, uncertain, prodigal, and ineffectual, either for reform or example." Not less painful to the parties subjected to it, according to the evidence, is the system of employment under government. Most of the convicts thus distributed work in parties at the roads, and, for the most part, in irons. Their condition is wretched in the extreme.

But, while the pains of transportation are, in reality, thus severe, the effect of such severity, in rendering the threat of transportation a matter of fear to criminals and criminally disposed persons in the mother-country, is entirely lost. The punishment is underrated and laughed at, chiefly in consequence of the exaggerated reports which have got abroad respecting the comforts, wealth, and success in life, which have fallen to the lot of various felons in the colonies. These cases are remembered, while the general mass of convict suffering is forgotten or unheard of. For this and other reasons, the punishment of transportation, as now conducted, becomes almost entirely valueless, as regards its tendency to prevent the commission or crime in the parent land. Abundance of evidence is given in the Report in proof of the ineffectiveness of this conclusion, but it is sufficient for our purpose here to state that such is the fact.

The third head of the committee's investigation regarded the effects of transportation on those who had undergone the punishment. The amount of crime perpetrated in the penal colonies is partly shown by the summary punishments inflicted annually, but the number of convictions for crimes punishable with death has to be added to the sum. The number of executions in New South Wales is so great, that, supposing the state of crime and punishment in England to be on an equal scale, the latter country would display 7000 executions in one year! The crimes in the penal colonies are, indeed, almost innumerable; yet, of the whole recorded amount, according to the late Attorney-General of Van Dieman's Land, not less than three-fourths are committed by offenders whose sentences of transportation have expired! Can any thing more completely prove the total inefficiency of transportation in amending the character of those who undergo it? Again, as to the effects of the present transportation system on the moral state of society in the colonies, the evidence in the Report presents a most frightful picture. Convict servants, male and female, have been known directly to introduce contamination and misery into numberless families, and their less indirect influence is still more corrupting, and subversive of all the better sentiments. The progressive demoralisation of the penal colonies, both as regards the bond and free inhabitants, is but too clearly established by the single statistical fact, that crime has increased in a greater ratio than the population, and, consequently, in a far greater ratio than the number of convicts. "If the existing system be continued," say the committee, in closing their remarks on this head, "the moral condition, it is to be feared, of these colonies, is more likely to be still further deteriorated than improved."

As concerns the pecuniary interests of the penal colonies, and the cost of maintaining the present transportation system, it is unnecessary to say much. The discontinuance of that system would cause an obvious dearth of labourers, but the same cause would send out free labourers in greatly increased quantities; for, undoubtedly, the employment of convicts has had a tendency to bring labour into disrepute with the

classes who would otherwise have emigrated with that view. Such are the numbers of working people at present emigrating to Australia, indeed, that there appears every prospect of a full supply of free labour, ere any great length of time elapses, in that quarter of the world. The expense to the country of the transportation system has all along been very considerable, averaging, since its commencement, £156,398 a-year. But, at present, it is more than treble that amount, and is rapidly increasing every year. In 1836-7, the sum expended on the military establishments, convicts, &c., was £488,013, excluding from the calculation the expenses of Bermuda.

Having considered all these points at some length, the committee consider themselves entitled to infer from the whole, "that the two main characteristics of transportation, as a punishment, are inefficiency in deterring from crime, and remarkable efficiency not in reforming but in still further corrupting those who undergo its penalties; that these qualities are inherent in the system, which therefore is not susceptible of any satisfactory improvement; and, lastly, that there belongs to the system, extrinsically from its strange character as a punishment, the yet more curious and monstrous evil of calling into existence, and continually extending, societies, or the germs of nations most thoroughly depraved, as respects both the character and degree of their vicious propensities. Your committee, therefore, are of opinion that the present system of transportation should be ABOLISHED." Having stated this conclusion, the Report then proceeds shortly to consider the proper kind of punishment to be substituted for the other. Every individual witness, out of the many competent and well-informed ones examined by the committee, declared the free intercourse of the convicts with one another to be the main cause of the spread of crime and immorality. Even the mere collision on the voyage had been repeatedly known to convert a man who had committed a single offence in the moment of temptation, to a hardened, reckless reprobate. Keeping these evils in view, the committee observe, that "the experience of all nations, and more particularly the inquiries which have been instituted of late years, appear to establish the conclusion that some modification of the penitentiary system is best calculated to inspire terror, and to improve the moral character of an offender; and as far as any inference can be drawn from a comparatively short experience, it appears that these two main objects of punishment are most likely to be obtained by that form of the penitentiary system which is known as the separate system of America."

The separate system, as detailed in previous numbers of the present periodical,* consists in the incarceration of delinquents in separate cells, no one criminal having any access to or sight of another criminal during the whole period of confinement, but is well provided with work, and receives the visits of secular and religious teachers, and other functionaries connected with the prison. The beneficial influence of this mode of punishment—a mode which reclaims instead of vitiating offenders—is incalculable, and must in time supersede the worse than useless practices now pursued with reference either to the galleys or to transportation. The main objection to the substitution of the separate system for transportation is, it seems, the very great expense which would attend the building of the necessary prisons. But surely the people of this mighty empire, who have recently given twenty millions to ensure the freedom of the unfortunate Africans, would never hesitate to devote their means to the liberation of so large a body of their fellow-countrymen—erring though they may be—from the bonds of vice, crime, and misery, if once fully assured that such a result was practicable. The site of such prisons or penitentiaries is a matter for further consideration. The Parliamentary committee recommend that the shorter sentences should be undergone at home, and the longer ones abroad, in some place fixed on for the purpose. The advantage of having the principal penitentiaries abroad is obvious. The chances of communication between the prisoners and their friends would be lessened; the distance would render the punishment a greater object of dread; and the opportunities of turning the convict labour to the defrayal of the establishment's expenses, would be much greater. On the other hand, if the prisons were at home, the expenses (of removal, &c.) would be materially diminished, and the eye of the government would be more directly upon them. A mixed system, partly domestic and partly colonial, would probably suit all purposes best. Norfolk Island seems to the committee to be a place well suited for the purposes of a distant penitentiary of this kind, having a healthy climate, a small population, and other advantages for securing the comfort as well as the seclusion of the convicts.

In conclusion, it may be noticed that the committee strongly advise, in case of an alteration in the transportation system, that the new scheme should have some provision for the removal of reformed criminals to new scenes, where their past history may not be known, and where their good conduct may win them a fair and respectable place in society. This seems to them, and certainly is, a most important consideration. Altogether, comparing the probable issue of these suggested improvements in our penal legislation, with the actual consequences of the system as it stands, few will be inclined to say that it would be wise or

proper, on mere pecuniary considerations, to refrain from a trial of the change. The recorded results of the present system present so strong a contrast to the ameliorations in morals and disposition described as attendant on the separating penitentiaries, that every one, it seems to us, must be convinced, both of the necessity for amendment, and of the peculiarly appropriate and suitable nature of the change proposed.

THE TURF.

SOME ten or fifteen years ago—certainly twenty years ago—prize-boxing matches were quite common in England, and, we should suppose, were relished by a large class of the community, for a leading periodical used to entertain its readers with articles, almost monthly, on Boxers and Boxing. Boxing-matches are now of so rare occurrence, that they can hardly be said to exist—the practice of men beating each other to death, for the amusement of hundreds of spectators, is no longer tolerated. Social improvement proceeds only by slow degrees: the people have lost boxing, but they still retain the Turf, or horse-racing, which answers pretty well as a means of moral debasement, and is yet any thing but out of fashion, as the following passages from Mr Grant's "Travels in Town" will help to show.* The author begins with a glance at Epsom races.

"Until twelve o'clock, crowds continue to arrive on the race-course, not only from London, but from all parts of the country within a circuit of twenty or thirty miles. What an immense concourse of human beings! There cannot be less than 250,000 persons there. And see how well dressed the vast majority of them are! Ragged coats or faded silks are but rarely witnessed. Whatever may be the condition of the pocket or the belly, there is no cause of complaint, with very few exceptions, on the score of the back. If there be a lack of money or of food, there is no lack of raiment. And how elegantly dressed are a very large proportion of the immense assemblage! The women are gorgeously so. You would find it a task of some difficulty to point out a score of ill-dressed females within a moderate distance of the place at which you stand. Witness the forest of waving plumes of feathers. You wonder where they all came from; you had no idea before, that London could have furnished such a supply. How brilliant the aspect which the vast numbers of ladies who are present give to the immense assemblage! Their attire is elegance and splendour combined—their persons are handsome—and the charm caused by such a display of beauty and fashion would be complete, but for the unpleasant fact obtruding on your mind, that a very considerable portion of them are of exceptionable character. But let that pass. The face of the adjoining hill, extensive as is the space it embraces, appears as if instinct with life. Persons of all ranks and classes are there crowded together as densely as it is possible for them to be. See also both sides of the race-course, fully a mile and a half in length. Carriages, coaches, phaetons, cabs, carts; vehicles of all sorts, in short, are there ranged as closely as they can be, three or four deep, from nearly one extremity of the course to the other. And so thickly tenanted are they, chiefly with elegantly attired ladies, that it is with difficulty the parties can find standing room. Those large tents you see here and there, and every where, are so many portable gambling places, in which the work of plunder is going on at a fearful rate. Thousands are on the eve of ruin by the result of the impending race; the ruin of the foolish persons who are throwing the dice there, is already proceeding at a most rapid pace.

The horses about to start appear on the field, and the work of betting, as people see them with their own eyes, begins afresh. In a few minutes more, the bell rings to summon the animals to the starting point and the starting position. That moment there is a rush on the part of the tens of thousands who were occupied in amusing themselves in various ways outside, towards the dense masses of men, women, horses, vehicles, &c., which line the margins of the course. A few minutes elapse between the ringing of the bell and the issue of the race being declared. And what an important fraction of time is that to thousands who are present! Their prosperity or ruin—their future happiness or misery in this world—their affluence or beggary—the weal or the wretchedness of their wives and children, are all wrapt up in the events of five or six minutes. The signal is given for starting. 'Go!' shouts a loud voice at the starting post. The horses are all off. Now commences the frightful tempest of conflicting feelings in the breasts of multitudes before you. The horse which a party has backed against the field, starts fair; he is ahead. Imagine, he who can, the hope and joy mingled with fear which agitate such a person's bosom. The animal is distanced by some fleetest steed; the demon of despair seizes the party in a moment, in his iron grasp. He is a ruined man; his wife and family are in one moment hurled from the heights of affluence, to the lowest depths of poverty. He can scarcely support himself; he would fall prostrate on the ground, but that he is kept up by the pressure of the crowd. Had he the means and the opportunity, the probability

is that he would, in the agony of his remorse and despair, that moment destroy himself. This is no imaginary picture—no exaggerated description of the tempest which rages in a man's bosom, when he has been infatuated enough to stake his all on the result of a horse-race, and that result has been adverse. It is only a few years since a case was brought before the public, which fully equalled the one I have here supposed.

The concluding race takes place. It is over! and there is a universal rush towards the road leading in the direction of home. Such a scene of bustle and confusion as is now presented! Vehicles come in collision, and, what is worse, pedestrians are often jammed between two or more of these vehicles. The sufferers shriek, the ladies scream, and the drivers of the vehicles swear at, and abuse, and blame each other. Horses become restive; legs are broken, and bones are fractured. Great injury is done to the limbs of her majesty's subjects: it is fortunate if no lives be lost. The more tender-hearted of the myriads present feel for those who have already suffered, and are filled with fear and trembling lest other and still greater disasters should yet occur. Eventually the ground appears less densely peopled; the immense concourse assembled are now rapidly undergoing the process of dispersion. The majority of the tenants of the vehicles, and of the equestrians and pedestrians, have now forced their way to the road, and are earnestly bound in a homeward direction. Did you ever see such a road! Did you ever witness such extensive lines—all as close as they can be, so as to be able to move—of carriages, cabriolets, carts, horses, and human beings! Never, I will answer for it. You fear there must yet be many accidents before they all get home. Your fears are but too well founded; for I believe there has never yet been a Derby day in which there have not been a greater or less number of accidents, many of them serious: it is well if none prove fatal.

The amount of money which changes hands immediately after the conclusion of the leading races, is immensely great. I have heard it stated by one of the leading sportsmen of the present day, that at least £1,000,000 changes hands by the result of the Derby race at Epsom. Surely there must be an exaggeration here. If there were only half that sum, which I am convinced there is, it would be a very large amount. In some cases particular individuals bet to the extent of £20,000, £30,000, and even £40,000, on a single event. In 1826, Lord K—, one of the most celebrated Turfites of the present day, bet £30,000 to £1000 against a horse called Crusader. In the same year, another sporting character bet £20,000 against General, which was the favourite horse, and won it, but it was commonly believed there was foul play. Mr R—, the distinguished Yorkshire sportsman, won at the Derby race of 1832, the sum of £40,000 by backing St Giles, which was his own horse, exclusive of £2775 in stakes. This was certainly good work for one day.

Horses of great reputation on the turf always bring large sums. From £2500 to £3500 is quite a common price for a first-rate horse. As high as 5000 and even 6000 guineas, has repeatedly been given. One of the well-known proprietors of a great gambling house in Bennet Street, gave 5000 guineas for Ludlow at the Doncaster races of 1832. Some years ago, the Duke of Cleveland gave £12,000 for four horses.

So great is the supposed inequality of the horses that are entered to contest the leading prizes, that it is quite common to bet fifty or sixty to one, against a particular horse. In several cases one hundred to one have been bet that a certain horse would not win. The greatest disproportion I have heard of in the betting on any horse, was in the case of one which ran for the Derby some years ago, when two hundred to one was bet against him.

While some horses never gain more than one prize, others have a continued course of good luck. The mare Fleur de Lis won no fewer than ten out of eleven races. But the horse, which, of all others, continued to run for the longest time, and which gained the greatest number of prizes, was Dr Syntax. This horse continued on the turf ten consecutive years, and ran in the course of that period no fewer than forty-nine times. Out of this number of contests, Dr Syntax won the prize in twenty-six instances. Among the prizes thus gained were twenty gold cups.

All disputes which arise about matters directly appertaining to the turf, must be referred to the decision of the stewards of the Jockey Club. This is the only recognised tribunal in such matters. Its decision is final: there is no appeal from it. The Jockey Club consists of upwards of sixty noblemen and gentlemen of more or less standing in the sporting world. The stewards are three in number. One retires every year to make way for another, the retiring steward having the right to name his successor.

The turf is on the decline. Every friend of morality, and every one who wishes well to his fellow-creatures, will rejoice at this. What are now the leading horse-races, but gambling transactions on an extensive scale! There is a numerous gang of sharpers and black-legs, who make the plunder of simpletons who bet on horse-racing a part of their daily schemes and daily roguery. Their plans are secret, but they are deeply laid, and are carried out with a skill and artfulness which render their success almost a matter of moral certainty. And even where they are detected, it is not, unhappily, until they have fleeced their victims. What villainies have

* Travels in Town, by the author of "Random Recollections of the House of Commons." 2 vols. London, Saunders and Otley.

of late been brought to light, which have been practised at our leading horse-races! But in no instance have they been discovered in sufficient time to save the unsuspecting simpletons whose money was at stake. And what care the unprincipled 'legs' for exposure, when it comes not until after they have pocketed the money of their victims! Nothing at all; for they have no character to lose. And they know the law cannot reach them. Who does not remember the disgraceful transactions which took place at the Doncaster races of 1832! And are not certain transactions of the most unprincipled kind, which occurred at a celebrated race a few months ago, and by which thousands have been ruined, still the subject of animated and indignant remark in all the sporting circles! The affair of the horse Ludlow is still fresh in the recollection of all patrons of the turf; and that of Harkaway, at a very recent race, is not likely to cease to be spoken about for some time to come. Is it not beyond all question, that horses, which otherwise would have won, are often prevented from winning by the most consummate roguery! In some cases they are drugged so as to make them sick; in others, the jockeys are bribed to ride them in such a way as to prevent their coming in first. A very common expedient resorted to by the 'leg' fraternity, when they have made the arrangements to their entire satisfaction beforehand, is to withdraw the horse which was the greatest favourite, by either purchasing him from the proprietor, or pretending to have purchased him. In fact, there is no end to the tricks of the turf. The ramifications of the roguery practised by the mendacious gamblers who are so largely mixed up with all turf transactions, are so varied and extensive, that no calculation or foresight can guard against their effects. So cunningly and skillfully are their schemes for plundering her majesty's subjects laid, that they often, with the view of gulling the public, bet to a certain extent in favour of the favourite horse, though they know he will lose. A little loss in this way is amply made up by secretly betting to a large amount the other way; or by some other private arrangement made among themselves. Another favourite expedient on the race-course is to invent all sorts of rumours respecting different horses—rumours relative to the probability, or otherwise, of particular animals running; and thus raising the odds, or causing them to fall in particular cases, according as their own interests are affected. Scarcely less notorious for the invention of false rumours on the part of a gang of black-legs, is the race-course, than is the Stock Exchange itself. With regard, again, to the running of favourite horses, it is now so common a practice for the parties interested to manage matters in such a way as that they shall not win—that it has of late become customary with the recently initiated, before betting for or against any favourite horse, to do every thing he can to ascertain whether or not it really be meant or intended by the proprietor that the horse shall win.

The public, who know little or nothing of the tricks of the turf, never contemplate the possibility of any person entering a favourite horse, far less of his starting him for the race, without being most desirous that he should win, and, consequently, are victimised without, perhaps, ever suspecting that there was aught else than perfect fairness in the matter. It is well known that many hundreds of pounds have been given to proprietors of favourite horses, to bribe them not to win the race; and it is equally well known that the jockeys destined to ride such horses, have, when not directly bribed by the 'legs' to lose the race, often received through the proprietors two or three hundred pounds for riding in such a way as to cause the horse to make a respectable appearance on the race-course, and thus lull suspicion of any treachery without winning the prize.

The trickery which is practised on the turf may be inferred from the character of the persons who most largely patronise it. Who are these! Notoriously the leading proprietors of gambling-houses in London, and the principal frequenters of those houses. As to gambling noblemen and gentlemen: why, there is not one of any notoriety in our London hells, that is not equally well known on the turf. I could here run over in dozens the names of dukes, of marquises, of earls, and of noblemen and gentlemen of every rank, professed devotees of gambling at the hazard-tables of the hells in town, who are equally notorious for their patronage of the turf. And how many of these are there, who are bankrupt in fortune as well as in character!

Then there are the false notions of honour that prevail on the turf. Such are these notions, that Turfites feel bound to pay, provided they can at all raise the amount, any losses they may incur by betting, even though their tradesmen and families should not only be suffering the greatest privations in consequence of the non-payment of the amount due to them, but should be brought to the verge of ruin on that account. How many poor tradesmen suffered, and how many of themselves or their successors still suffer, from the non-payment by the late Duke of York, of the debts he contracted with them! And yet he always made a point of paying the losses he sustained on the turf. It was the same in the case of his brother, George IV., when Prince of Wales; and it is the same with numbers of noblemen whose names might be mentioned. Such is the morality which obtains on the turf. Such are the notions of honour that are entertained by its votaries.

The turf, then, is a most prolific source of social evil. I am convinced it would be impossible to estimate the

amount of mischief it has done to morals, to families, and to society. It first destroys all the better feelings of one's nature, and then destroys one's fortune. Could all those that are still alive, who have been ruined by the turf, be brought into one place, what a vast and wretched assemblage of human beings would they present!"

AUGUSTUS BROOM,

A SONG.

TUNE—"On a Bank of Flowers."

In a parlour gay, one summer day,
With heat and port opprest,
Augustus Broom, a young bridegroom,
Lay down to take some rest;
When Agnes sweet, his darling bride,
Came in and sat down by his side,
And said, "My dear, your Nancy's here;"
He with a snore replied.
"What, asleep!" said she, "and as yet but three
Weeks since we two were wed;
I thought of a walk, or at least some talk;
Is all your fondness fled?
Do give me some attention, pray,
And let not Nancy have to say,
'That when she has dressed, and done her best,
Her pains are thrown away.
Nay, since you will be snoring still,
I know what I shall do;
Those whiskers fair, beyond compare,
I'll clip a curl or two.
I know you love them passing well,
And would not one for a kingdom sell.
But 'twill serve you right for this shameful slight,
And be a joke to tell."
The deed was done, and she thought 'twas fun,
For hair can grow again;
But when Broom did feel the cold hard steel,
He started up amain.
"My dear," he cried, with a frantic roar,
And quickly off both whiskers tore.
"It is too bad—you would make one mad—
They cost me two pound four!"
February 2, 1838.

ANECDOTE OF LADY —, AUTHORESS OF "AULD ROBIN GRAY."

[By N. P. Willis.]

ONE of the most elegant and agreeable persons I ever saw was Miss Porter, and I think her conversation more delightful to remember than any person's I ever knew. She is still what I would call a handsome woman, or, if that be not allowed, she is the wreck of more than a common allotment of beauty, and looks it. I have passed many months under the same roof with Miss Porter, and nothing gave me more pleasure than to find the company in that hospitable house dwindled to a "fit audience though few," and gathered around the figure in deep mourning which occupied the warmest corner of the sofa. In any vein, and apropos to the gravest and the gayest subject, her well-stored mind and memory flowed forth in the same rich current of mingled story and reflection, and I never saw an impatient listener beside her. I recollect, one evening, a lady's singing "Auld Robin Gray," and some one remarking (rather un sentimentally), at the close, "By the bye, what is Lady — (the authoress of the ballad) doing with so many carpenters? Berkeley Square is quite deafened with their hammering!" "Apropos of carpenters and Lady —," said Miss Porter, "this same charming ballad-writer owes something to the craft. She was better born than provided with the gifts of fortune, and in her younger days was once on a visit to a noble house, when to her dismay a large and fashionable company arrived, who brought with them a mania for private theatricals. Her wardrobe was very slender, barely sufficient for the ordinary events of a week-day, and her purse contained one solitary shilling. To leave the house was out of the question; to feign illness as much so; and to decline taking a part was impossible, for her talent and sprightliness were the hope of the theatre. A part was cast for her, and, in despair, she excused herself from the gay party bound to the country-town to make purchases of silk and satin, and shut herself up, a prey to mortified low spirits. The character required a smart village dress, and it certainly did not seem that it could come out of a shilling. She sat at her window, biting her lips, and turning over in her mind whether she could borrow of some one, when her attention was attracted to a carpenter, who was employed in the construction of a stage in the large hall, and who, in the court below, was turning off from his plane, broad and long shavings of a peculiarly striped wood. It struck her that it was like ribbon. The next moment she was below, and begged of the man to give her half a dozen lengths as smooth as he could shave them. He performed his task well, and, depositing them in her apartment, she set off alone on horseback to the village, and with her single shilling succeeded in purchasing a chip hat, of the coarsest fabric. She carried it home, exultingly, trimmed it with her pine shavings, and on the evening of performance, appeared with a white dress, and hat, and belt ribbons, which were the envy of the audience. The success of her invention gave her spirits and assurance, and she played to admiration. The sequel will justify my first remark. She made a conquest on that night of one of her titled auditors, whom she afterwards married. You will allow that Lady — may afford to be tolerant of carpenters!"—*Pencilings by the Way, in New York Mirror, Dec. 30, 1837.*

CHAMBERS'S EDINBURGH JOURNAL.

WE have now completed SEVEN volumes of the Journal: the present number forms the commencement of the EIGHTH. This, in itself, is a commonplace circumstance, and would be undeserving of any notice, if it did not afford us a convenient opportunity of thanking our numerous friends and readers for their continued support of our humble miscellany. Those who wish well to CHAMBERS'S EDINBURGH JOURNAL, will be glad to be informed that the circulation of the work continues on the same unabated scale of advancement as formerly, and at this moment is higher than at any previous period of its history. During the past year, we have printed 3,552,000 sheets, which, divided by 52, gives an average weekly impression of 68,300 numbers. We are not vain enough to suppose that this extent of support to our work has reference to any peculiar capabilities of our own, but is assignable to the taste which now largely prevails for healthful moral instruction and matter of innocent and rational entertainment. It would appear from the success of our periodical, that even in the midst of great social jars, there is in this country a widely spread disposition to rely on the simple and soothing charms of literature for daily thought and amusement. The period at which our work began (February 1832) was apparently most inauspicious for any undertaking of the kind; yet, on the first day of publication, 20,000 copies were sold in Scotland alone; and notwithstanding the agitations in society during the last seven years, the circulation of the work has never at any time declined a single copy; it has, on the contrary, steadily advanced to its present point. Viewed only as a fact in literary history, we think such a circumstance not unworthy of notice, for it helps to throw light on the constitution and feelings of society, and in some measure proves that the people at large, to whom our paper appeals, are desirous of cultivating the arts and pleasures of peace. One great leading principle has guided us, as a pilot through the storms which warred and continue to war around us, and to that we shall steadfastly adhere, so long as we shall be enabled to edit these sheets; that principle is the avoidance of all points calculated to awaken the more bitter class of controversial feelings. WE ADDRESS OURSELVES TO MANKIND AT LARGE—not to a party or a class. We recognise in our readers and supporters only human beings, and care not what country or clime they are of, or what station in society they occupy: it gives us as much sincere gratification to learn that our sheets are read in America, Australia, and India, as to know that they are sought for on the banks of the Tweed or the Thames. Acting from considerations of this nature, and throwing ourselves on the world at large for support, we, of course, seek no special patronage or favour, and without in the smallest degree disparaging the efforts of others, hope only to be permitted to follow out our own comprehensive scheme for the moral and intellectual improvement of our fellow-creatures.

Without relaxing our endeavours to furnish original papers of an interesting kind for the pages of the Journal, it may be mentioned, that we continue to devote a portion of our time to the preparation of the series of works for use in schools and in the private instruction of youth, entitled CHAMBERS'S EDUCATIONAL COURSE; also to the series of publications issued under the general title of PEOPLE'S EDITIONS. Both of these series, we are happy to say, have met with a success only inferior to that of the Journal, notwithstanding that the last mentioned has been imitated in different parts of the country. There are now issued sixteen volumes of the EDUCATIONAL COURSE, several of which have been published during the past year, and of the PEOPLE'S EDITIONS seventeen distinct works; others are in a state of preparation. It is an important feature of the PEOPLE'S EDITIONS, that where necessary for their improvement, considerable editorial care is exerted, so that the editions are in many cases superior to those which have hitherto appeared. This peculiar feature of the works—never, perhaps, before attempted to be given to this class of cheap publications—places them, it is humbly represented, on a footing very different from that of mere reprints. Of those now published, Paley's Natural Theology, Franklin's Life, Park's Life and Travels, and the Works of Robert Burns, furnish examples of such improvement; and it is hoped that these will be regarded as a pledge of our anxiety to render the series suitable to the advanced state of knowledge, and acceptable to the enlightened classes of the community.

PRICE THREE HALFPENCE.

INQUIRIES RESPECTING FOOD.

FIRST ARTICLE.

THE poor are in general a complete puzzle to the rich. Travellers, after passing hastily through a country to them foreign, somehow contrive to speak very confidently about the condition of the working population. But when any enlightened person goes amongst the poor of his own country, and endeavours to ascertain whether they are well or ill off, it is ten to one that all his inquiries only lead him farther from certainty than he was at the beginning. Ask any hundred Englishmen of the middle class if they believe the labouring population to be in comfort, and the answer, in all probability, of fifty, will be in the affirmative, and of the other fifty in the negative. It is a subject on which the middle classes in general have no exact knowledge, nor do they appear to have the power of obtaining any. Their own situation and wants are so different, that they can form no judgment of the case of the labouring classes, nor of what measures may be calculated to do them good. It was a saying of Mr Walker, the magistrate of Lambeth Street, "Let any scheme for the maintenance of a labouring man be devised by a gentleman, and you will always find that the labouring man will live at a cheaper rate than that estimated." They have ways altogether past the gentleman's finding out. A lively proof of the utter incompetency of gentlefolks to form an estimate of their condition, was afforded a few years ago, when queries as to what families earned, and whether they could lay by any thing, were extensively circulated amongst clergymen and others serving in parochial offices in the metropolis. From some parishes, the answers averred that labouring families earned in all L.49, and could live, but not save, upon it. In other parishes, they were said to earn L.60, upon which, also, saving was said to be impossible. In St Leonard's parish, Eastcheap, a family might earn L.78, from which they could save nothing. In Holy Trinity the Less, the family earnings reached L.93, which afforded spare diet, but on which nothing could be saved. And in St Anne's, Limehouse, where L.100 a-year could be earned by a labourer and his family, still it was barely sufficient for sustenance, and permitted of no saving.* Here we have some families, to all appearance earning twice as much as others, and yet thought by gentlemen to be not a whit more easy in their circumstances. About the same time, when inquiries were made amongst a similar class of persons in Devonshire, as to whether any of the agricultural labourers were able to save from their earnings, some of the gentlemen answered that a few of the labourers had trifling sums in the savings' banks, while others either expressed a doubt if the thing were possible, or flatly stated their conviction that it was impossible; and yet it was found that L.70,000 had been deposited in the savings' banks of the county by about two thousand such labourers, being one out of every ten of that class of men in the district.

While the non-operative part of the community are thus unfitted by the difference of habits and of sphere for coming to a clear understanding of the condition of the working population, there is a want of ascertained principles in political and natural science with reference to this subject, which makes the case doubly perplexing. To a very recent time, nearly every thing done for the relief of the labouring classes in distress was calculated to do them injury rather than good: by following out the first dictates of benevo-

lence in their behalf, a system had been formed, which threatened utterly to demoralise the poor, and make poor the rich; and it is only now that better principles are dawning upon us. We are unsettled upon a scarcely less important point, the amount and kinds of nutriment which are necessary for the health of the labouring classes. This is a subject on which all are alike ignorant, for as yet it has never been the subject, to any serious extent, of philosophical inquiry. It is one, however, of great importance, and we are anxious to do what in us lies, by means of a work of unusual circulation, to turn public attention to it.

Workhouses, prisons, and other places where large numbers are fed on a regular plan, are obviously calculated to afford some data on this point; and we have accordingly done our best to collect from those quarters all that is at present to be learned—for, it may be as well to say beforehand, experiments would require to be made on a large scale, and with the most critical attention, in order to ensure perfectly satisfactory conclusions. Some of the following facts are the result of personal observation and inquiry, and others are derived from a national document already quoted.

The most liberal systematic allowance of provisions that has ever come to our knowledge, is that made to the convicts in New South Wales. It consists of 10½ pounds of meat, 10½ pounds of flour, 7 ounces of sugar, and 2 ounces of salt, with tea and tobacco at the discretion of the master, per week—being at the rate of 48 ounces of solids a-day, one half of those solids consisting of animal food. The next best is the allowance to convicts in the hulks, which consists of 14 pounds 5 ounces of solids, with 7 pints of beer, a-week, being at the rate of nearly 33 ounces of solids a-day, one third of which is animal food. Prisoners between apprehension and trial, in jails conducted on the common old principles, are next best off, having in some districts above 200 ounces of solids a-week, or about 29 ounces a-day, of which two ounces are animal food. Soldiers are provided, by the warrant for the pay of the army, with a pound of brown bread and three quarters of a pound of meat a-day, or 28 ounces solids, not more than sixpence being for this deducted from their pay, the remainder of which may enable them to purchase other comforts. Under the old poor-law, most of the workhouses were conducted on a liberal principle as to provisions. In that of St Mary's, Reading, the weekly allowance to each man, woman, and child, indiscriminately, was 7 pounds bread, 2½ meat, 3 vegetables, 1 pound 9 ounces cheese, and 21 pints of beer, per week, being 13 pounds 13 ounces of solids per week, or 30 ounces a-day, exclusive of beer. In the workhouse of St Lawrence in the same town, from forty to fifty paupers had 150 pounds of meat weekly amongst them. The diet here was so much more ample, and so much more generous, than that of the labouring people generally, that new entrants usually became ill upon it, and were ill for some time, though, after getting habituated to it, they thrived well—and never afterwards left the house. According to a calculation made by Mr Chadwick from official returns, the able-bodied pauper under the old system had, weekly, 112 ounces bread, 84 ounces meat (liable to a reduction of 28 for waste in cooking), 16 ounces cheese, 16 ounces pudding, besides vegetables, soup, porridge, beer, and other comforts, being probably not much less than 30 ounces of solids per day.

A leading object of the authors of the new poor-law was to reduce the diet of all workhouses to the lowest consistent with health, in order that they might not hold out temptations to able-bodied persons who could make a better by labour. It is lower, we

believe, in the south of England than elsewhere, on account of the condition of the labouring classes being there inferior. In the union poor-house of Chorlton-on-Medlock, which we presume to be on a common scale, the diet is as follows. The pauper has on Sunday, for breakfast, 1½ pints rice milk, and 4 ounces of bread; for dinner, 1½ pints milk pottage, and 6 ounces of bread; and for supper, 1 pint of milk, and as much oatmeal porridge as he can take. His breakfast on Monday and all the other days of the week, is the same as the above supper, namely, as much oatmeal porridge as he can take, with a pint of milk, and his suppers on these nights are the same. On Monday and Thursday, his dinner is 4 ounces of cooked meat, and 4 ounces of bread, with potatoes; on Tuesday and Friday, 1½ pint of soup, and 6 ounces of bread; and on Wednesday and Saturday, 2 pints of potato hash, and 4 ounces of bread. The women above sixty have, at their option, tea morning and evening, with 4 ounces of bread and butter, instead of the above breakfast and supper; and the sick have a better diet, under the regulation of the medical attendant. The present writer has not visited this workhouse, but he has carefully inspected that of the borough of Manchester, which, though exempt from the control of the commissioners, is conducted on precisely the same plan of diet. He found that, for 677 inmates, the weekly provisions consisted of 237 pounds of choice beef at 6d., 532 pounds of coarse beef (that is, necks, shoulders, and briskets), at 4d., and 120 pounds of bacon at 6d.—besides the bones, amounting to about 24 pounds; 6 loads flour, 6 loads oatmeal, 18 loads potatoes, 40 pounds rice, 10 pounds tea, 80 pounds sugar, 80 pounds treacle, 80 pounds butter, and 58 pounds cheese, besides beer, &c., being, in all (not allowing for waste), about 33 ounces of solids a-day, whereof 3 ounces animal food. When waste and extra diets are allowed for, the amount may probably be about 30 ounces—a diet not less in quantity, though possibly not quite so generous, as that given under the old system.

Requesting the reader's patience for a few more figures, we shall now describe the diet of two Scottish workhouses, that of the city of Edinburgh, and that of St Cuthbert's, the latter being a parish chiefly consisting of a populous limb or suburb of the Scottish capital. In the former establishment, for an average of 420 inmates, mostly old people (the average age being 62½), the food weekly consists of 21 stones ox-heads, at 1s. 5d. per stone; 5 stone 10 pounds common beef, at 4s. per stone; 3264 six-ounce loaves, 3 cwt. barley and peas, 9½ bolls oatmeal, 560 pints of skimmed or churned milk, 16 pints sweet milk, 72 gallons of beer—besides groceries, wines, and spirits for the sick and aged. This gives about 19 ounces of solids to each person per day, besides milk and beer, and any vegetables which may occasionally be added to the dinner mess. In the St Cuthbert's Workhouse, the weekly consumption of victuals for an average of 524½ inmates, or one-fourth more than those in the City Workhouse, but of whom two hundred are children, is 31 stones of beef (ox-heads, necks, and houghs); 4197 loaves of six and a half ounces, 3½ cwt. barley and peas, 14½ bolls of oatmeal, 399½ gallons milk, and 157 4-5ths gallons beer; exclusive of cabbage, greens, &c. The daily allowance to each person is stated by the parish authorities to be 8 ounces of meal, 2 of beef, 6½ of bread, 1½ of barley (besides greens), making in all 18 ounces of solids, with 4 gills of milk, or a portion of beer instead. In the Bridewell of the city, the allowance is somewhat larger than in either of these instances, being about 22 ounces of solids; but there the inmates are mostly persons in the vigour of life, and who are also kept at labour.

It thus appears, that paupers in England are fed

* Extracts from the Information Received by his Majesty's Commissioners as to the Administration and Operation of the Poor-Laws. Published by Authority (1833). P. 234.

in a much more liberal style than those of Scotland, the former getting about 30 ounces of solids per day, including 3 ounces of the best animal food, while the latter have only about nineteen ounces, whereof less than two are of meat, and that of the least nutritious kind. It now becomes of importance to learn how the paupers in the two countries thrive on their respective allowances. And here a very surprising result meets our eye. The deaths in the Manchester Workhouse, from September 1, 1837, to August 31, 1838, were 295, the average number of inmates being 708. It is to be presumed, of course, that, as the situation is remarkably healthy, the amount of deaths is not greater here than it is in Chorlton-upon-Medlock, or any other workhouse under the new poor-law; but as we have no information on this point, we are content to consider the return as expressly from the Manchester Workhouse alone. In the Edinburgh Charity Workhouse, during the five years preceding 1831, the average annual mortality amongst an average of 400 inmates, was 61 3-5ths—say, for the sake of round numbers, 62. Thus, in the Manchester Workhouse, 1 dies for every 2 and 8-20ths—or about 2½; while, in the Edinburgh Workhouse, 1 dies for every 6 and 9-20ths, or about every 6½; the mortality in Manchester being nearly three times greater than in Edinburgh. We are not quite sure but that children are included in the Manchester calculations, which may give that house some disadvantage in contrast with the Edinburgh one, where there are no children, and the average age is about 62. But, to give it every fair chance, we shall contrast the mortality with that in the St Cuthbert's house, where more than 200 of the inmates are young boys and girls. The mortality in this house during the year 1837 was 83, out of 524½ of average amount of inmates, being 5½ more in proportion than in the City Workhouse, but still only 1 in 6½ of the inmates—a difference which does not materially affect the comparison.

If, then, the proportion of mortality be a fair test by which to judge of health, and if there be no lurking error in our calculations, it would appear that the diet of 20 ounces agrees better with old paupers than that of 30 ounces. We state the hypothesis with deference to the results of more extensive inquiries, and are far from wishing that it should be rashly acted on. But still it rests on such grounds, and meets with such support from other facts, that we feel justified in pressing it strongly upon general notice. It is not the least remarkable of the supporting facts, that we found the medical attendants, both at Manchester and at Chorlton, inclined to suspect, that, though they were acting for the best under the various circumstances of the case, the diet was *over-abundant*; and this opinion they stated, whilst as yet we were unacquainted with the comparative rates of mortality above stated, and had not a single idea on the subject wherewith to lead them.

The returns from prisons supply a tolerably extensive range of facts, all tending to show that there must be some point at which health is best maintained. "In Suffolk, the food given in the County Jail costs 1s. 9d. per head per week (the food of those at hard labour being 2s. 11d.), whilst at Woodbridge Jail the cost of food is 3s. 6d.: at the former jail there were 10, and at the latter 18 per cent. sick. The cost of food at the Wakefield House of Correction, Yorkshire, is stated to be 1s. 8½d., and 6 per cent. of the prisoners are sick in the year; whilst the food at Northallerton is reported to be 5s. 0½d., and there are 37 per cent. of sick in the year. In the Cold Bath Fields House of Correction, which is a smoky neighbourhood, the prisoners receive a diet of 174 ounces of solid food weekly, and the proportion of sick is 4½ per cent. per annum. At the Guildford House of Correction, a diet of 230 ounces of solid food is given weekly, and the proportion of sick annually is 9 per cent.*** Mr Chadwick, in his Report on the Poor under the old system, says, "The health appears, on the whole, to be better in those places where the diet is moderate, than in those where it is more abundant. Mr Hewitt [master of the St George's Workhouse, Southwark] states that the reduction of diet mentioned by him, which was from 169 ounces of solids weekly to one of 134 ounces [this was a reduction which took place in the house under Mr Hewitt's charge], was productive of no bad effects: the paupers maintained on the low diet were as well, if not better than before the change; and few of them comparatively

to those who had been accustomed to live on a more full diet, suffered by the cholera." Still more precise and instructive information on this point has been acquired since the Poor-Law Commissioners were inquiring into the subject. Returns of the diet and mortality in sixty prisons were obtained, and from these it appeared that the latter rose in an exact proportion to the amount of the former. In twenty houses, where the average of weekly diet was 188 ounces of solids, costing 1s. 10½d. to each person, the sick were 3 per cent., and the deaths one in 622 (we presume, per week). In twenty houses, where the average of weekly diet was 213 ounces of solids, costing 2s. 4½d. to each man, the sick were 18 per cent., and the deaths one in 320. And in twenty houses, where the average of weekly diet was 218 ounces of solids, costing 3s. 2d. to each man, the sick were 23 per cent., and the deaths one in 266.

While these large establishments thus exemplify the consequences of *too much*, they also give us facts showing that *too little* is not less injurious. In the Edinburgh Workhouse, at the beginning of the year 1831, a change took place in the management. Much debt had been incurred by the former directors, great waste was suspected to have been practised, and the new men came in with a determination to give a very different appearance to the accounts. They therefore struck off, per week, 1 stone from the meal, 81 pounds from the barley and peas, and upwards of 3 stones from the common beef. The reduced diet was continued for five and a-half years, and whereas the mortality for the similar preceding period had been 61 3-5ths per annum, it was, during this, 77½, an increase of rather more than a fourth. Since the former diet was resumed, the former rate of mortality has been restored. We thus see, as clearly as possible, that the diet had been taken down below the point at which aged unemployed persons can maintain a healthy existence. It was creditable to the gentlemen managers that, on this being shown to them, they reverted to a better diet. Some years later, a similar change took place in the management of the St Cuthbert's Workhouse; but on this occasion, while the expenditure was reduced, the diet was rather improved than diminished. We gave, in our 142d number, an account of the management of this house, from which it appeared that the support of the inmates cost an uncommonly small sum. We have no reason to fear that the diet of the aged amongst these has been below the point of health; but from facts which came under notice last year, it is not to be doubted that the principle of economy has been carried too far in another important respect. During the early part of the past year, the amount of disease among the young inmates was such as to give a startling view of the circumstances in which they are reared and live. Fifty, being nearly one-fourth of the number, were seized with severe and intractable ophthalmia, or disease of the eyes, which in several cases has ended in impaired vision. From November 1837 till June 1838, 17 died of pulmonary consumption; 70 were seized with hooping-cough, and there were 36 cases of fever. In June, 17 were "afflicted with numerous scrofulous ulcers." Two eminent physicians, who were then requested to inspect the house, and give their advice, reported that "the general aspect of a great number of the children, not labouring under actual disease, is not satisfactory, but is indicative of a feeble, unhealthy state of the constitution, which may lay the foundation of disease in after life." These gentlemen traced the evil to scanty diet and scanty clothing—for it appeared that the dress of the children was the same summer and winter, except in respect of shoes and stockings, there being no under-clothing—while the bedding was also insufficient. The managers agreed to remedy the error to a certain extent, granting an afternoon lunch of bread and milk to the children, which, however, on a partial restoration of health, they have since abridged of the milk. In all this, there is, to the best of our belief, the very reverse of ill intention. The committee of rate-payers who form the management are naturally anxious to make that rate as little as possible; they very properly wish to make the workhouse unattractive to all but the helpless; and, ignorant like the rest of the community of the laws which govern the animal system, they do not trace the effects of insufficient and too little varied diet. If enlightened on this point, we have not the least doubt that they, or any other workhouse managers in the same circumstances, would be led by their humanity to establish a somewhat more liberal system. The fact is nevertheless too valuable, as a proof of the evil consequences of a too low diet, to be here overlooked.

Here, for the present, we must take leave of this interesting subject. The consideration of it will be resumed in our next publication.

GRACE BROWN,

A SKETCH FOR MOTHERS AND DAUGHTERS.*

GRACE BROWN was the pet of the village—pretty, lively, and, like all other pets, very self-willed; but the effects of this latter quality were softened down and rendered quite lovable by her open, generous disposition, which would not allow her to injure another, even to gratify that ruling passion. Some said that Grace thought herself sufficiently handsome, and termed it vanity. True, perhaps, when each Sabbath morning found her ready decked for the sunny walk to the parish church on the hill-side, or the week-day's evening saw her in her little chamber window plying her needle—yes, perhaps then, as she caught a side-long glance at herself in the little mirror, she might think it no such great wonder that the young men gazed as they passed her, or that they looked so curiously at the bow-pots and flowering geraniums perched on the sill of her casement—perhaps, too, she might think they cast a glance beyond. But was this vanity? No; Grace was as free of that hateful quality as the bird which carolled so joyously in his bright cage on the cottage wall. Vanity cannot be justly attributed to those who are only conscious of possessing the qualities which are theirs in reality, but to those alone who boast to themselves of perfections which they can never hope to possess. Such was the case with those who termed Grace vain.

One fine autumn evening she sat, as usual, beside her geraniums, over which was hung her little bird Pet; but the leaves of the former hung droopingly, as though to ask of their sweet mistress the usual drop of spring water, and poor Pet chirruped and hopped from perch to perch, and ruffled his yellow feathers to attract her attention, but in vain. No cooling drop greeted the sickly leaf—no tiny finger placed a bit of sugar between Pet's cage wires. And how was this? Was Grace ill? No; but her thoughts were wandering, and although her eyes were fixed full on poor Pet and his companion plants, she neither saw one nor the other. And whither were her thoughts wandering? Only into a neighbouring lane, up which she strolled when the sun was beginning to dip his bright head 'neath the blue tops of the neighbouring hill. It was a very pleasant lane, but as its sides were bounded by high hawthorn and wild rose-bushes, it may be supposed Grace did not go there for the sake of any beautiful prospect, for her whole height was not more than the top of the banks on which the bushes grew. For what, then, could it be? In truth it was that there generally accompanied her thither a very pleasant companion—not her mother—not one of the neighbours' daughters. No; but a young man, the son of a farmer not far distant.

Yes, the truth may as well be told. Grace had given, or thought she had given, her little heart to this companion of her strolls; and, indeed, any one to look on him, might imagine a better choice could not be made. Tall, handsome, and athletic he was, and his eye beamed when he looked on her. But they who knew him better than Grace, said that he was wild and fickle. Neither did they scruple to warn her of that knowledge. But Grace would not believe. How could she, when she saw that, although they spoke against him, they were always ready to welcome him to their own homes? Besides, there was an eloquence far more powerful to the heart and understanding of Grace—more eloquent, more easily believed than aught they could utter. Yes, the eye and tongue of William Clively were the monitors most eagerly sought, and most willingly listened to when found. How could she think he was deceiving her? There was no falsehood in his deep gaze on her—no harshness in his soft voice. But there was one who did not like him, to whom Grace had ever yet been accustomed to pay the most profound submission, because that humility had never been forced, but ever won from her by love. That being was her mother!

She had now been sitting in this deep reverie some ten minutes, from which she was roused by a light hand being laid on her shoulder. The blood mounted to her temples and cheek, for she knew, without raising her eyes, that it was her mother, and she felt conscious that that mother's eye was reading her innermost heart. She also knew she had ought to be afraid, for though at this moment her little heart had been so-belling, her parent's chiding was ever one of gentleness.

"Grace, love," spoke the mother, gently placing her hand on the half-downcast head, "why do you not go forth this evening? See, the sun has almost lost his last bit of crimson in the deep grey. Come, love: you have been sewing all day. Just throw your scarf around you and walk in our garden."

"I would rather not, mamma," answered Grace in a low tone, turning her head still more from her parent, and then, for the first time, casting her eyes on the drooping plants and now sulky little Pet. But she quickly added, "I will water my trees and chirrup to Pet a little, for he seems quite to have the mores."

* We extract this pleasing little story, from a work lately brought under our notice, entitled "Tales and Sketches, Historical and Domestic, by Mrs D. Clarke, late E. A. Ingram." The authoress evidently possesses much taste and feeling, and we hope that her present attractive volume may meet with such success as will induce her to pursue the cultivation of fictitious literature.

* Condensed in a note to the "Extracts, &c.," from the returns of the Prison Discipline Society.

"And how comes it that he has the mopes, love?" again spoke her mamma.

"Ah! I see, mamma," returned the now half-tearful, half-smiling maiden; "I see you have been reading my heart, and that it is useless to keep any thing from you. But though you have seen part that was passing there, you cannot tell all!"

"But I can guess, Grace; and that, perchance, will do as well. I doubt not you thought me very cruel—very inconsiderate in not allowing you to have quite your own way; and I doubt not that you thought I knew very little about it; but sit down, love, and I will tell you a little passage in my own life, and after that I shall leave you to judge for yourself, only first assuring you that I have every proof that William Clively is very wild, and his father quite unable to support him in his present extravagance. See here, love, I have brought my knitting; so take up your work from the window sill, and thus, while we are quite industrious, I will proceed to tell you that my sketch commences when I was about a twelvemonth older than you are now. At that time, Grace, I was circumstanced, too, somewhat as you are. You understand me, love?" Grace blushed and smiled. "I had a rebellious heart, too; and there was one for whom it was rebellious—one whom it had set up as the idol of its idolatry, and one whom, unfortunately, neither of my parents approved. But yet, Grace, I own that I thought my knowledge of his habits far exceeded theirs; and all I knew of him was fair and open. Things continued thus for above eighteen months, at the end of which time my eyes were fearfully opened to his vices—he committed a forgery and absconded; though it is probable, had he staid, no injury would have awaited him, for his friends, who were wealthy and powerful, made up the sum for which he had risked so much, and paid it. Grace, it was some time, even then, before I could perfectly win my heart from its idolatry; but it had seen its error, and my mind was made up to overcome such perversity, and I did. Yes, Grace; I knew what it was to feel cherished affections warring against my own convictions of right. You will perhaps say that he had deserted me, and it might be that pride rose superior to neglect and slight; but not so. He did not desert me—he did not slight me; for though all others were ignorant of his destination, I knew whither he had fled, and from thence received a letter full of affection and repentance for past follies. But, Grace, had I forgiven, or rather overlooked his vice (for I did forgive), I never could have placed confidence in him again; so I wrote him once, but that once was to discard him for ever. From that time I busied myself in work, in tending my garden, in assisting my neighbours, and, indeed, in various ways of which I had not thought before. I saw that people approved my conduct, too; every eye greeted me, every tongue welcomed me in joyous tones; and in time my own heart grew joyous, and felt a lightness it had never known till then, even in its wildest moments of affection for the now unworthy. But I did not know the fulness of the happiness I was to reap from that one era of my life till five years had elapsed. During that period, love, your dear father had wooed me, and knowing from all that he was beloved and respected, he won me, although not a fifteenth part so handsome or so engaging in his manner as he of whom I have been speaking. But he soon taught me to love him—I do not mean with the girlish wildness I had loved before—but with an affection which might last through sorrow, sickness, death! as it has done, dear Grace!"

The tears started to the sweet eyes of Grace, and fell thickly upon the little border on which she was so busily plying her needle, as the thought of her fond father passed across her heart, and smote it for its rebellion against her will to whose care he had so solemnly entrusted her on his death-bed. The mother was also silent for a few moments.

"Well, love," she at length resumed, "you were but a few months old when, one day, I was sitting with you in a small arbour in the garden of the dwelling where we then resided. On a sudden I heard the latch of the garden gate raised, and a poor emaciated looking man toiled up the sunny walk. He appeared in the last stage of wretchedness, and sickness seemed to add its heavy load of misery where already there appeared to be an accumulation of ill. I rose with an intention of inquiring into his condition, and relieving him as far as my means would permit; and, taking you in my arms, I stood before him. But, Grace, I suppose that time had not so changed me as it had done him, for he instantly ejaculated my maiden name! Yes, love, you may well drop your work and raise your eyes. It was indeed he whom I had loved, and persisted in loving, in opposition to my parents' judgment. At that moment your father appeared at the door, and when I looked on you and him, contrasted with the wretched mass of filth that shrunk before me, my heart leaped with gratitude to God for teaching me to subdue my own evil passions. Your father had known, before our marriage, all the circumstances concerning him and myself, so that a few words made known to him the cause of the surprise pictured in both our countenances; and to make me love and reverence him still more, that good man relieved his present wants and provided for his future ones. Yes, Grace, your father fed, clothed, and lodged that repentant creature in a neighbouring cottage till he recovered health and strength—nay, more, he concealed his name from all inquiring ears, and not an

eye which had once known could now recognise George May!" "George May, mamma!"

"Yes, love; George May! The same who used to pay us the yearly visit from London, to evince his gratitude for your father's kindness. The same who died in our village of decline seven years after, leaving you the Bible and Prayer-book as the only legacy which could be bestowed by poor, but repentant, George May! But now, dear, it is growing quite dark; I will go and see our evening meal prepared, and when we have taken that, pray to your Maker, and then retire to your pillow." And so Grace did; and the next morning, when she entered the breakfast room, she threw her arms around her mother's neck, and whispered that she had gained the victory; she, too, would try if her mind might not overcome the erring inclinations of her heart.

Yes, and Grace succeeded; and twenty years after, when she saw a daughter of her own growing up, she remembered how mildly her own mother had won her from her folly; and she felt that, to be obeyed by that daughter, she must remember that herself had once been a wild and wilful being, and that it is only by placing our own hearts in the situation of others, that we can hope to influence them by our precepts.

THE AFFAIR OF THE MACREAS, AN EDINBURGH PIRESIDE STORY.

"THE title of the Affair of the Macraes was that usually given," says General Stewart of Garth, "to a memorable occurrence which took place in Edinburgh in the year 1778." Arthur's Seat, an abrupt and isolated eminence which overlooks the Scottish capital from the south-east, as even our most southerly readers may probably know, was the principal scene of the occurrence in question. In the year mentioned, this hill or height was taken possession of by a strong body of Highland soldiers, who regularly encamped upon it, and held it for several days and nights in the face of the citizens of Edinburgh, and in defiance of all authority, civil and military, in the country. The particulars of this remarkable affair are as follow.

Kenneth Mackenzie, grandson of the Earl of Seaforth attained for his share in the rebellion of 1715, having repurchased the family estates from the crown, and having been, in 1771, restored to the earldom of Seaforth, was desirous of expressing his gratitude for the favours conferred upon him by his sovereign. In the beginning of the year 1778, he offered to raise a regiment for the public service, from among his own tenantry and followers. The offer was accepted, and the Earl of Seaforth speedily had a body of one thousand one hundred and thirty men ready for military duty, according to his promise. Five hundred of these men were from his lordship's own estates, and the remainder chiefly from the estates of Kilcoy, Applecross, and others belonging to gentlemen of the name of Mackenzie, of which Lord Seaforth was the head. But though the most of this body were Mackenzies, the appellation usually given to the regiment throughout the country was that of the "Macraes," or (as the word is pronounced) the "Macraas," which was the designation of a small and primitive clan that had long followed and lived under the Seaforth family. A number of persons of this name were in the regiment, and hence its general title of the "wild Macraas."

In the month of May, these newly levied troops assembled at Elgin, and marched for Edinburgh. On reaching their destination, they were quartered in the castle and suburbs of the city, and in the course of the month of June were formally embodied, under the denomination of the Seaforth Highlanders, or the seventy-eighth regiment of the line. A finer body of men does not seem to have often presented itself on the like occasions, for the thaws and sinews of the whole of the band were found so unexceptionable, that not one man was rejected. For some weeks afterwards, the Seaforth Highlanders were busily engaged in learning the duties of their new vocation, until they were removed, in the month of August, from Edinburgh to Leith, preparatory to embarkation for service. But where was the scene of that service to be? The regiment had been but a short time in Leith, when this question came to be anxiously agitated among them. A degree of mystery seems to have been maintained on this point among the officers and military authorities. The men became suspicious, and would not believe that the Isle of Guernsey, which was spoken of as their destination, was the real quarter whither they were to be conveyed. They, and almost all of the soldiers raised in a similar way from the Highlands, had bound themselves to serve only for a limited period (commonly three years), and had made it a condition that they were not to be sent out of Britain. In fact, having usually their natural chieftains for their colonels, these regiments rather looked upon themselves as having engaged to follow their superiors temporarily to war in the old way, than as having regularly entered the service of the king and government. Hence the strong sensation that was excited among the Seaforth Highlanders when the rumour spread abroad that they were in reality destined for service in the *East Indies*—in short, that they had been expressly sold to the East India Company by the government and by their own officers. The endeavours of the men to ascertain the truth were far from relieving their fears, or ending satisfactorily. Indeed, the author already quoted, General Stewart of Garth, distinctly says that the

regiment was destined for the East Indies, under the impression that these poor Highlanders were "ignorant, unable to comprehend the nature of their stipulations, and incapable of demanding redress for any breach of contract." This intended violation of compact extended also to an alteration in the amount of "pay, and allowance promised." If this unjustifiable purpose was actually entertained, as there is little reason to doubt it was, the projectors of the scheme met with a disappointment. The "wild Macraas" were not so blind or ignorant as had been imagined. Both in the matter of pay and of service they were determined not to submit to any infraction of their just rights.

The smothered displeasure broke out on the morning of Tuesday the 22d of September, when the regiment marched out to Leith Links, in order to enter the boats which were to convey them to the transports lying in the Roads. A scene of great confusion took place on the Links, which is a large field or green close by Leith, and at a short distance from the shore of the Firth of Forth. When ordered to march to the boats, the dissatisfied Highlanders refused to obey. Their officers endeavoured to soothe them, by promises of answering every just demand, and actually prevailed on about five hundred of the body to move to the sands, and embark. But the remainder, amounting to about six hundred men, were deaf to all remonstrances. Feeling the decisive moment to be come, they were resolute in demanding full satisfaction as to their intended scene of service, before they set foot on board the transports. Compulsion was impossible. The men were a powerful and determined band, amply provided with fire-arms, as well as the means of using them. After a considerable time had been spent in vain discussion, the Highlanders seemed at length to feel the necessity of placing themselves in some position, where they might be able to defend themselves against other troops, if such were called in against them. With this view they left the Links, and marched in regular order to Arthur's Seat, with two plaids fixed on poles instead of colours, and the pipes playing at their head. A great concourse of people attended them on the way. Having reached the hill, they ascended it, and took up their position on and around its top, in proper military order. Sentinels were placed, and every other precaution adopted that men could use, who were resolved not to move from the place until fully satisfied, or ejected by force.

It is scarcely necessary to say that this proceeding created an extraordinary sensation among the inhabitants of Edinburgh. The majority, however, of the citizens, and particularly of the poorer orders, were decidedly favourable to the Highlanders, to whom they soon began to carry provisions in abundance. The mutineers, on their part, showed an equal degree of good will towards the people of the town, and received their visits kindly and gratefully. The authorities resident in the city, civil and military, did not view the matter at all in the same light. Immediately on the occupation of Arthur's Seat by the Highlanders, Sir Adolphus Oughton, K. B., and General Skene, the officers first and second in command of the forces in Scotland, dispatched messengers to all quarters for troops. None of these arrived until the night of Tuesday had been passed by the mutineers, if they ought to be so called, on the hill, which their hardy habits enabled them to do without discomfort, even in the end of September. On Wednesday, a large party of the eleventh regiment of dragoons, a body of two hundred men of the Buccleugh Fencibles, and four hundred of the Glasgow volunteers, arrived in the city. This force seemed sufficient to overpower the Highlanders; but, happily, the commanding officers were disposed to try pacific measures. On the Wednesday, several messages passed between the insurgents and General Skene, and ultimately that officer, accompanied by Lord Macdonald, the Earl of Dunmore, and other noblemen and gentlemen, visited the encampment, and endeavoured to reclaim the men to their duty. The Highlanders received their visitors respectfully, but remained firm in their determination not to yield until fully satisfied that all promises were to be kept with them, both as regarded pay and service. The interview ended unsatisfactorily, and the Macraes spent another night on the hill.

On Thursday, a sudden alarm spread through the city. It was rumoured that the Highlanders had made up their minds to march into the city, either with the view of passing through it, or of seizing upon some sheltered post to entrench themselves in. The dragoons and other troops, it was reported, were to be ready to oppose them. This rumour seems not to have been altogether without foundation, for the authorities issued a placard, early on the Thursday, to the following effect:—"All the inhabitants are to retire to their houses, on the first toll of the fire-bell." Further, however, than regarded the pain of seeing their peaceful streets stained with the blood of countrymen and fellow-creatures, the citizens had little reason to feel uneasiness at this reported movement of the Highlanders, for the latter felt deeply grateful on account of the supplies of food and kindness which they had received at the hands of the people of Edinburgh. But no movement of the kind anticipated took place. On Thursday, General Skene and other parties, including the Duke of Buccleugh, renewed their negotiations with the encamped Macraes, endeavouring to induce them to leave their position, and trust to having all their demands satisfied, on full examination

into them. But the Highlanders would not move, without receiving some pledge, of undeniable validity, that the promises originally made to them would be fulfilled. Another night passed away, and during that interval the authorities came to the resolution of granting the demands of the insurgents. On Friday morning, a bond was drawn up containing the following conditions:—Firstly, a pardon to the Highlanders for all past offences; secondly, all levy-money and arrears due to them to be paid before embarkation; thirdly, that they should not be sent to the East Indies. This bond was signed by the Duke of Buccleugh, the Earl of Dumfries, Sir Adolphus Oughton, and General Skene.

On Friday morning, this document was taken to the encamped Macrears by the Earl of Dumfries. The men now at once gave in, and professed their willingness to leave their position, and submit to the orders that might be given to them. They then formed themselves into marching order, and, with Lord Dumfries at their head, left the hill, with the pipes playing, and a crowd of people following them. On reaching St Anne's Yards, they were met by General Skene, whom they saluted with three cheers. The general formed them into a hollow square, and read the articles of the capitulation. He afterwards addressed a short speech to them, exhorting them to behave well and fulfil their duties. They then received billets, and entered into quarters in the city till their embarkation should take place.

It may surprise the reader, that all this while the officers of the regiment should not have been heard of. But, in reality, it was against these gentlemen that the Arthur's Seat insurgents were most grievously enraged, considering them as the parties who ought to have guarded the common soldiers against any deception. They even charged the officers with keeping back the pay due to them. This disagreement was the more remarkable, as most of these officers were cadets of the leading Mackenzie families, to whom the Seaforth men owed a natural allegiance. The officers were highly displeased at the concessions made to the mutineers. On the evening of Friday, these gentlemen even went so far as to publish in the Edinburgh Advertiser the subjoined statement, which was dated from Lawson's Coffee-house, Leith, and was signed "The officers of the 78th regiment." This advertisement said, "As we conceive the terms granted this day to the mutineers of the 78th regiment to be totally inconsistent with the future discipline of the corps, and highly injurious to our characters as officers, we think ourselves bound to take this first opportunity of publicly declaring, that it was transacted without our advice, and against our opinion. We understand Lord Dumfries was the principal agent on this occasion; we therefore think it necessary also to declare, that he was never desired to interfere by any officer in the regiment, and, we believe, acted without any authority whatever." This effusion of spleen, which, most assuredly, would have got its authors cashiered in later days, was not noticed by the commander-in-chief, or the nobleman who, in conjunction with him, had been the instrument of restoring the mutineers to their duty. On the Saturday, Sir Adolphus Oughton caused a military court of inquiry to sit in the Canongate council-house, where the soldiers were called forward to state any complaints they thought themselves entitled to make against their officers. The issue of this inquiry was, that the court considered no foundation to exist for complaints against the officers on the score of pay or arrears; and declared, moreover, that "the cause of the retiring to Arthur's Hill was from an idle and ill-founded report that the regiment was sold to the East India Company, and that the officers were to leave them on their being embarked on board the transports."

Lord Seaforth, the colonel of the regiment, and on the spot at the time, appears to have sided with the officers, and to have been deeply irritated at the resolute conduct of his clansmen. A report having spread abroad that his lordship had been compelled, on the day of the tumult at Leith, to beg his life on his knees from the enraged soldiers, he published a letter declaring that this was an entire falsehood, that the certainty of immediate death would not have procured from him so humiliating a concession, and that he never had any apprehension for his personal safety during the whole affair. However this may be, the mutiny certainly caused a change at least in his lordship's sentiments and intentions. He had never evinced any disposition to go with the corps; but now, when the matter was settled as has been mentioned, he announced his design to accompany the regiment. On Tuesday morning, September 29th, the band who had created this extraordinary disturbance, assembled, according to orders, in front of Holyrood Palace, and, with the Earl of Seaforth and General Skene at their head, marched to Leith, where, in presence of an immense multitude, they went on board the transports with the utmost alacrity and cheerfulness. Immediately afterwards, the vessels set sail for Guernsey, which, being included among the British Isles, was a place to which they might be carried without infraction of the compact made with them.

Thus ended the affair of the Macrears, which, as may be supposed from its nature, was not soon forgotten by the friends of Edinburgh. Most unprejudiced people agreed at the time in regarding it as a noble and spirited instance of resistance to injustice; as there could be little doubt that the government had determined

send these men to the East Indies, in violation of the compact of enlistment. The poor Highlanders might not be actually sold to the East India Company, nor might it be intended that their officers should desert them, but the design to send them out of the kingdom can scarcely be doubted or denied. The very fact that no man was brought to trial, or even confined on account of this mutiny, proves that the matter would not stand investigation before the eye of the country. The encampment, therefore, of the Macrears on Arthur's Seat, is to be regarded as, on their part, an exhibition of manliness as honourable to them, as the cause of it was dishonourable to others.

The Seaforth Highlanders, or 78th foot, remained for some time at Guernsey and Jersey, until, having satisfied themselves that they were not to be sold to the East India Company, they voluntarily offered to go abroad. Having removed to Portsmouth, they, on the 1st of May 1781, embarked for the East Indies, whither their chief accompanied them. They served their country bravely in that region, and afterwards in many other quarters of the globe. They still exist as a regiment of the line, though their number was changed, in 1786, from the 78th to the 72d, by which title they are now known.

THE ATHENS OF AMERICA.

Of all the American cities, there is none, perhaps, which makes a nearer approach to European sympathies, than Boston, the capital of Massachusetts. This city is less merely mercantile than its neighbours, though still not inconsiderably so. The struggle for the grosser elements of human comfort is here less intense. There is here more leisure for all that gives refinement and elegance. Perhaps, also, the English character is here preserved better—some of its features are seen in more primitive purity, as for instance its indomitable attachment to free institutions. To this cause it must have been owing that the war of independence first broke out here, and that a large proportion of the highest men in that struggle were Bostonians, as Adams, Quincy, Warren, Hancock, the Otises, and Knox. The distinction of the city, in a literary point of view, at the present day, is shown not less expressively in the large proportion which belongs to it of the American authors whose names are known in England—Webster, Channing, the Everetts, Sparks, Sprague, Pierpont, Willis, Mrs Child, Dewey, and Wayland, being all of them natives of Boston. As another expressive proof of the diffusion of a literary spirit in the capital of Massachusetts, we may remind our readers of the *Boston Book*, recently noticed in this paper, a kind of album composed of contributions from eighty writers in Boston, men of all ranks and professions. Perhaps there is no other city in the world which could show so numerous a list of literary names, in proportion to the sum total of its inhabitants, which is 80,000.

Considering these circumstances, we have thought it worth while to give in this place a few particulars respecting Boston in its literary and educational character. They are supplied by a distinguished native, whom we recently had the pleasure of seeing in this country:—

Much of the intellectual precedence of Boston is to be traced to its Common Schools. These are not charitable foundations, as the name might seem to imply. They are the result of one of the first legislative provisions made by the new colonies. Those of Boston have always been distinguished for good management and for abundance of produce. A large part of the great men that city has produced, have been first educated at these humble seminaries, which, though alike open to all classes—being sustained by a tax instituted for the purpose, and levied fairly on all classes—no class has ever manifested any fastidious or aristocratic disinclination to countenance and encourage to the fullest extent. True, they do not go far enough for all, and hence an abundance of seminaries of higher rank, for which also Boston is distinguished. Still, the great boast and bulwark of the city has always been its common schools. A dinner or festival on account of these institutions is given annually in a famous public edifice, called Faneuil Hall, much endeared to the citizens by historical associations, and well hung round with portraits of the great characters connected with their annals, at the head of whom are Washington and Adams. To this dinner, which is regulated by the city governor, are invited the various functionaries and dignitaries of that place and vicinity, the president and professors of the university at Cambridge (three miles distant), the governor and other officers of the state, clergymen of all sects, distinguished political personages of the different parties, and all strangers of distinction, of whom at this season (summer) there is generally a considerable number from the south and west in the city. And to this festival we find are invited all the boys to whom prizes have been awarded at the various schools subsequent to the periodical and public examination they sustain on the morning of the day when the dinner is given. A moderate and cheerful meal is taken at a not unreasonable hour, and then sentiments, and speeches, and odes and songs, suited to the occasion, are expected from parties qualified and invited thus

to contribute to the spirit of the occasion. The first men in the United States have often attended at this board. Mr Webster, himself a Bostonian, but claimed by all Americans as common property, and generally looked upon as their future president, has made some of his best addresses in this hall. Mr Everett, now governor of the state, but much more distinguished as one of the leading popular orators, scholars, and writers of his country, has appeared there of late by virtue of his office, as formerly he did by that of his prize. These are gratifying details, and throw a strong light on the character of the Bostonians. It will be interesting to add, in order to show that this spirit is neither dying away, nor confined within any municipal limits, that within two years the legislature of Massachusetts has established a regular Board of Education, the seat of which is in Boston, the chairman Governor Everett, while some of the most eminent citizens of the state are members. This board is to attend exclusively to the Common Schools. Their office is no sinecure, but the members serve without salaries. The secretary alone receives the sum of one thousand dollars—something over £200—for his time and labour; and it is worthy of remark, that the gentleman who has accepted this office is a most conspicuous lawyer, a member of the Boston bar, and who, at the time of his appointment, held, by election, the very honourable station of president of the senate of the state!

The periodical press of Boston is, as might be expected, in a flourishing state. Our information on this subject is not complete; but we know that there are ten or twelve daily newspapers in the city, if not more. Of these papers the majority may be considered well-established and rather profitable concerns—quite as much so as the average of daily papers, we should say—though certainly not on so large a scale of operation as those in London; neither is the circulation of each or any of this *dosen* equal to that of any, perhaps, of the London *ten*—for there are no more in the "Great Metropolis" itself. These sheets are of the ordinary size, if we except two or three. One of the latter is a very popular evening journal, the Transcript, the size of which is so small as to give it, together with its great neatness, a miniature and curious air, which has doubtless contributed to its reputation. The price of this paper is four dollars per annum; that is, for three hundred numbers, which makes the cost of each about one cent and a quarter, or from two to three farthings. There are one or two cheap papers hawked about the streets, containing about as much matter, and conducted with respectable ability, at the rate of one cent each. This is a recent innovation on the regular press at Boston, as it is still more at New York, where one of these cheap papers is said to have a circulation of 30,000 a-day. With this exception, the newspaper press is supported by subscriptions, never for less, we believe, than three months. The larger papers among the dozen we have named, cost generally eight dollars yearly; we know of none above ten dollars, which is the price of the Courier and other journals of immense size at New York. In Boston, we must add before dismissing the subject, there is quite a corresponding proportion of journals published less frequently; of semi-weeklies, tri-weeklies, weeklies, semi-monthlies, and monthlies (several each), as well as a highly respectable magazine, the Christian Examiner, which is issued every two months, and another, still better known, the North American Review, every three. A second Quarterly Review has lately, we perceive, been added to this. The number of daily papers, we believe, is not so great in either New York or Philadelphia. Certainly it sustains no proportion to the much greater population of those places. In Boston, a householder hardly thinks himself able to sit down to his breakfast without "the news;" and it is no caricature to say that we have ourselves seen some of the more decent and well-established apple-venders and candy-women regularly provided with a daily paper—not borrowed, but subscribed for—at their humble stalls under the old trees round "Boston Common." So much for cheap publications, and an universality and disposition to read, in this American city.

Perhaps the prevalence in Boston of lecturing on matters connected with science and literature, forms its most notable feature as an intellectual city. All lecture, or hear lectures. In this lies, indeed, the grand amusement of the city. About the middle or end of October, the lecturing campaign, as it may be called, begins; and then, for four or five months, Boston resembles the *live* so beautifully described by Virgil; such is the universal, and hearty, and steady, but quiet interest taken by all classes in these half-social half-literary and scientific pursuits, which may be considered at once the business and the amusement of the season. We have seen a list of the popular societies of Boston which have courses of lectures, or debates, or both, with sometimes other exercises and exhibitions of like tendency and intention; and this catalogue, could we repeat it here, would be a curiosity. To state the number at a dozen, we are sensible would be falling much short of the mark. There is the Society for the Diffusion of Useful Knowledge, the Natural History Society, the Boston Lyceum, the Hanover Lyceum, the Mechanics' Charitable Association, the Mechanics' Lyceum, the Franklin Debating Society, &c. &c. Of the first-named of these, Mr Webster is president. It gives weekly lectures by the most eminent scholars

of the country, in a hall which accommodates about one thousand persons, and never fails to be full. The Boston Lyceum, which has existed some ten years, does the same with from two thousand to three thousand, in a great edifice reconstructed for these purposes out of what was once the principal theatre in the city. And so on with the rest. Thus large audiences may be entertained on the same evening in the various halls. Some prefer one course, and some another; and a person may have one or two lectures, if he chooses, each evening of the week, Sunday excepted. The rich and fashionable attend quite as much as any other class; but there is always seen at these lectures an immense number of young men, clerks, and others, many of them from the country. These persons, for about a dollar (four shillings and three pence), find themselves able to attend a course of sixteen or eighteen lectures and debates, and moreover to take any two young ladies of their acquaintance with them, which it is much the fashion to do. The social, moral, and intellectual effects of this system—setting aside all direct literary consideration—can hardly be overrated. We have never seen a spectacle so truly exhilarating as the Boston "Odeon" (the old theatre), well filled in all its galleries and aisles—stage and all—with an animated, well-dressed, quiet audience, of some twenty-five hundred persons, patiently awaiting for half an hour the commencement of a lecture—some distinguished stranger it may be, some eminent citizen, or possibly some not yet eminent but youthful and promising member of the institution itself, whose rising talent it is the generous and noble policy at once of the officers and of the public to encourage. We have heard Webster, the Everetts, Sparks, Dewey, Pierpont, Barber, Spurzheim, the professors of the neighbouring university, the candidates for the presidency, the governors of the state, the distinguished clergymen of every denomination, all and often on these occasions. The reputation of the city, indeed, attracts popular talent from all quarters, and in every department, for the good reason that it finds there a genial reception, and a just and generous reward. Such a community deserves also the happiness and the multi-fold benefits which it must reap from the system it pursues. It deserves its pre-eminence, its high reputation, its good order, its freedom from poverty and crime. Would that the example, both of its condition and of the causes of it, might incite other communities to like liberality, energy, and true wisdom and thrift!

THE OLD LETTER-WRITER OF PARIS.*

AMONG the monuments and memorials of old times and manners still existing in Paris, the *Palais de Justice* (palace of justice) contains beneath its vast roof some of the most interesting and best preserved. This remark applies, in especial, to the beings called Public Writers, who have for ages clung around the establishment in question, and who still adhere to its sides, pent up in their little glass stalls, like oysters to their rocks. For the benefit of those unacquainted with such matters, it is to be observed, that in Paris, as well as in Naples, and many other cities, where a considerable portion of the community cannot boast even of the elements of education, there is an order of persons who live by writing and reading letters, drawing up petitions, and performing the like services for those who are unable to act in these matters for themselves. The Public Writer of the *Palais de Justice* is not remarkable merely as belonging to this class; for in Paris the trade is common, and its professors numerous. But the Public Writer particularly alluded to does not push himself before the public as his modernised brethren do, nor does he seek to attract attention by the exhibition of wonderful specimens of calligraphy—such as a satire of Boileau enclosed in a fiery heart pierced by an arrow, or a sermon of Massillon inscribed within the compass of a copper coin, or a history of Napoleon inclosable in a nut-shell. No placards with "English spoken hire" upon them, indicate the pretensions of the Public Writer of the *Palais de Justice* to the character of an able translator, as they do on the doors of many of his more ostentatious fellows. He keeps his little dusky stall in peace and retirement, as his predecessors have done for centuries, and it is for his preservation of all the antique features of his tribe, that he is an especial object of interest.

My acquaintance with this living memento of other days arose, a number of years ago, out of some rather peculiar circumstances. I was then the assiduous and devoted admirer of a certain lady, the register of whose birth I became anxious to see, partly with the view of assuring myself of her own veracity, and partly with the intention of putting a stop to the remarks and epigrams which various good-natured friends of mine were in the habit of giving vent to on this particular point. Within the precincts of the *Palais de Justice* are kept the registers of births, and thither accordingly I bent my steps. I readily found the register-office I sought, and made my business

known to the head clerk of the place, giving him at full length the name and surname of the party alluded to, and pointing out a period eighteen years back as the best indication I could give to guide the search in question. It is needless to say that I here went upon the authority of the lady herself, and not on that of my bantering friends, who made out that her age was forty at least. The clerk laughed outright when he heard my directions, and remarked, that if all who came to the office had no more explicit instructions to give than mine, it would cost a day to make each individual extract. "We cannot spare time to make the search," continued he, "but you may do it for yourself; or, if you choose to pay a small sum, you may find a person who will do it for you." I expressed my readiness to take the latter step, when he immediately directed me to a little stall, a few steps off, where I would find a person for my purpose. I followed his advice, and soon found myself in the presence of one of the old Public Writers of the *Palais de Justice*.

The office of this personage is deserving of description. It was one of two or three small sheds, laid slopingly to the walls of the *Palais*, and could not be more than six feet long by four wide in the interior. A large part of the outside was glazed, and the proceedings in the inside were hid from the public eye by a green baize curtain, thickly spotted with ink. A desk, supported upon a table, or rather a plank, and two old and fearfully worn chairs, composed the furniture of the stall. On one of the chairs sat the presiding genius of the place, with a small portable fire-grate before him, on which, at the moment, a herring was undergoing the process of cookery, through the help of a rusty black pair of tongs. The oil of the fish was dropping into the embers, and emitting an insupportable smell. The preparer of this delectable dish was a man seemingly about sixty years of age, dressed in threadbare garments of the olden fashion. His countenance was good, and a mingled air of gravity and fun was perceptible in its expression. The most remarkable feature in his physiognomy was the sloping character of his nose and brow, which formed one continuous inclined plane, the length of which was greatly extended by his combed-back hair, terminating behind in one thick queue. What with nose, brow, and hair, the head very much resembled a sugar-loaf. There was, on the whole, a strange mixture of respectability and wretchedness in the appearance of M. Fabry, which was the name of this specimen of the ancient class of public writers, as I afterwards ascertained. I was not long in making my request known to this personage, who, with the most polished courtesy, expressed his willingness to undertake the commission, but informed me that some time would be required to procure the register-books and execute it. Throwing down a louis on the table, I departed, promising to return on the morrow for an answer to my inquiries.

Next day, when I returned at the appointed hour, M. Fabry was alone, and by the increased colour on his cheek, and the fire in his eye, I concluded that the louis had already procured him some of the passing comforts of life. On the desk beside him lay a folded paper, which I conjectured to be the treasure I sought. I stretched out my hand eagerly to seize it, but M. Fabry anticipated my act, and said solemnly, "To what purpose, young man, do you destine this document which you have made me extract?" "What matters this to you?" said I hastily; "are you not sufficiently paid?" "It is because I am too well paid," replied he, "that I make this inquiry. You cannot have fallen heir to this lady, otherwise you would probably be in mourning. I fear, therefore, that you seek this extract with some evil design." I answered angrily that there was no such purpose in my thoughts. "Young man," he returned, "your trembling hand betrays you. I beseech you, if the suspicion I have expressed be correct, to have patience at least till to-morrow, and get this extract from some other hand than mine. For the repose of my few remaining days, I entreat you not to make me again the blind instrument of some act of vengeance!" Struck by his serious tone, and incited by curiosity, I asked him if he had to repent of some culpable act of his life, assuring him, at the same time, that in my case he could have no room for any regret.

"My life," said M. Fabry, "has been all spent in this little place, and yet this has been a more favourable scene for acquiring a knowledge of the human heart, than any other, perhaps, that could be pointed out. This place is to me full of remembrances of all kinds—of mirth, misery, and crime." The speaker fell for some moments into a reverie, which I did not break in upon. "Poor young man," resumed he at length, as if soliloquising upon some recollected incident, "poor young man, there he stood, a few paces from my door, trembling with hope, joy, and love, while a beautiful girl entered stealthily into my presence, and dictated to me these few words, 'This evening, at six, in the alley de Berry.' Oh, how I hastened to pen these sweet words, almost participating in the rapture which they were to give to the youth without. The girl got the line, issued, and I saw her slip it furtively into the hands of the young man, when each stole away by their own side." "Well! what happened?" said I, for M. Fabry had stopped. "It happened," continued he gravely, raising his head, "that the next morning the young man was found in the alley de Berry, robbed and murdered; it happened that I had been the instrument of entrapping and leading a poor youth to assassination." "It was frightful," ejaculated I. "Yes,"

rejoined M. Fabry more cheerfully, "but all the associations of this place are not of so terrible a character. On the contrary, most of them are of the mirthful, the pleasing, or, it may be, the ridiculous cast. For the convenience of the damsels of the street St Denis, in their communications with the young shopmen and tradesmen around, I have copied the New *Eloisa* twenty times over. And then my poetry: I flatter myself it is of the most ingenious sort. Some of my fellow-writers have a hundred copies of verses, to suit all occasions. I have but one copy of verses, for my part, and yet, with a very little change, it suits all occasions as well as theirs. Suppose a son wishes to address a father on his birth-day. Thus runs the commencement of the verse:—

'Accept, on this most loved of days,
The homage which a son now pays.'

And so on. Suppose a daughter is the addressing party, then all the change required is,

'The homage which a daughter pays.'

Or if a brother,

'The homage which a brother pays.'

If a king is to be addressed by his subjects, the verse still answers the demand,

'The homage which your people pays.'

M. Fabry paused, and appeared to be much pleased when I commended the universal utility of his verse. He had warmed with his subject, and continued to describe to me how many petitions he had drawn up, how many public defaulters he had been instrumental in denouncing, and various others of his professional feats. "But there is one portion of a public writer's practice more productive of profit than any other, though God forbid that I should ever pursue it. Every line is paid with gold, yet I would rather have my hand cut off than that it should gain a coin in this way!" "To what do you allude?" said I, rather surprised at his earnest vehemence of tone. "To anonymous letter-writing," returned he. "By the hands of those of my calling, most commonly are the secret shafts launched which pierce and rankle in the bosom of society. Oh, sir, beware of anonymous letters! Read them not; cast them from you. For even when sent in sport, their consequences are often horrible. Listen to what fell under my own eye. Some years ago, Juan de Varre, a young advocate of high promise, espoused Eliza d'Arnoule. The pair were tenderly attached to each other, though their characters were somewhat different, Juan's being calm, grave, and firm, while his wife was of ardent temperament and quick feelings. M. d'Arnoule, his father-in-law, thought that Juan paid too constant attention to the duties of his profession, to the exclusion of all social pleasures; and on one occasion was particularly pressing in his wish that the young advocate and his wife should go to a masked ball, which was to take place in the city. Juan excused himself, on the score that he was under the necessity of going to plead a cause at Senlis on that day. When M. d'Arnoule turned to his daughter, he found her also indisposed to go, through deference for her husband's wishes. Piqued at this, M. d'Arnoule laid a plot for bringing his daughter and Juan to the masquerade in spite of themselves.

He came to me," continued M. Fabry, "and requested me to write two letters, the one to Juan, informing him that his wife was going to the ball to meet another person, although she had shown no desire to go with her husband; and the other was addressed to his daughter, containing the information that Juan's business at Senlis was a deception, and that he was going to the ball, to fulfil an appointment with a black domino, bearing on her arm bracelets tied with blue ribband. These letters were sent off unsigned. The consequence was, that, when the hour came, the young wife, concealed under a mask of the kind described, rushed to the scene of the masquerade, her bosom in a whirl of conflicting emotions. The bacchanalian licence of the scene almost frightened her into retreat, but while she stood apart, a figure masked and cloaked passed her. It was the very air, gait, and person of her husband. 'Is it you, Juan?' she whispered. 'Yes, it is I,' said the mask, in similar tones. These words convinced the young wife that the information given to her was correct, and that her husband now mistook her for the person whose dress she wore, and whom he had come to meet. Though every word uttered by the masked figure cut her to the very heart, she, taking the speaker for her husband, encouraged his attentions, in the burning desire to know the whole depth of his perfidy. Shortly, however, she felt herself sick at heart; she could not sustain the character of an impostor, and hastened away from the odious scene. On issuing from the gateway, a pale and awful figure stood there, in the full light of the lamp; a figure without a mask; the figure of Juan. The wretched young wife saw him, uttered a dreadful and appalling shriek, and fell prostrate at his feet! Juan scarcely looked at her, but sprang over her body, and stood front to front with the masked figure who had followed her steps. Few words passed between them. They retired a short way aside, drew their swords, and in a few minutes the unknown personator of Juan fell lifeless on the ground.

M. d'Arnoule was the first person who found his daughter where she had fallen. The unhappy lady was conveyed to her home, and restored to life, but never again to reason. She yet lives, indeed—lives to be a fire of perpetual remorse to her father, and an object of undying pity to Juan, who learnt the whole story of the two letters from myself. Behold, young

* We have translated this graphic sketch from a French work, entitled "The Hook of the Hundred and One."

man," said M. Fabry, in conclusion, "behold one instance of the results of anonymous letters, written with innocent intentions!"

M. Fabry had held my paper in his hand all this while, and he now gave it to me. After this, he fell into a musing state, from which I did not attempt to arouse him. I bade him good evening, and took my way homewards, so much occupied with the thoughts of what I had just heard, that my own trifling matter of inquiry was entirely forgotten; and from that day to this, I never hear of an anonymous letter without having brought to my recollection the admonition of the Old Letter-Writer of Paris.

A FEW WEEKS ON THE CONTINENT.

MAYENCE, WORMS, MANNHEIM, AND HEIDELBERG.

WE have now reached Mayence, and after a lengthened navigation up the lower and middle divisions of the Rhine, landed on a broad and generally level district, bounded in the extreme distance with lines of hills, and constituting what may be termed the upper platform of Germany. We are now in the midst of a number of small principalities or dukedoms, which, thirty years ago, formed the Confederation of the Rhine, and are at present, with their respective sub-sovereignities, integral parts of the German empire.

The situation of Mayence, close upon the left bank of the Rhine, at a short distance below the spot where the Maine falls into the right side of that river, is both agreeable and suitable for an entrepôt of commerce; but, as in the case of Cologne and Coblenz, the town labours under the cankered evil of a military system of things, and is consequently deprived in a great measure of its natural advantages. The history of Mayence resembles that of every town on the Rhine—originally begun by Romans in the first century—taken by Germans—falls into the hands of the Frankish kings—becomes a temporal principality of archbishops—these succeeded by dukes—now a city of Hesse Darmstadt, and a garrison of the German confederation, for protection of the left bank of the Rhine. The town, which contains 31,000 inhabitants, is environed with strong fortifications, and, according to custom, the Rhine is all but shut out and prevented from serving the purposes of commerce, in consequence of erections along the edge of the water. The accommodation for river craft is on the same trifling scale as at Coblenz. In the interior of the town there are several good streets and places, with various indications of improvement, but most of the best houses have strongly stanchioned windows, and in almost every street we see a barrack of soldiers. The garrison is composed of the troops of two nations, Prussia and Austria; the former are, as usual, a smart body of men in blue uniforms, while the Austrians, in their dirty white dresses and mustachioed countenances, seemed to us as ill-favoured a set of men as could well be conceived. How melancholy is the reflection, that the place whence the glorious art of printing emanated and spread over the civilised world, every where enlightening and freeing from oppression, should itself be still surrounded, and literally crammed, with emblems of violence!

Notwithstanding the uncomfortable condition of the streets, we spent a day by no means unpleasantly in exploring the antiquities and principal public buildings of the city. First of all, in the course of our rambles, we sought out the spot where Guttenberg had lived when he set up his first printing-press. This we found in a narrow crooked alley, environed with tall massive stone buildings, one of which, a casino or club-house, now occupies the site of Guttenberg's dwelling. Nothing, therefore, remains at the place to satisfy the curiosity of strangers, and we proceeded to the neighbouring market-place, where the statue of Guttenberg has been erected by the munificence of the citizens and others. This object greatly disappointed our expectations. It is a clumsy gigantic figure in bronze, cast by Crozatier of Paris, from a model by Thorwaldsen, and stands on a pedestal of some ten or twelve feet in height. Perhaps it may be reckoned a sort of crime to find fault with any thing done by a great name, but I must in justice confess, that a coarser or more tasteless work of art never came under my observation. From viewing this very poor object, we adjourned to the Cathedral, which stands behind, on the same side of the market-place, and is a handsome old edifice of red sandstone. In 1793, it was bombarded by the Prussians, and made a forage-magazine for their horses, but has since been completely cleaned and restored in those parts which were destroyed. The marks of the balls fired against it are visible on the great folding

doors next the market-place. These doors are of solid brass, and, besides being of an imposing height, are remarkable for being covered with ancient and scarcely legible inscriptions, which I was told are charters of privileges given to the town by one of its archbishops. The interior of the building contains a number of fine old carved monuments, and has several altars with embellishments of the usual kind.

The most beautiful of all the sights at Mayence is that of the Rhine, which fortunately no institutional arrangements can destroy. From the lofty windows of the hotels in the exterior street, the river is seen flowing past with a breadth and majesty of appearance apparently as great as at Cologne. Opposite the centre of the town, there is a platform bridge resting on forty-seven barges moored in an even line in the water, and nearly in the same situation as a stone bridge built by Drusus, the Roman general, but long since destroyed. By the bridge of boats a ready communication is kept up with Nassau, Frankfort, and all other places on the right side of the Rhine. The wide and flat vale through which the Rhine winds its course before it passes Mayence, is fertile, and well clothed with woods, vines, and hop plants, as far as the eye can reach; and through this richly decorated district, the river, diminishing as we ascend, may be traced to Worms, Mannheim, and other towns on its course. Rising among the mountains of Switzerland, and gathering accessions to its magnitude as it advances, the Rhine pursues a course—generally towards the north-east—of about nine hundred miles in length, upwards of six hundred of which afford an uninterrupted navigation. At Mayence, the larger class of steamers cease to ply, and others of a smaller kind are used for ascending to a point near Strasburg, where water conveyance terminates.

Taking a private land conveyance from Mayence, our little party set off on an excursion through the interesting tract of country lying immediately beyond that city, comprehending a portion of the territories of Hesse Darmstadt, Baden, and Bavaria, it being our intention to return by Frankfort and Nassau. In making this agreeable round, which was calculated to show us the appearance of things in these small German states, the first place of any moment we touched at was Worms, a town of singularly ancient and decayed appearance. Worms is situated on the left bank of the Rhine, in the midst of a flat and fertile region, chiefly devoted to the cultivation of the vine, and celebrated in the lyrics of the old German poets or Minnesingers, as the Wonnegau, or land of joy. In the middle ages, Worms was a populous city of considerable note, and is famed in history as the seat of a number of diets of the German empire, at one of which, presided over by Charles V., in 1521, Luther appeared to answer for the propagation of what were called his heretical doctrines. Since these its days of greatness, Worms has sunk into the condition of a small country town, though yet possessing a certain dignity in its melancholy decay. The greatest blow which fell upon it, was the bombardment by the French in 1690, when a vast number of its houses were destroyed, and their situation is now marked by vine gardens within walled enclosures. The interior of the town consists of a single good street, lined with tall mansions inhabited by persons of an inferior order, and a number of back lanes and detached buildings, many of them vacant and desolate in their aspect. In a piece of open ground behind the main street stands the Cathedral, a building of red sandstone, and dating its foundation as far back as the beginning of the eleventh century. The original part of the edifice is in the Gothic style, but the larger portion, which appears more modern, is of the remarkable style of architecture called the Byzantine, the interior arches being all rounded, and the pinnacles and dome fretted in the Moorish taste. The building contains a number of excellent pieces of sculpture, and the high altar at the east end is environed with ancient carvings in oak, which it would be worth any young artist's trouble to visit, even from Great Britain.

From Worms we proceeded onward to Mannheim, which we reached in about two hours. Mannheim is one of the prettiest towns in Germany, and occupies a delightful situation on the right bank of the Rhine, which we crossed by a bridge of boats. We see here no confinement within walls, no dirty, narrow lanes, and none of that generally poverty-stricken appearance which meets us at every turn in the towns we have passed through. Mannheim consists of a series of pleasant open streets, crossing each other at right angles; the houses clean, of dazzling whiteness, and only three stories in height. There are also several large squares,

surrounded with buildings of a superior order, and on one of the sides of the town near the Rhine, stands the palace, a structure of extraordinary extent and magnificence. Mannheim, though not the capital, is the principal city in the dukedom of Baden. Before its annexation to this power in 1802, it was the capital of the palatinate, a state now merged in the adjoining principalities. The town has been built almost entirely within the last century. In the present day, it is thriving apace, both as a place of residence for a respectable population, among whom are two or three hundred English, and as a seat of manufactures. The general society of the town is said to be excellent; a spirit of perfect toleration prevails, and the cost of living is exceedingly moderate. At the time of our visit, the price of bread was about a penny, and beef threepence, a-pound; consequently, the charges for other things, the produce or manufacture of the district, were in proportion; yet, we were told, there are cheaper places of living in this quarter of Germany than Mannheim, but I should hardly think possessing superior attractions in other respects. In the environs of the town there are some pleasant walks, both on the banks of the Rhine, and on the left bank of the Neckar, a river which falls into the Rhine a short way below Mannheim. The palace, which we were conducted over, is of modern architecture, having been built by Karl Philip, Elector Palatine, in 1720, when he removed his court from Heidelberg. It is in the form of a centre and wings with façades, covering a large space of ground, and containing altogether 443 apartments; one wing remains in the condition of a blackened ruin since the bombardment by the Austrians in 1795. A long suite of rooms, fronting a beautiful lawn overlooking the Rhine, forms the residence of the grand-duchess Stephanie, whose amiable manners shed a lustre over the society of the town. From the rooms devoted to this lady's court, we went through a series of galleries containing a collection of pictures, to which no traveller, as far as I am aware, has done justice. The peculiarity of the collection consists not in its boasting of many chef-d'œuvres of great masters, but in the excellence of pieces by painters of generally inferior celebrity. Judgment, not name, has guided the choice, and we accordingly find a number of pictures done with exquisite skill. The best are by Bergheim, Spranger, Le Seur, Guido, Remi, Cuypp; Peters, a sea storm; Roos, cattle; Murille, satyr and peasant; Teniers, boors drinking and dancing; Evertingen, rocky landscape; Wouven-manna, warlike rapine; Mayer, landscape with cattle; Rembrandt, Christ before Pilate, and Christ writing on the floor; Tinteretto, Crucifixion; Ruysdael, landscape; and, lastly, Houderotter, birds. These, however, are a mere scantling of this finely selected collection, which no description can convey a correct idea of. Adjoining is a gallery of casts, forming a studio for young artists. On the lower floor of one of the wings of the palace is an extensive museum of objects illustrative of natural history, and is particularly rich in fossils, stones, minerals, and petrifications; an exterior arcade is filled with ancient Roman stones.

Having gratified ourselves with a visit to all that was interesting in this neat German town, the place to which we next directed our route was Schweitzingen, once a seat of the electors palatine, and now belonging to the grand-duke of Baden. Schweitzingen consists of a quiet and rather pretty village, with a stately old whitewashed chateau at the head of its principal street, and behind which are spread out a series of extensive gardens and pleasure-grounds, in the formal French style of a past era. The designer was the famous Le Nôtre, who, under the auspices of Louis XIV., laid out the garden of Versailles, to which the present bears a marked resemblance. On entering by the portal at the chateau, the eye at once embraces the interior of the principal garden, disposed over an extensive flat, with basins from which leaden figures are busy spouting water, marble statues, trim even walks, and parterres of flowers, the whole bounded by close-cut hedges and lofty trees planted in lines, so as to form long and imposing avenues. Penetrating among the hedge-alleys, we are conducted from one curiosity to another, artificial grottoes, rocks and waterfalls, ruins of the temple of Mercury, the temple of Minerva, the bird's fountain, bath-house, a mosque, and so forth—all in a state of good preservation, and looking as if only lately come from under the hands of the designer. Yet, how dull and melancholy is the scene! The sun shines brightly overhead, the flowers bloom, the jets of water play, and all is kept as trim as if the elector palatine still held court in the adjoining chateau; but except a passing stranger, moved by curiosity, there is no one to witness the exhibition; the show is without spectators, and the whole mechanism seems to subsist only as a preserved specimen of what used to delight courtiers of the ancient regime. The gardens, and all the oddities about them, were begun to be constructed in 1743, by the direction of the Elector Charles Theodore, and required twenty years to finish. The vast sums which must have been expended in completing the work, it is impossible to calculate—and all to produce a toy, which is now thrown aside and forgotten.

Schweitzingen lies nine miles south from Mannheim, and at a similar distance west from Heidelberg, to which we now traced our way. The roads in Baden are as excellent as they are in Prussia, being macadamised in the usual manner; and by an easy drive of an hour and a half, we reached the valley of the Neckar early in the evening, while still sufficient light remained to show us the magnificent ruined pile known in history

and romance as the Castle of Heidelberg. The town of Heidelberg, one of the oldest in Germany, occupies a confined situation in the valley of the Neckar, just within the range of mountains called the Odenwald, which forms the eastern boundary of the wide flat vale of the Upper Rhine, through which our route has lain. From the left bank of the Neckar, the streets and lanes of the town stretch upwards on the base of a hill, on which, over all, in the midst of masses of foliage, stand the ruins of the castle, majestic even in their shattered decay. The valley of the Neckar, at this its opening, though not wide or picturesque, offers a scene of much beauty. Immediately opposite the side on which Heidelberg stands, rises a hill which is covered to the summit with vine gardens, and at the foot is ornamented with several handsome villas, somewhat in the English style. From between the hills on both sides, the Neckar, a stream navigable for small vessels and rafts, is seen to issue after a long serpentine course, and on gaining the open country pursues its way to the Rhine. At Heidelberg it is crossed by a stone bridge of six or seven arches, and from the further extremity of which the most picturesque view of the castle is to be obtained.

The town of Heidelberg is long and straggling, consisting of tall antique stone buildings, with moss-grown tiled roofs. Some of the edifices are embellished in front with variously carved figures and inscriptions, having survived the general destruction to which the town has at different times submitted from the hands of warlike assailants. At present, the population amounts to about 13,000. The town has been long noted as the seat of a university, which, since the district came under the jurisdiction of Baden, has been munificently endowed by the grand-duke and his legislative assembly. The university has nevertheless declined in prosperity, in consequence of an attempt on the part of the students, a few years ago, to revolutionise Germany. The institution forthwith incurred the displeasure of Prussia; and by a law now in force, no youth from the Prussian dominions is permitted to study at the university of Heidelberg. As a transient visitor of the town, I am of course unable to pronounce any opinion either on the character of the instruction communicated, or on the qualifications of the professors; as for the students, their loud yellings in the street during most part of the night, formed, as we thought, a sufficient testimony of their wildness, without at all taking into account the slovenliness and general recklessness of their appearance. It is not the burghers of Heidelberg who are to be the regenerators of constitutional government in the wide bounds of modern Germany.

The chief object of interest which came under our notice in exploring the ancient streets of Heidelberg, was the church of St Peter, an old and handsome Gothic structure standing in the open market-place. It was neither, however, the appearance nor the antiquity of the edifice that gave it an interest in our eyes, but the event in history of which it had been the scene. Jerome of Prague—a name which can never die—here first promulgated his reforming sentiments in religion, and on the door of St Peter's church nailed the theses containing those doctrines which he afterwards sealed with his blood. He was publicly burnt at Constance in 1416, and his ashes thrown into the Rhine, about a year after his friend and fellow-labourer John Huss had undergone a similar fate. It is impossible, therefore, to pass the door of St Peter's without feeling that species of emotion which a visit to scenes of deep historical interest is calculated to excite. Heidelberg, as is well known, became celebrated for the share it took in the reformation at the middle of the sixteenth century, when there was issued from it, by the direction of Frederic III., elector palatine, a catechism or rule of faith, which till this day is in use in certain reformed continental churches.

From the market-place, in which St Peter's church is situated, a steep ascending alley leads to the castle, which occupies a prominent shoulder of the hill over the town, and encloses within its walls several acres of ground. The ruins, which are altogether of red sandstone, exhibit a bold and magnificent front, consisting of a central edifice, like a dwelling-house, with rows of windows on different floors, flanked at the eastern angle by a huge round tower, the corresponding tower at the other corner being gone, leaving a shattered gap as if it had been torn off by violence. The edifice, when entire in all its parts, was one of the largest feudal strongholds in Germany, and formed not only an almost impregnable fortress, but a splendid palace. The oldest part dates from the beginning of the fifteenth century, and the parts of a more modern erection, resembling what we call the Elizabethan style, were added in the sixteenth and seventeenth centuries by the electors palatine, who made the castle their chief place of residence. The palatinate, it is almost needless to remind the reader, was the quarter in "High Germanie" which formed, during the seventeenth century, a favourite battle-ground to the European powers, and Heidelberg, as the capital and tower of strength of the district, came in for more than an ordinary share of the horrors of military devastation. The town has been repeatedly bombarded, burnt, and pillaged, the last and greatest of the attacks upon it being in 1693, when the castle, on being taken by the French, was blown up and destroyed, and the inhabitants of the town were exposed to cruelties which are too horrible to describe. The castle was afterwards restored as a fitting residence for the court of the elector palatine, but was, in 1764,

struck by lightning, which, setting fire to the fabric, was the means of reducing it to its present condition.

After ascending by the long slanting path from the town, we reach the great vaulted entrance, and thence by a winding passage below the central building, attain the inner square of the castle. Here the exceeding elegance of the architecture strikes the eye, and our first sensation is a feeling of deep sorrow, to see so much beauty of design in the splendid roofless walls doomed to an irretrievable decay. The side of the quadrangle which forms the front of the castle, is in the best state of preservation; it contains the chapel, still in good order, and beneath are vaults of considerable extent, in one of which stands the celebrated tun of Heidelberg. After seeing the chapel, and the apartments which had at one time been occupied by the Princess Elizabeth, daughter of James I. of England, and wife of the elector palatine, we descended to the vault containing the tun. This huge cask, which occupies an entire cellar, is adjusted in a peculiar manner on its side, and the upper part is covered by a platform with a rail, to which visitors ascend by a stair. A trap-door in the platform may be called the bung to this monstrous vessel, and there exist means for drawing off the liquor at the end, as in an ordinary butt. According to the statement of the person who shows, and seems to be the guardian of the tun, it measures thirty-three feet in length by twenty-four in diameter, and can contain 283,000 bottles, or about 800 hogshheads. It was constructed by one of the former lords of Heidelberg, for the purpose of holding wine, and its size was intended to be emblematic of the overflowing abundance of the vintages in the beautiful country around. It has not been used since 1769, or shortly after the conflagration which rendered the castle desolate.

The view from the projecting bulwarks of the castle across the vale of the Neckar, although exceedingly grand, is inferior to that obtained from a projection of the hill above, whence the eye stretches over the extensive valley of the Upper Rhine, and is only interrupted by the Vosges mountains in France, waving along the western horizon. The extreme flatness of the land brings into view innumerable towns and villages scattered over the scene, the distant church towers seemingly growing out of a sea of verdure variegated with the yellow tints of autumn, while, winding through the beautiful landscape, the Rhine is seen at intervals glancing in the rays of the setting sun. We must, however, withdraw from the contemplation of this fair scene. The shadows of evening are deepening in the lovely valley of the Neckar below us, and we must descend to prepare for the fatigues of another day.

WEAPON-SCHAWING.

In the commencing chapter of *Old Mortality*, Sir Walter Scott has given an accurate and interesting description of one of the Weapon-Schawings of old Scotland, with all the formalities and sports thereupon attending. In every county or shire these local militia meetings, for such (it is scarcely necessary to say) was their character, took place annually, and received the name of Weapon-Showings, from the arms and accoutrements of the assembled force being then and there inspected by the sheriff of the district. There are two places in the county of Peebles, or Tweeddale, which still retain the respective names of King's-Muir and Sheriff-Muir, originally derived from their being the scene of these periodical musters. The King's-Muir is a level piece of ground, situated close by the town of Peebles, the capital of the shire; and the Sheriff-Muir, a spot of similar character about two miles to the west of the same ancient burgh. A roll of one of the musters on the King's-Muir is still extant, and the statements which it contains will give a better idea of the nature of this species of militia force, and of the appearance of those who composed it, than could be obtained in any other way. The preamble of the roll runs thus:—"At that part of the Barrow-Muir of Peebles, called the King's-Muir, in presence of James Nasmyth of Posso, sheriff-depute of the sheriffdom of Peebles, on the 15th day of June 1627, being the ordinary day and place appointed for the mustering and showing of weapons of the said sheriffdom, COMPEARED the barons and others underwritten, and gave in their musters and showing of weapons in manner following." Then begins the list of names.

"Walter Brown, in Wester Haprew, bailie to my Lord Yester, in his lordship's name, well horsed, with jack, plet sleeves, steel bonnet, pistol and sword, accompanied with threescore and five horsemen, and four footmen, all with lances and swords, dwelling on noble Lord Yester's lands, in the parishes of Peebles, Lyne, Stobo, and Drummelzier.

James Chisholm, in Glenholm, for my Lord Earl of Wigton, well horsed himself, accompanied with seven horsemen, with lances and swords, dwelling on the said noble Earl's lands, in the parish of Glenholm.

Sir Archibald Murray of Darnhall, well horsed, with a collet, accompanied with forty-two horsemen, with lances and swords, ten jacks and steel bonnets, within the parishes of Kilbucho and Eddleston."

These are specimens of the followings brought to the Weapon-Showing by the larger proprietors of the county, whose duty it was to appear with a body of men proportioned to the extent of their estates, and who, indeed, usually took a pride in thus exhibiting

their greatness. The roll presents the lesser personages commonly as follows:—

"John Sander of Foulage, present for Foulage and Melin's land, well horsed, with jack, plet sleeves, and steel bonnet, sword and lance; within the parish of Peebles.

Thomas Thomson, in Bonington, present, horsed, with lance and sword; parish of Peebles.

Robert Porteous, for Winkston, present, with a buff-coat, a pair of pistols and a rapier; within the parish of Peebles."

Even these brief extracts will show sufficiently that this Weapon-Show armament, which amounted in all to 294 horsemen and 10 footmen, must have been rather a motley one, as regarded weapons, dress, and other points. Some individuals even came without any arms whatever; as in the subjoined case:—"William Brown of Logan, present, well horsed, with lance and sword; and a horseman with nothing; parish of Glenholm." As regarded the nature and appearance of the horses, also, there would in all probability be a still greater degree of incongruity than in the case of dress or arms; some of the steeds being clean-limbed bits of blood from the stables of my lord, while others came rough from the farmer's plough. But, uncouth and strangely varied as the King's-Muir assemblage was in point of external appearance, there was a still more striking variety in the characters of the parties composing the troop, if we may believe Dr Alexander Penneucik, who was long a member of the corps, and who has described one of its meetings. Dr Penneucik, who was a gentleman of good family and estate in Peeblesshire, and practised besides as a physician in the county, is well known as the author of a *History of Tweeddale*, first printed and published in 1715. A number of poems were appended to the topographical work, and from one of these we shall make some extracts, which paint most humorously the militia corps of Tweeddale. The piece was written on occasion of Argyle's invasion in 1685. The whole militia of the country was ordered out, to be in readiness to oppose him, but his speedy capture and death rendered their term of service short and bloodless. In the following description of the troop, Dr Penneucik gives the parties introduced their territorial designations. "Drummellear" is Hay of Drummelzier (ancestor of the Hays of Dunse); "Stenhop" is Murray of Stanhope; "Hayston" Hay of Hayston (ancestor of the present Sir Adam Hay); and so on.

The merry month of May was in her pride,
And loyalty seem'd Scotland's lovely bride,
When bold Argyle, that lofty little man,
Through Neptune's regions with arm'd squadrons ran.
The royal trumpets sound, the drums do beat,
And troops march through the country soon and late:
The gentry rise in arms, in splendid manner,
And thrust in throats to brave Bellona's banner;
Crying, mount, march, charge, spur up your avers,*
And fight like Scotsmen under valiant Clavers.
Drummellear chosen was, for heart and hand,
The loyal Tweeddale blades for to command.
As is his due, we rank him first in place
For his rare charms of body, mind, and face.
Young Stenhop, our lieutenant, bravely can
Approve himself a stout and prudent man.
What shall I say of our three Brigadiers,
But that they are incapable of fears,
Of strength prodigious, and of looks so froward.
That every glower they give would fright a coward.
To view but Hairhop's great red Roman nose
Would fly a rebel's heart into his hose.
Strong are his bones; his looks they are so big,
That every word he speaks would kill a whig.
Kind Callins with his cut-lugst next appears,
The second of our warlike Brigadiers:
His arms like Sampson's, and with every leg
That might a rammer be to great Mons Meg.†

No cure nor comfort want we in its kind,
To give content to body or to mind:
For Doctor Penneucik is our physician,
And Kickmaleerie fiddler's our musician;
The Doctor's courage none, I think, dare doubt,
'Tis known he sheds more blood than all the troop.

After being in camp forty days, the poet proceeds to tell us, all the members of the loyal Tweeddale troop began to be heartily tired of their soldiering experiment.

Stout Kaillie claws his shoulders, and exclaims,
"Must I not clip my sheep, and spane my lambs?
I'll turn tail on Friday without failie,
In spite of all the troop, or deil tak Kaillie."
And yet for all this heat and fiery fury,
Good honest Kaillie to the last did tarry.

The result of the affair of course was, that the honest men were sent home to clip their sheep and spane their lambs, which operations even lairds or land-proprietors did not in those days disdain to conduct or superintend in person. In conclusion of this sketch of a militia troop of old times, we may observe, that the author of the poem from which extracts have now been given, is a personage not unworthy of a name among our Scottish poets and writers of the seventeenth century. He was an attentive observer of the rural manners of his district, and paints them, both in prose and verse, with much force and humour. He was held in great esteem among the gentry of Tweeddale, and seems himself to have been a rare specimen of the old Scottish gentleman and scholar.

* Horses. † A cut-lugged horse, or one nicked in the ears.
† A large cannon in Edinburgh Castle.

FANNON'S MARE,

A SKETCH FROM THE SOUTHERN STATES.

THE exploits of Fannon, the famous partisan of Randolph, would make a body of facts more interesting than any tale of fiction. He was a reckless fellow—bloody-minded as the hounds of Hayti. He sometimes slew the helpless and innocent in cold blood—the coward! But he had that instinctive tone and bearing of authority that kept his people within the metes and bounds of his own despotic will. He and his party were one day resting themselves by a spring; lounging here and there on the green grass in the shade of the trees. One of his subordinates, a big strong man, had got mad with him. His rage had been boiling in him for several days; and some fresh affront at the spring caused his anger to become ungovernable—he drew his sword and rushed at his captain, swearing he would kill him. Fannon had stretched his slight form on the sward, and was resting with his elbow on the ground and his hand under his head. His devoted followers were around him, and he heard the click of their locks as they cocked their rifles. "Let him alone!" cried Fannon, in his quick sharp tone. He lay still; calm and self-possessed, with his keen dark eyes fixed on the raging lieutenant, as he made a tremendous plunge at his breast. But when the stroke came, its object swerved away like a snake, and the baffled man plunged his sword into the ground. Quick as lightning Fannon's sharp blade passed through his gigantic frame—"Thus, and thus, I punish those who disregard my authority!" and his eyes glowed and sparkled like a serpent's. The man sank to the earth for ever.

But "Fannon's Mare" is written at the top of this sheet; and she is the heroine of this present writing. Achilles had his Xanthus and Balius, and Podargus; Alexander had his Bucephalus; McDonald had his Selim. Fannon was a man of blood like them, and like them he had his favourite and trusty charger; and Fannon's mare was worthy of her owner, or "even a better man." He called her the Red Doe, from her resemblance in colour to a deer. She was a rare animal—fleet, powerful, intelligent, docile as a lamb—and her owner valued her, I dare say, above king or country, or the life of his fellow man. She bore him proudly and fearlessly in the bloody skirmish or the quick retreat. When he stood in the noisy council of his partisans, or in the silent ambush, the faithful brute was by his side, ever ready to bear him whithersoever he would.

Down on the east of Little River the partisan and some four or five of his followers one day captured a man by the name of Hunter, a political opponent, from the country about Salisbury. This was sufficient cause of death, and Fannon told the man he should hang him. Hunter was evidently a man of the times; but what could he do, alone and defenceless, with a dozen bitter enemies! It was a case of complete desperation. The rope was ready, and a strong old oak threw out its convenient branches. Fannon told him he might pray, for his time was come! The poor man kneeled down, and seemed absorbed in his last petition to a throne of mercy. Fannon and his men stood by; and the trusty mare stood among them with the reins on her neck. They began to be impatient for their victim to close his devotional exercises. But they soon discovered there was more of earth than heaven in Hunter's thoughts; for he suddenly sprang on Fannon's mare, bowed his head down on her powerful neck, pressed his heels on her flanks, and darted away like the wind!

The rifles were levelled in a moment—"Shoot high! shoot high!" cried Fannon; "save my mare!" The slugs all whistled over Hunter's back, save one that told with unerring aim, which tore and battered his shoulder dreadfully. He reeled on the saddle and felt sick at heart; but hope was before him, death behind, and he nerved himself for the race. On he sped. Through woods and ravines and brambles did that powerful mare carry him, safely and swiftly. His enemies were in hot pursuit. They followed him by the trail of blood from his wounded shoulder. He came to Little River; there was no ford; the bank was high, and a deep place in the stream before him. But the foe came—he drew the rein and clapped his heels to her sides, and that gallant mare plunged recklessly into the stream. She snorted in the spray as she rose, pawed the yielding wave, arched her beautiful mane above the surface, and skimmed along like a wild swan. Hunter turned her down stream in the hope of evading his pursuers; and she reared and dashed through the flashing waters of the shoal, like lightning in the storm-cloud.

But Fannon was on the trail, and rushing down the bank with all the mad energy that the loss of his favourite could inspire. Hunter turned the mare to the opposite bank; it was steep—several feet of perpendicular rock—but she planted herself on the shore at a bound; and then away she flew over the interminable forest of pines, straight and swift as an arrow—that admirable mare!

On and on did the generous brute bear her master's foe, till the pursuers were left hopelessly behind. Late in the evening Hunter rode into Salisbury, had the slug extracted from his shoulder, and after lingering some time with the effects of his wound and excitement, finally got well. And that gallant mare, that had done him such good service, he kept and cherished till she died of old age.—From the Southern Citizen, quoted in the New-Yorker.

SONG OF PEACE.

BY ROBERT GILFILLAN.

Awake the song of peace—
Let nations join the strain;
The march of blood and pomp of war
We will not have again!
Let fruit-trees crown our fields,
And flowers our valleys fair;
And on our mountain steep—the songs
Of happy swains be there!
Our maidens shall rejoice,
And bid the timbrel sound;
Soft dreams no more shall broken be
With drums parading round.
No tears for lovers slain
From lovely eyes shall fall;
But music and the dance shall come
In halcyon joy to all!
The rider and his steed,
Their path of fame is o'er;
The trumpet and the trumpeter
Shall squadrons rouse no more!
No fields of victory won
With blade and battle-brand!
A nobler triumph shall be ours—
A bright and happy land!
Too long the man of blood
Hath ruled without control;
Nor widows' tears, nor orphans' sighs,
Could touch his iron soul!
But, lo! the mighty's fallen—
And from his lofty brow
The chaplet fades that circled there—
Where are his trophies now?
Look to the countless graves,
Where sleep the thousands slain!
The morning songs no more call forth
The stirring bands again!
The din, the strife is past
Of foe with falling foe—
The grassy leaves wave o'er their heads
And quiet they rest below!
Sound high the harp of song,
And raise the joyous strain;
But war's rough note be it no'er heard
To swell the chords again.
Put all its trappings past—
Vain pomp of bygone years—
To ploughshares grind the pointed swords,
To pruning-hooks the spears!
Come, man, to brother man,
Come in the bond of peace;
Then strife and war, with all their train
Of dark'ning woe, shall cease.
Come, with that spirit free,
That art and science give;
Come, with the patient mind for truth,
Seek it, and ye shall live!
Then earth shall yield her fruits—
The seasons forth shall bring,
And summer fair shall pour her sweets
Into the lap of spring!
While autumn, mellow, comes
With full and liberal hand,
And gladness then shall fill each heart
Through all the happy land.

WALPOLIANA.

[A second series of gleanings from the miscellany of pieces under that title by Horace Walpole.]

LORD WILLIAM POULET.

Lord William Poulet, though often chairman of committees of the House of Commons, was a great dunce, and could scarcely read. Being to read a bill for naturalising *Jemima*, Duchess of Kent, he called her, *Jeremiah*, Duchess of Kent.

Having heard south walls commended for ripening fruit, he showed all the four sides of his garden for south walls.

A gentleman, writing to desire a fine horse he had, offered him any equivalent. Lord William replied, that the horse was at his service, but he did not know what to do with an elephant.

A pamphlet, called "The Snake in the Grass," being reported (probably in joke) to be written by this Lord William Poulet, a gentleman abused in it sent him a challenge. Lord William professed his innocence, and that he was not the author; but the gentleman would not be satisfied without a denial under his hand. Lord William took a pen, and began, "This is to certify, that the buk called the Snake"—"Oh, my lord," said the person, "I am satisfied; your lordship has already convinced me you did not write the book."

HOURS OF COMPOSITION.

I wrote the "*Castle of Otranto*" in eight days, or rather eight nights; for my general hours of composition are from ten o'clock at night till two in the morning, when I am sure not to be disturbed by visitors. While I am writing, I take several cups of coffee.

APPLAUSE, THE NURSE OF GENIUS.

One quality I may safely arrogate to myself: I am not afraid to praise. Many are such timid judges of composition, that they hesitate, and wait for the public opinion. Show them a manuscript, though they highly approve it in their hearts, they are afraid to commit themselves by speaking out. Several excellent works have perished from this cause: a writer of real talents being often a mere sensitive plant with regard to his own productions. Some cavils of *Mason* (how inferior a poet and judge!) had almost induced *Gray* to destroy his two beautiful and sublime odes. We should not only praise, but hasten to praise.

AUTHORS AND ARTISTS.

I have always rather tried to escape the acquaintance and conversation of authors. An author, talking of his own works, or censuring those of others, is to me a dose

of ipecacuanha. I like only a few, who can, in company, forget their authorship, and remember plain sense.

The conversation of artists is still worse. Vanity and envy are the main ingredients. One detests vanity, because it shocks one's own vanity.

Had I listened to the censures of artists, there is not a good piece in my collection. One blames one part of a picture, another attacks another. Sir *Joshua* is one of the most candid; yet he blamed the stiff drapery of my *Henry VII.* in the state bed-chamber, as if good drapery could be expected in that age of painting.

CRITICISM.

It is prudent to consult others before one ventures on publication—but every single person is as liable to be erroneous as an author. An elderly man, as he gains experience, acquires prejudices too: nay, old age has generally two faults—it is too quick-sighted into the faults of the time being, and too blind to the faults that reigned in his youth; which having partaken of, or having admired, though injudiciously, he recollects with complaisance.

BON-MOTS.

I have made a collection of the witty sayings of *Charles II.* I have also a collection of bon-mots, by people who only said one witty thing in the whole course of their lives. *Charles II.* hearing a high character of a preacher in the country, attended one of his sermons. Expressing his dissatisfaction, one of the courtiers replied, that the preacher was applauded to the skies by his congregation. "Ay," observed the king, "I suppose his nonsense suits their nonsense."

CONTEMPORARY JUDGMENTS.

Contemporaries are tolerable judges of temporary merit, but often most erroneous in their estimate of lasting fame. *Burnet*, you know, speaks of "one *Prior*;" and *Whitlocke* of "one *Milton*, a blind man." *Burnet* and *Whitlocke* were men of reputation themselves. But what say you of *Heath*, the obscure chronicler of the civil wars? He says, "one *Milton*, since stricken with blindness," wrote against *Salmasius*; and composed "an impudent book, called *Iconoclastes*."

FACE-PAINTING.

Lady Coventry, the celebrated beauty, killed herself with painting. She bedaubed herself with white, so as to stop the perspiration. *Lady Mary Wortley Montagu* was more prudent: she went often into the hot bath, to scrape off the paint, which was almost as thick as plaster on a wall.

HEROISM OF A PEASANT.

The following generous action has always struck me extremely; there is somewhat even of sublime in it:—A great inundation having taken place in the north of Italy, owing to an excessive fall of snow in the Alps, followed by a speedy thaw, the river *Adige* carried off a bridge near *Verona*, except the middle part, on which was the house of the toll-gatherer, or porter, I forget which; and who, with his whole family, thus remained imprisoned by the waves, and in momentary danger of destruction. They were discovered from the banks, stretching forth their hands, screaming, and imploring succour, while fragments of this remaining arch were continually dropping into the water. In this extreme danger, a nobleman, who was present, a Count of *Pulverini*, held out a purse of one hundred sequins, as a reward to any adventurer who would take a boat, and deliver this unhappy family. But the risk was so great of being borne down by the rapidity of the stream, of being dashed against the fragment of the bridge, or of being crushed by the falling stones, that not one, in the vast number of spectators, had courage enough to attempt such an exploit. A peasant, passing along, was informed of the proposed reward. Immediately jumping into a boat, he by strength of oars gained the middle of the river, brought his boat under the pile, and the whole family safely descended by means of a rope. "Courage!" cried he, "now you are safe." By a still more strenuous effort, and great strength of arm, he brought the boat and family to shore. "Brave fellow," exclaimed the count, handing the purse to him, "here is the promised recompense." "I shall never expose my life for money," answered the peasant. "My labour is a sufficient livelihood for myself, my wife, and children. Give the purse to this poor family, who have lost all."

FEMALE QUARRELS.

A man of rank, hearing that two of his female relations had quarrelled, asked, "Did they call each other ugly?" "No." "Well, well, I shall soon reconcile them."

POISSARDES.

The *poissardes* or fish-women at *Paris*, form a sort of body-corporate. In the time of *Louis XIV.*, the Dauphin having recovered from a long illness, the fish-women deputed four of their troop to offer their congratulations. After some difficulties, the ladies were admitted by the king's special command, and conducted to the Dauphin's apartment. One of them began a sort of harangue, "What would have become of us if our dear Dauphin had died? We should have lost our all." The king meanwhile had entered behind, and being extremely jealous of his power and glory, frowned at this ill-judged compliment; when another of the deputation, with a ready wit, regained his good graces, by adding, "True, we should have lost our all—for our good king could never have survived his son, and would doubtless have died of grief." The neatness of this unexpected turn was much admired.

PREJUDICES.

Our passions and prejudices ever mislead us. There is a French bon-mot on this topic. A curate and his wife had heard that the moon was inhabited; a telescope was borrowed, and the lady had the first peep. "I see," said she, "I see two shades inclining towards each other; they are, beyond doubt, happy lovers." "Poh!" said the curate, looking in his turn, "these two shades are the two steeples of a cathedral."

PRICE THREE HALFPENCE.

A WEST INDIA SKETCH.

BY THE OLD SAILOR, AUTHOR OF "TOUGH YARNS," &c.

"A negro has a soul, an please your honour," said the corporal (doubtfully).

"I am not much versed, corporal," said my uncle Toby, "in things of that kind; but I suppose God would not leave him without one any more than thee or me." STRANK.

MAHAICA CREEK, although bearing so humble a designation, is in many parts half a mile in breadth; and after collecting the waters of several tributary streams, empties itself into the sea, between the fifth and sixth degrees of north latitude, on that part of the coast of South America formerly known as French, then Dutch, but now British Guiana. The planters on both shores of the creek take advantage of its aid to send their produce down to vessels that come to load at the entrance, or else ship it in colonial sloops, to be conveyed round to the river Demerara. The tide is extremely rapid, and at low water the channel is so narrow and shallow as to render it unnavigable for any vessels except those of very light draught; therefore great caution is required to catch the proper time to descend.

Most of the planters whose estates lie adjacent to the stream, are provided with handsome boats, rowing with from four to eight oars; and as the negroes are rather partial to such excursions, they make excellent boatmen, and vie with each other in the speed and appearances of their little craft, which generally have a raised roof abaft, to shelter passengers from the intense heat of the sun.

I was visiting my friend Mitchell (who managed a very large estate that the creek divided into two parts), and had expressed a great desire to inspect an Indian encampment, about forty miles up the Mahaica from the place of his residence, near the ferry that forms the line of communication between the east coast of Demerara and the colony of Berbice. It was indeed a most beautiful place in which the proprietor of that plantation had pitched his tent, and though on a perfect level, yet the best had been made of situation, by the disposing of the surrounding trees, with all their exquisite loveliness of colour in foliage, flower, and fruit, so as apparently to exclude that distant prospect which in reality did not exist. But the proprietor had made an ample fortune, and returned home to England, leaving Mitchell with a handsome salary, and privilege to act as his deputy; for, notwithstanding all the attractive splendour of nature, attired in her richest costume, notwithstanding the luxury of West India enjoyments, notwithstanding that hundreds of slaves were ready to the utmost extent of obedience to a beck or nod, there was one small winged insect—the mosquito—that did more to terrify and torture its victims than the royal tiger of Bengal, or the kingly lion of Southern Africa; and from that pestiferous little creature all are equally ready to flee.

The smoke-wreaths had been scarcely wafted away from the daybreak gun, when Mitchell aroused me to say that his boat was waiting for us at the ferry, and the morning delightfully cool. A cold bath, and a cup of delicious coffee and a roasted plantain whilst dressing, occupied only a few minutes, and by the time the sun had jumped up on to the verge of the horizon to see what the world was about, we were embarked and gallantly flying up the stream, propelled by six stout negroes, each in a glossy suit of nature's own tailoring; in fact, except the cloth round their loins, they were as naked as they were born.

The day before had been intensely hot, and the night till two in the morning had been extremely sultry, but the cold squishy chill that now made us tremble and shake, appertained more to the icy regions than to the torrid zone; but as the day advanced, the influences of the master spirit prevailed, and a more genial warmth diffused itself. We had also a breeze soon after starting, and the men laid on their oars and spread the canvass; and as we glided smoothly along, I must own

that the beauty of the river scenery was delightful to the eye, especially as there was nothing on either hand in the distance to draw the attention away from objects immediately in the vicinity; in truth, the sight on both sides was bounded by the towering trees upon the banks of the stream, except where a break opened to a plantation residence, and in one or two places a space had been cleared, and sugar-houses erected.

As we proceeded higher up, the creek became more narrow, and as the lofty trees prevented the wind from reaching our sail, it was consequently lowered, and the negroes once more took to their oars: the ever green foliage in all its variety of shade; the splendid plumage of the birds, as they flashed to and fro in the sun; the long pennons of crimson flowers that waved on high from the branches; the delicious scent of the orange blossom—all grew into greater luxuriance, whilst the only sounds that disturbed the stillness which would otherwise have prevailed, was the voice of the whip-poor-will, whose notes here became "who—who are you?" the scream of the parrot or parrotet, and the ever-changing tones of the mocking-bird.

Suddenly, on a signal from their spokesman, the negroes struck up a song, to which they kept time with their oars. The leading songster sang a line solo, taking up any occurrence that crossed his mind at the moment, or that took place in our progress. Thus, when the looms of the oars were thrown aft to replunge the blade in the water, the leader sang his line, whatever it might be, and as they one and all took their stroke together, every voice united in a general chorus. The first subject was connected with our voyage. The leader commenced—

We da boy for pull da boat,
to which the rest instantly rejoined—
Sing cheery row!

then the first line was repeated, and the response again followed; and it was extremely rare that a subject was alluded to more than once; indeed, as the scenery and circumstances were changing, he was seldom at a loss for a theme; and when it flagged, some sly hit at the manager, myself, or their fellow-negroes, supplied the deficiency. There was something extremely musical in the tone and manner of singing, that rendered it any thing but unpleasant; and as it acted upon the energies of the negroes, to incite them to greater exertion, we had no objection to it. Two or three other lines I remember were—

Sun him get abud da bush,
Sing cheery row;
Sun him get abud da bush,
Sing cheery row.
Captain hab da grog-bottell,
Sing cheery row;
Captain hab da grog-bottell,
Sing cheery row.

At one time the voice of the leader became low and solemn as he pronounced—

Poor Charley neber cum again,
Nigger boy cry oh!
Poor Charley neber cum again,
Nigger boy cry oh!

There was something exceedingly plaintive in the tone of the leader, as well as the response, and Mitchell informed me that they referred to the death of a favourite slave belonging to his plantation, who had been drowned at that very spot about twelve months previous. The motion of the oars was equally slow with the utterance of the singer, and several other allusions to the deceased were made in the same mournful strain, till all at once the leader shouted—

Alligator in da mud,
Sing cheery row;
Alligator in da mud,
Sing cheery row.

And true enough my friend pointed out to me, at a few yards' distance, what appeared to be part of the trunk of an old tree, but its motion and its glistening

eyes soon betrayed its real character, and with a noise something between a heavy sigh and a groan, the creature slid into the water, and disappeared.

"There was a rather melancholy story about poor Charley," said Mitchell; "but as you have not yet breakfasted, you would perhaps prefer waiting till you have, before I narrate it."

"It would perhaps be more unpleasant for you to tell than for me to hear," answered I, "as you must be somewhat exhausted; therefore I will not tax your breath."

"You speak merely from your own experience, my friend," said he; "I am so well insured to the climate, that it has become perfectly natural to me; and, therefore, as there is no time like the time present, you shall have the narrative at once:—Poor Charley was one of the finest and best domestic slaves in the colony, always ready when wanted, and willing to perform his duties with perfect good humour; but there were times when the blood of the white man that ran in his veins would stir his pride; for, though holding so inferior a station, he was in fact the son of a man of rank, title, and distinction, who held one of the highest offices in Demerara. His mother was a domestic in the establishment of Sir Richard, and I have heard, for I never saw her, that she was a remarkably well-made woman; and as negroes are extremely fond of showing off their figure to the best advantage, it may naturally be supposed that Celia was not a little proud in displaying her handsome person; indeed, but for her colour, she might have been considered a beauty. At all events, she attracted the notice of the baronet, who carried her with him to England. There, however, her heart sickened at the indignities which were heaped upon her on account of her colour; and as she pined for her kindred and her home, she was sent back to the colony, with a handsome sum of money, and promises of emancipation. The vessel quitted England, but whatever were Sir Richard's good intentions, or whether the fault was his or not, no instructions were forwarded to procure the poor girl's freedom; and when she landed in George Town, she was immediately claimed for the estate, and was once more a slave. Still implicitly relying on the promise of her master, she submitted to her hard fate, and looked forward with eagerness for the period to arrive when she should obtain her papers, and her child be born free. The money she had received (together with other valuables) was placed in the manager's hands for security, and she pleased herself in airy speculations as to its appropriation.

Several months passed away; her time for delivery drew near, and still no instructions arrived. It is true the labour imposed upon her was but nominal: she did pretty well what she pleased; but, somehow or other, after negroes have breathed the air of England, they return with strange notions of liberty and freedom! Celia keenly felt the disappointments, as vessel after vessel arrived without the promised letters, till at length intelligence came that Sir Richard had lost his life in a duel he had provoked; the estates had passed into the hands of the next of kin, and Celia was yet a slave. Rage, grief, and vexation, brought on premature labour, and the unhappy girl, after bringing forth a fine boy, which she attempted to destroy, was found by the nurse, after an absence of only a few minutes, a lifeless corpse. Intelligence of the circumstance, together with a full statement of particulars, were sent to the new proprietor, who was a needy and avaricious man. He knew nothing, and would know nothing, of Celia or her infant; but as the property was no more, and a slave by law cannot hold property, he directed that the money deposited by the poor girl in the hands of the manager should be placed to his own account and uses. Thus was Charley ushered into the world a helpless orphan slave; but the manager was a humane and generous-minded man: he kept the child in the house with every care as if it had been his own; no menial

occupation was ever allotted to him; he gave considerable promise of quickness of intellect, and by stealth one of the overseers taught him to read and write. As he grew older, his history was unfolded to him, and he felt a conscious superiority over his fellows. In time he became strongly attached to a young Creole upon a neighbouring estate, who was somewhat similarly situated with himself; for she was also a slave, though both her parents were yet living. Charley was well aware that the freedom he enjoyed was held by a very frail tenure—the change of a proprietor or a manager might consign him to labour in the field, for it rested solely on the caprice of his owner or his agents. Andrews was, as I have already said, a worthy soul, and at his own personal risk and expense he availed himself of an opportunity of sending the youth to England.

Heavy and sad was Charley's parting with Sophia, for both their natures had been polished by instruction, and their attachment was pure and ardent; but the object Charley had in view embraced the future prospects of both, namely, emancipation from slavery; and though they were well aware that the negro taint would exclude them from the society of white people, yet, if free, with the restoration of his mother's money, they could maintain themselves and be happy in each other's society. Thus they softened the affliction of separation, and, sanguine in their expectations, they did not contemplate a disappointment. But unhappily it came; for although Charley succeeded in behalf of Sophia, yet his own proprietor peremptorily refused his request for freedom, or a restitution of that which had been so unjustly taken from him. But the owner being about to dispose of the estate, Charley was of too much value to be allowed to remain in England, and the laws would not sanction his removal by force. Duplicity was therefore called into operation; inducements were held out, and fair promises made, which, coupled with the young man's earnest desire to bear good news to Sophia, prevailed upon him to embark for Demerara; but the very same vessel brought out a transfer of the property to other hands, and Charley, on his landing, discovered that he had been very cruelly betrayed. It certainly was a villainous transaction, for at the very moment that the promises of emancipation were making, the individual who promised had sold the young man with the estate. Andrews was superseded in his management, and a harsher man appointed; but, through the intervention of some influential gentlemen in the colony, Charley was disposed of and purchased by my principal, who placed him as a sort of clerk and butler over the household. The papers to emancipate Sophia had been forwarded by the young man, who could not now aspire to an union with a free woman, and her means were not adequate to buy his liberation; but the devoted girl determined to toil with unceasing industry to effect such purpose, whilst I endeavoured to promote their views by the means within my power. His trip to England had given Charley more exalted views of human nature than could be afforded by a slave colony. He had been a free man, had mixed unrestrainedly with the whites, and received many a hearty welcome. It is true he discerned that one man in England did more work than any three negroes, and that extreme wretchedness and distress, such as the West Indies never witnessed, was prevalent amongst the poor; but he likewise enjoyed that liberty which is congenial to the home soil of my native land, and he doubly felt the degradation of being again a slave. Still the amiability of his disposition, and his constant readiness to oblige, endeared him to every one; and, jealous as the negroes are of favouritism, they nevertheless made every exception as far as Charley was concerned, and were themselves amongst the first to do him honour. At length our proprietor sailed for home, and I was left in sole management, with permission to free the poor fellow as soon as his purchase-money could be raised. By dint of perseverance on the part of Sophia, and some small sacrifice on mine, the required amount was forthcoming; and as it was thought best to do the thing quietly, so as not to make any unpleasant impression on the other slaves, I sanctioned Charley's visit to George Town to take up his freedom. Never shall I forget the mingling emotions which prompted the poor fellow's expressions when he received his papers, and was declared a free man. There were anxious doubts as regarded the future; regret at parting with those whose kindness he had experienced; and joy, irrepressible joy, that there was no longer a barrier between him and Sophia. But, above all, there was a deep utterance of fervent gratitude to providence for its merciful interference in his favour. Confound the fellow, the remembrance makes a child of me!"

Mitchell's voice faltered, and there was a moisture in his eyes as vivid retrospection came over his mind; and during his recital I could not help being struck with the fact, that long habit and prejudice struggled against the operations of a kindly disposition; and the latter frequently caused him to controvert his arguments in favour of the former. The boatmen could hear very little if any thing of our conversation; but seeing us earnestly engaged, they ceased their chaunt, for they guessed poor Charley's history was the theme: still they narrowly watched our looks, and spoke in an under tone to each other; and when my friend could no longer repress his feelings, the spokesman suddenly burst forth in a loud song that was really startling, on

account of the previous stillness, though it expressed the honest sentiments of the negroes' hearts—

Massa Mitchell berry good man,
Sing cheerly row;
Massa Mitchell berry good man,
Sing cheerly row.

The heart-expressed animation with which this was sung, was evidently pleasing to the manager, who looked at me with a smile, as much as to say, "You see the fellows are happy enough," and I returned it with another, to express my gratification; at the same time I felt more assured than ever, that men who are capable of evincing strong feelings of a grateful nature, were not exactly of the class of those who should be kept in bondage. In a minute or two my friend waved his hand for silence, and proceeded.

"Well, Charley was at length a free man, and every thing being settled to his perfect satisfaction, we returned to the plantation; and as Sophia was then located upon an estate well up the creek, he insisted upon starting at once, to be himself the bearer of the glad intelligence. He should have had the boat, but the water had fallen very considerably, and he could not brook a delay of four or five hours. Away he went; and next morning, feeling a desire to witness the happiness of the attached couple, I manned the boat and rowed up; but having my attention attracted to an alligator that was dragging a body down the mud bank, at the place the chaunt of the men pointed out, we drove the creature away, and to my great horror and amazement discovered that his prey was no other than the lifeless remains of poor Charley. How he lost his existence, will probably remain amongst those mysteries which cannot be solved. At first it was conjectured that he had perished in attempting to wade across, but there was great improbability in this, as he was an excellent swimmer; then again his drowning was attributed to alligators, which are here pretty numerous, though small; but there were some who did not scruple to say that he had been murdered by a disappointed rival—for there *was* a rival in the case—but nothing certain was ever ascertained. As to Sophia, the unfortunate girl could not sustain the heavy affliction, and in less than a month she was laid in the same grave with her lover. Now you have had poor Charley's story, and I must look out for some place where we may get a feed."

"And a most melancholy story it is," said I. "Poor fellow, he deserved a better fate. But as for a breakfast, where will you find a house of entertainment in this wilderness?"

"Every plantation we come to has a resident, and any one of them would give us a hearty welcome," returned he. "We have no hotels or inns here—hospitality without money and without price if you like to stop for a week. But I cannot make up my mind as to whom we shall quarter ourselves upon. About two miles higher up is old Johnny Maclean, the burgher captain of the district, an honest hearty old fellow that has been twenty years at sea before he squatted down in his present place. Then there's Squire Aubrey, precise and particular, every thing in grand style, and like clockwork. Next, we should find Macarthy, as free, and as generous, and as glorious in his living, as a prince. Which do you prefer?"

"I must leave it entirely in your hands," said I; "but if possible pick out some interesting character."

"It shall be so," said Mitchell, looking out ahead upon the left bank of the river, where the varied green of the foliage and the bright hues of the flowers were delightfully blended together, and giving the boat a sheer in shore; "we will stop at Hammerton's."

I was going to inquire who Hammerton was, but the question was delayed by the peculiar mournful cadences of the negroes as they continued their chaunt. Their voices sank yet lower, as the leader, having looked towards a clump of plantain and papaw trees, uttered,

Old man tan upon da shore,
Sing saafly row;
Old man tan upon da shore,
Sing saafly row.

"Hush, Sam—hush!" said Mitchell; "leave off your song: he is indeed there, bending over the grave of his child."

"Massa Hammerton like for hearce we peak too much sorry," answered Sam, the leader of the chaunt.

"And who is Hammerton?" asked I, as Mitchell gave the boat a sheer in to a sort of jetty that ran out into the stream, and the next minute her nose was fast upon the shore. Mitchell did not answer my question, but pointed to the clump of trees before mentioned, beneath which I perceived a small marble monumental urn, and bending over it, with one hand resting on the top, was an elderly man, who, on our landing, immediately quitted the spot of his apparent meditation, and came towards us: he was tall, and when at his full height, in the days of strength, had measured six feet three inches in altitude. At that time he must have been a perfect giant in the muscular power of his frame; but now grief and age, like the storms and ice of winter to the foliage, had shorn him of those attributes for which he had once been so much admired. His arms were of more than ordinary length in proportion even to his vast body, and his hands were of such dimensions as to excite astonishment at their size. His dress was a mixture of court fashion and shabby genteel, with an enormous broad-brimmed hat that completely shaded his features; but when he removed it on our approach, with the most perfect gentlemanly ease, I could perceive that time and sorrow

had ploughed deep furrows on a countenance that indexed a benevolence of heart. His welcome was cordial, and given with a politeness of manner that marked him as one well acquainted with all the courtesies and accomplishments of polished society; yet there was a singularity in every thing that he did, which plainly manifested he was no servile imitator of other men, but a perfect original in himself.

"You have come to breakfast with me, I hope, Mr Mitchell," said he, after I had been formally introduced. "Your friend, you say, is desirous of seeing all that the colony can present to the view; I shall be proud to show him my plants."

Of course I expressed my thanks, and we walked towards the house, through grounds laid out very differently to any that I had yet seen: the soil was kept perfectly clean, and there was great order and regularity, whilst the shrubs had more the appearance of an experimental nursery than a plantation for immediate profit. There was the bread-fruit tree, carefully planted out; various kinds of almond-trees; the cocco-tree, with its large green bulbs; the shaddock; and numerous others.

The house, like its master, was falling into decay, and the interior was in a very ruinous condition, though there yet remained several traces of former comfort, and in some detached parts even of elegance. It was entirely on a ground floor, with a lofty roof resembling the bungaloes of the East; but the winds of heaven played through between the rafters, and in the wet season the rain took the same course, so that a dry corner was indeed a blessing; but as the showers were few and far between—sometimes four or five months—the inconvenience was not much felt.

The exterior situation of the house was such as fancy may picture, but which neither the pencil of the artist nor the pen of the writer could adequately describe. There was the garden in front, with its eternal summer of beauty stretching down to the river, whilst on each flank the tall mora, piercing a hundred feet into the air, raised its proud head, adorned with streamers of bright red flowers that wreathed its brows; the parasite, that drew its nourishment from the tree, sapped its vitality, and smiled in gorgeous array whilst it inflicted death. From the branches hung the curious nests of the mocking-birds, waving to and fro in every breeze, whilst creatures of the most lovely plumage hovered amongst the leaves, mingling all the colours of the rainbow. Flights of parrots in their variegated hues—flocks of the scarlet as well as the white flamingo—hundreds of birds about the size of a thrush, with rich jet glossy black wings, body, and tail, but the head and small portion of the breast of a deep crimson; there, too, was the little humming-bird, glistering and glancing like detached sun-beams hovering round the flowers, and then darting away with the rapidity of lightning; it was indeed a sweet, a heavenly spot for solitude, with the clear blue sky above, and the choicest of nature's productions below.

The back of the dwelling was also a garden in the form of an immense amphitheatre, the area of which was preserved by the towering trees; here were pine-apples in exquisite profusion, and all the delicious tropical fruits in greater perfection than I had ever seen them before; in fact, the proprietor employed his whole time in experimentalising on the productions of the earth, under the ardent hope of rendering future benefits to his fellow-creatures.

Our breakfast was a usual one in the West Indies, as far as materials went, but nothing could be whiter than the cloth that was spread over the table, and the massive old-fashioned plate, and the costly service of china displayed without ostentation—as the common utensils in constant use contrasted strangely with the extreme wretchedness of the great room—whilst the warm breeze, laden with the perfumes of the orange blossoms, and the mellifluous fragrance of ripe pines, came through the open windows, almost overpowering the sense.

The conversation was on general topics, and I found Mr Hammerton the finished gentleman in politeness of demeanour, the scholar, the man of science, well versed in literature and classical lore, a human monarch of nature's own creation, on whom a diadem could have conferred no additional honour, a philosopher and a Christian. Such were the ideas which two hours' intercourse with this remarkable man forced upon my mind, and my desire momentarily increased to ascertain something of his history; for, notwithstanding all that I have endeavoured to describe him, there was at times a wildness in his manner, and a fierce gleaming in his eyes, that seemed to be nearly allied to a derangement of intellect.

At parting, I very candidly and warmly expressed the gratification I had enjoyed during my visit; nor could I forbear from hinting my surprise that so much seeming intelligence and worth should be thus buried in the wilderness. Never shall I forget the look he gave me; what its meaning was, I could not then well divine. We were standing near the jetty, and only a few feet from the clump of trees, beneath whose shade was that monumental urn; his eyes flashed with fierceness; his long arms were extended at full length, and his large hands spread as if to repulse me with horror; whilst his tall body swayed to and fro with agitation, and a succession of heavy groans seemed to rend his very heart: thus he stood for more than a minute; then suddenly turning round, he strode amongst the trees, and fell prostrate, or nearly so, with his arms encompassing the tomb.

"We must render him assistance, Mitchell," said I,

although I undisguisedly own that the circumstance had produced an impression of alarm.

"No, massa—nebber!" responded an aged negro, who had followed us from the house; "let him a be spose you please; he for come better, by littlee minute when you all gone. He for taalk too much dis morning; make him tink sorry for noder time long ago."

"You are right, Cesar," observed Mitchell; "but look well after him, boy; I was in hopes he had quite recovered from these attacks."

"My massa for good deal much better," said Cesar, "but da tranger dere," pointing at me with his chin, "he hab face all same; palaver all same as da poor picanniny em bury in de bush." The fallen man moved. "Go, massa, go," continued the negro; "you no top longer; Golamity bless Massa Mitchell; go den quick, and no let em boys sing em chant hearee, spose you please."

We hastily embarked, and the boatmen, who had witnessed the scene, were too eager to get away from the place to require any orders to stretch out; they bent manfully to the oars, and in a few minutes we swept round a point of land that entirely separated us from the spot. I eagerly inquired of Mitchell the meaning of the strange and remarkable incidents which I had witnessed. He gave me a brief outline of Hamerton's history, that only served to prompt my curiosity, and induce me subsequently to collect all the information I possibly could, and which shall, in my next paper, be presented to the reader.

THE FORTUNES OF M. OUVARD, THE CONTRACTOR.

It is not the least striking circumstance connected with the French Revolution, that, while the more generous natures were eagerly perilling life in behalf of the political views they respectively entertained, or in defence of the national frontiers, there was a set of acquisitive natures, which recognised nothing in that great struggle, but a means of more rapidly successful money-making. While Danton, Desmoulins, Carnot, and their associates, had their attention concentrated on the hall of the Convention in the Tuilleries—while the nation was in a state of bankruptcy and starvation, and the armies were provided with no requisites but the resolution to die, if necessary, in defence of their country—the Exchange was the haunt of a tribe of men who might be described as trading on the miseries of their fellow-creatures, and getting rich on their impoverishment. Many of these persons suffered in the confusion, but others survived with the fortunes they had acquired. One of the most remarkable of them was a certain M. Ouvrard, who afterwards became eminent as a contractor for the armies under Napoleon and the restored Bourbons. This person published his life a few years ago, and from a copious review of that work, which has come under our attention, we obtain the following curious particulars:—

He was the son of an extensive proprietor of paper-mills on the borders of Bretagne and Poitou. At the breaking out of the Revolution, when as yet but twenty years of age, he had the sagacity to perceive that a greatly increased demand for paper must be one of the certain consequences of the era of political contention on which the nation was entering; and he therefore commenced his career by buying up the product of a number of paper-manufactories for the ensuing two years. An immense profit was the reward of this speculation, and he then removed to Paris, where for some years he moved in the first revolutionary circles. Bonaparte was of the number of his acquaintance, and of him he tells a curious anecdote:—A certain decree of the Committee of Public Safety allowed "cloth sufficient to make a uniform" to every officer in "active service." Bonaparte, among others, applied for his share of this distribution, but was refused by the issuing commissary, upon the ground that his brigade was not actually in the advance. On this he went to Madame Tallien, who gave him a letter of recommendation to the authorities concerned; and, thus armed, the man who was to sway the destinies of Europe made a second application, and actually obtained cloth to make himself the *habit, et culotte d'uniforme*. It is to be remembered, in connection with the anecdote, that there was at this time a miserable deficiency of all the necessaries and conveniences of life in Paris, so that the anxiety of Bonaparte to obtain a suit of clothes might not altogether be in consequence of his poverty as an individual. By the time that the Directory was established, Ouvrard had amassed great wealth, and was thus enabled to trust the new government to the extent of ten millions of francs. He was interested, of course, in the existence of the Directory, and had no good will to the usurping views with which Bonaparte returned from Egypt. But nothing could arrest the fall of this body. On the celebrated 18th Brumaire, when it ceased to exist, Ouvrard breakfasted with Barras, the leading director. A table was laid for thirty guests, for usually there were not fewer; but on this morning, the covers had no guests before them.

Ouvrard and Barras were sitting alone, in no very happy mood, when Talleyrand came in to demand the resignation of the latter, which was instantly complied with. A few days afterwards, Bonaparte applied to Ouvrard for a loan of twelve millions of francs, on behalf of the state. Instead of complying, he made inquiry respecting his previous loan of ten millions to the Directory. The consequence was, that he was mulcted of part of what he considered his due upon that loan, and arrested for alleged misconduct in respect to his contracts for the service of the marine. In the course of the legal proceedings against him, the amount of his vast wealth came to be discovered. It exceeded twenty-nine millions of francs, upwards of one million two hundred thousand pounds of English money. While a notorious money-gatherer, he was the reverse of sordid in his personal habits. At his seat at Raincy, he kept open house, whether he might be present or not, and gave the most splendid entertainments. Here he was visited by some of the most important personages of the day; among the rest, by Lord Erskine and Mr Fox, during the short peace of 1802. The persecutions instituted and kept up against him by the Bonaparte government, did not preclude his entering into large transactions with him. In the year 1800, he took the contract for provisioning the army by which the power of Austria was broken on the plains of Marengo. In 1802, when there was a scarcity of corn, he contracted with the government for the importation of a large quantity. In 1803, he took the marine contracts again (the old ones being still unsettled) for a fresh term of six years. In the next year, he contracted for a very considerable loan; and presently afterwards, in despite of all differences, he was sent to Madrid by Bonaparte, to negotiate the payment of the Spanish subsidy of sixty-two millions of francs to France.

Getting money from the treasury of Spain was a hard task to set an ambassador about; and the first reply of the Spanish minister to the suggestion deserves to be quoted, as a formula in the way of getting rid of such applications. "*Monsieur, nous avons la meilleure volonté, mais pas un ecu!*"—(My friend, we have the best inclinations, but not a coin.) M. Ouvrard, however, whose mind was always on the watch for opportunities of realising wealth on a large scale, resolved to do some business in the country on his own account. He undertook an immense importation of wheat in a time of dearth, projected loans, canals and other public works, and at one time seemed as if he had a great mind to purchase Spain out and out. Something approaching very near to this was actually done by our speculator. He contracted to furnish all the naval and military requisites of the state for a term of years, and made a bargain with the king, Charles IV., for the whole trade of his colonies in South America, the profits to be divided between his most Catholic majesty and the contractor. Upon this project, which Ouvrard speaks of in his Memoirs as an "*acte sans exemple*," "the greatest commercial and political enterprise which had ever been conceived or attempted," Napoleon put an extinguisher in the shape of an imperial decree. In its defence, the projector says that it might have stimulated the energies of Spain, and enabled it in some measure to meet the demand made upon it by the French government. But Bonaparte had a bad opinion of all contractors, whom he considered as only a kind of plunderers, and, being incensed at the scheme of Ouvrard, he caused him to be arrested, and placed in the St Pelagie. From this period, 1809, our speculator continued to spend his time chiefly in prison for several years, but did not lose any part of his enormous wealth, nor was his power to conduct great transactions diminished. Bonaparte, and his government, while heartily detesting him, knew his value, and could not altogether dispense with him. He was therefore allowed a little liberty on several occasions. In the beginning of the year 1812, there being some difficulty as to the supplies of provisions in Paris, the Baron Pasquier, then Prefect of Police, came to him in jail to take his opinion on the subject; and immediately afterwards, from the same place, he addressed a memorial to the emperor on the subject of furnishing subsistence for the army in the projected campaign in Russia, offering, upon certain conditions, himself to undertake the service. In this paper he clearly predicted the evil consequences which would arise from Napoleon's plan of "making the war support the war;" that is, taking free provisions every where. Ouvrard knew that provisions, under such circumstances, would become too scarce to allow of the army moving. In some interviews he had with Bonaparte, while still a prisoner, he endeavoured to enforce this truth, but without effect. In October 1813, the Duke of Rovigo (Savary) came to Ouvrard in the St Pelagie, and offered him his liberty on condition that he would construct a new plan of finance. He rejected the offer, and was soon after liberated in consequence of the advance of the allies.

Money is no bigot to particular shades of opinion, or to particular dynasties. As soon as the Bourbons had settled themselves anew in France, Ouvrard proposed to them a scheme of finance, which they were favourably listening to, when Bonaparte returned. The first thoughts of the restored emperor turned to the wealthy man whom he had left a prisoner in St Pelagie. Ouvrard agreed to produce 50,000,000 of francs against a given quantity of new *rentes*. How far this transaction had proceeded when the battle of Waterloo took place, we are not aware; but on the return of the discomfited emperor to Paris, when he found it necessary to abdicate and quit the French territory, he applied to

Ouvrard for a loan of a personal nature, requesting the advance of a large sum in South American securities, for which he proposed to engage his personal demesnes and those of his family. Ouvrard instinctively felt the insecurity of this pledge, and declined the loan. He even refused to take charge of a number of chests which the fallen emperor wished to leave in safe custody. In all this there was certainly no failure of gratitude in our speculator, for Bonaparte had never treated him in any other way than as a wretch whom it might be occasionally convenient to make use of, and whom to imprison, to "squeeze," and to load with opprobrious epithets, was, he thought, nothing more than fair.

Having got safely through all the turmoils of this period, Ouvrard lived to be of important service to the Bourbons. For several years he was the chief negotiator of all their government loans—in short, the Rothschild of France. When the French army proceeded under the Duke d'Angoulême to put down the constitutional government in Spain, a sad lack of foresight was manifested in the furnishing department. Ouvrard, no doubt aware of the state of the army in this respect, contrived to be by chance at Bayonne at the moment when it was about to cross the Bidassoa. All was in confusion. There were no rations, no forage, no magazines, no means of transport. It seemed as if three months would be necessary to furnish the proper stores. Strictly speaking, there was wheat for ten days, but no mills or sieves to make it into flour—no ovens, no bakers. The artillery had neither horses nor drivers. No dilemma could have been more suitable as an opportunity for M. Ouvrard showing his talents. Accordingly, on the very day after his arrival at Bayonne, the Duke d'Angoulême sent for him, and offered him the entire contract for all the services of the advancing army; he accepted it, relying (as he says) entirely upon the force of money to raise supplies even in an enemy's country; and the detail of the measures which he took to that effect shall be given as nearly as possible in his own words.

On the first signature of this contract, orders were given for the army to pass the Bidassoa; but M. Ouvrard's supplies were not to commence until four days after. "On the first day, the troops lived as they could—which was not without some trouble; and the arrangements of the government agents gave but an unsatisfactory idea of their talents; and uncassiness began already to show itself in the army. On the second day, no one disguised his suspicions. General Terlet found it almost impossible to procure forage for the few artillery horses that he had; the soldiers spoke openly in their bivouacs of the ill appearance of affairs; and the old troops, who had served in the Peninsula before, said plainly, 'Thus Spain always has been our destruction, and always will be! Here, we are but a day in the enemy's country, and already there are no provisions.'

By this time we were at Tolosa—on the next day my contract and supply was to commence. The Military Council assembled; I was sent for, and interrogated, 'Where are your magazines—what are your resources?' 'To-morrow the army will receive its regular issues.' 'We must have ten days' provisions at once for the second corps.' 'To-morrow the second corps shall receive ten days' provisions.' 'Well, but we want more than these mere promises. Your magazines—your dépôts—where are they?' I refused to answer, because I knew that my views would not have been credited. The Council adjourned; met again; adjourned again; and again met.

I had called together (this is in Tolosa) all the authorities; the priests, the merchants, all the persons of every description who had any credit, any influence. 'Gentlemen,' I said, 'the army is here: it does not desire to live at your expense: but you will feel that it must be fed: assist me in procuring provisions for the troops to-day, that they may not take your own out of your mouths to-morrow. We want bread, meat, vegetables, forage, horses, carriages. You know your country and its resources; away with you, therefore, into the neighbourhood, and inform your relations, your friends, every body you see, of this. Every thing that is brought I will pay for in ready money. I will do more; for every thing that is brought to me before eight o'clock to-morrow morning, I will pay ten times its value; nine times the worth for all that comes before nine o'clock; eight times for all that comes before ten; and so following. Now, here is money in advance for all! Away, and lose no time about the business.'

You may always rely, that men will be true to their own interest. By sun-rise next morning, the tops of the hills were covered by people of all sexes and ages, each hurrying before the other, to get the reward of the highest price. An event took place which I had not prepared for. The soldiers, uneasy about their supply, fell upon this crowd before it reached my stores, and pillaged it in an instant. Every thing was gone! The peasants came running to me. 'Monsieur, I had arrived before eight o'clock; they have plundered me of my goods!' 'How much were they worth?' 'So much.' 'Here is the money; go away, and bring more: when you come again, you shall not be plundered.' In short, the army had its full supply. It cost me dear, this system, in the first instance; but that we paid for every thing, and paid well, was soon known. Commodities then came in from all quarters; and when the supply became abundant, the prices fell accordingly."

This single transaction may give some idea of the penetration and ingenuity of Ouvrard, and will pro-

bably impress the conviction that, after all, his enormous wealth could not be altogether undeserved. His life—we are not aware whether it be yet concluded—affords a remarkable proof of the influence which money must always exercise in human affairs, and of the importance which it never fails to confer on those who possess it in large quantities. Ouyard was treated almost as a felon by Bonaparte; yet, even while thus regarded, his wealth brought not only the emperor's first ministers, but the emperor himself, to seek his counsel and assistance. He affords, at the same time, a proof that money may be possessed in unparalleled quantities, and that all this importance may be attached to its possessor, and yet the owner of it may not enjoy so much respect as is attached to many a poor man.

GREAT CAVE OF GUACHARO.

AMONGST the many subterranean recesses which are met with in different parts of the world, few are more remarkable, and none less known generally, than the Cave of Guacharo, in the republic of Venezuela, in South America. Indeed, until Humboldt published his masterly delineation of this quarter of the globe, Europeans were ignorant of its existence, although it had been long known to the Spanish missionaries, and was for generations a place of awe and terror to the natives. It is situated near the picturesque and delightful valley of Caripe, which lies to the west of the Gulf of Paria, in about ten degrees of north latitude. In a country where a love of the marvellous is a prominent feature of the mental character, a cavern whose unexplored recesses give birth to a river, and which is inhabited by myriads of nocturnal birds, whose terrible cries awaken all the echoes of the dreary subterranean, is of course a never-failing subject of conversation, and the attention of Humboldt was very soon drawn to it. He thus describes his visit to the cave:—

“At the foot of the lofty mountain of Guacharo, we were only four hundred steps from the cavern, without yet perceiving the entrance. The torrent runs in a crevice, which has been hollowed out by the waters; and we went on under a cornice, the projection of which prevented us from seeing the sky. The path winds like the river; at the last turning we came suddenly before the immense opening of the grotto. The aspect of this spot is majestic even to the eye of a traveller accustomed to the picturesque scenes of the higher Alps. I had before this seen the caverns of the Peak of Derbyshire, where, extended in a boat, we traversed a subterranean river, under a vault two feet high. I had visited the beautiful grotto of Tresheimschitz, in the Carpathian mountains, the caverns of the Hartz, and those of Franconia, which are vast cemeteries of bones of tigers, hyenas, and bears, as large as our horses. Nature in every zone follows immutable laws in the distribution of rocks, in the exterior form of mountains, and even in those tumultuous changes which the exterior crust of our planet has undergone. So great a uniformity led me to believe that the aspect of the cavern of Caripe would differ little from what I had observed in my preceding travels. The reality far exceeded my expectations. If the configuration of the grottoes, the splendour of the stalactites, and all the phenomena of inorganic nature, present striking analogies, the majesty of equinoctial vegetation gives at the same time an individual character to the aperture of the cavern. The Cave of Guacharo is pierced in the vertical profile of a rock. The entrance is toward the south, and forms a vault eighty feet broad and seventy-two feet high. This elevation is but a fifth less than that of the colonnade of the Louvre. The rock that surmounts the grotto is covered with trees of gigantic height.” The learned traveller then goes on to describe the vegetation, remarkable alike for its beauty and exuberance, round the mouth of the cavern, and proceeds—“We measured the way by means of a cord, and we went on about four hundred and thirty feet, without being obliged to light our torches. Daylight penetrates even into this region, because the grotto forms but one single channel, which keeps the same direction from south-east to north-west. Where the light begins to fail, we heard from afar the hoarse sounds of the guacharo birds; sounds which the natives think belong exclusively to those subterranean places.” The guacharo is a bird about the size of a fowl, with dark bluish grey plumage, and having on the head, wings, and tail, large heart-shaped white spots edged with black. Its eyes, which are blue, are injured by the blaze of day, and, like the owl, it prefers the darkness. It quits the cavern at nightfall, especially if the moon shine. “It is difficult,” says Humboldt, “to form an idea of the horrible noise occasioned by thousands of these birds in the dark part of the cavern; it can only be compared to the croaking of our crows, which, in the pine forests of the north, live in society, and construct their nests upon trees, the tops of which touch each other.”

About midsummer, the Indians kill enormous numbers of these birds for the fat which covers some parts of their bodies in thick layers. The slaughter takes place amongst the young brood, who are dislodged from their rocky nests by means of long poles, the old ones all the while flapping their wings over the heads of the destroyers of their young, and uttering appalling cries of distress. The fat is melted in pots of clay, and, when prepared, appears to be of the consistency of molasses, is transparent, inodorous, and so pure that it may be kept more than a year without becoming rancid. The oil obtained from the guacharos

has been used by the natives from a high antiquity, and the Catholic missionaries make use of it in their lamps. The destruction of birds is very great, in comparison with the quantity of unctuous matter obtained; and it is supposed that the race would long since have been exterminated, had not several circumstances contributed to its preservation. In the first place, the Indians seldom have the courage to penetrate far into the cave, from superstitious motives. Mystic ideas are connected with these nocturnal birds, and their realm of darkness. They believe that the spirits of their fathers sojourn in the gloomy recesses of the subterranean; and with them, to go and mingle with the guacharos is to rejoin their ancestors—to die.

The cavern continues to wind in the same direction, to be of the same breadth, and to retain its original height of about seventy feet, for a distance of 1458 feet, beyond which it begins to contract in its dimensions. Throughout its length flows a stream of water, in some places thirty feet in breadth and two feet in depth, but from what source this subterranean river comes, no one has yet been able to tell, as the roughness of the cavern, and various impediments, prevent the progress of explorers beyond a certain point. On issuing from the mouth of the cave, and running a few leagues, the stream joins the river Santa Maria, whose waters ultimately fall into the Gulf of Paria. Humboldt was astonished to find the cavern abounding in vegetation considerably beyond the distance which the sun's light penetrated. It appears that seeds which are carried into the cave by the old birds to feed their young, spring up wherever they can fix themselves in the mould that covers the calcareous encrustations. Blanched stalks, with some half-formed leaves, were found to have attained the height of two feet. It is well known, that, when light is excluded from plants, they become pale and disfigured, of which an instance, on a grand scale, was here afforded. In advancing, the vault gradually began to contract in height; and in proportion as it became lower, the cries of the guacharos sounded more shrill and piercing. The Indians at last refused to proceed any farther, and Humboldt was compelled to retrace his steps to the free air and the light of day. He found that a Catholic bishop had penetrated much farther than he, having measured nearly 2500 feet from the mouth to the spot where he stopped, although the cavern, to all appearance, extended a great deal deeper. Some have asserted that it is miles in length, but this is not credited by more sober thinkers. It is, however, undoubtedly one of the most spacious grottoes known in the limestone formations.

In connection with this cave we may add a few sentences on the origin of caverns in general, so interesting in a geological point of view. If there be one man more than another entitled to offer an opinion on the subject, it is Humboldt, who has examined so many both in the old and in the new world. He thinks that their formation must be referred to causes totally different. With regard to the largest and most remarkable class, those of the limestone and gypsum formations, the horizontal direction of the galleries, and their gentle and uniform slope, obviously point to an aqueous origin; that is, running water, by erosion, has gradually enlarged clefts already existing, and carried off the more friable parts. Amongst primitive rocks, real grottoes are only found in the calcareous formations. When analysed, stalactites are found to exhibit all the characters of a chemical precipitate. It is known that a small quantity of carbonic acid is sufficient, after long contact, to give to water the power of dissolving a portion of carbonate of lime. Humboldt remarks, that the Jura limestone, to which the grottoes of the valley of Caripe belong, abounds so much with caverns in both hemispheres, that some German geologists have called it *hohlenkalkstein*, that is, cavern-limestone. The form of these subterraneans depends partly on the nature of the rocks in which they occur, and partly on the agent which has been at work in their formation. “From what I have seen,” says our learned traveller, “in the mountains of Europe and the cordilleras of America, caverns may be divided, according to their interior structure, into three classes. Some have the form of large clefts, or crevices, like veins not filled with ore; such as the cavern of Rosenmuller in Franconia, Eldon-Hole in the Peak of Derbyshire, and the sewers of Chamacasapa, near Tasco, and Tehuilotepic in Mexico. Other caverns are open to the light at both ends; these are rocks really pierced through—natural galleries, traversing a solitary mountain. Such are the Hole-berg of Muggendorf, and the famous cavern of Danto in Mexico. A third form, and the most common, exhibits a succession of cavities placed nearly on the same level, in the same direction, and communicating with each other by passages of greater or less breadth.” We are then to consider the caverns which are found in calcareous rocks as produced by the action of water, but those belonging to the volcanic rocks appear to result from gaseous emanations, acting in the direction in which they find the least resistance. Fire, too, occasionally has acted like water in carrying off substances. A cavern in the Mauritius, or Isle of France, is supposed to have originated in the melting of a mass of glance-iron by a volcanic eruption. Mephitic and deleterious gases of various kinds are often found in the caverns of gypsum mountains. Humboldt observes, that in these cases it is not the sulphate of lime which acts on the atmospheric air, but the clay slightly impregnated with carbon, and the fetid limestone, which are so often mingled with the

gypsum. Unless the caverns of the calcareous formation contain animal remains, they are not liable to these decompositions of the atmospheric air. None of these have hitherto been discovered in Caripe.

In conclusion, we shall briefly refer to a few of the most remarkable caves known. Some of them are of a truly amazing depth. That of the Peak of Derbyshire, already mentioned, has been sounded by a line of more than 9600 feet, without any bottom being found. Near Fredericksdal, in Norway, there is a cavity, into which if a stone be precipitated, two minutes elapse before it is heard to reach the bottom; and hence it has been concluded that its depth is upwards of 11,000 feet, more than two miles. In Carniola there are numerous caverns, one of which at Adelsberg is said to afford a subterranean walk of several miles. Some caverns present very remarkable phenomena. There are those from which, in the heat of summer, an ice-cold wind issues with great violence. Others, again, have their walls glazed with ice in autumn, and in December this coating melts away. The caverns most interesting and most curious for their natural productions, are those from whose roofs water, impregnated with calcareous matter, has dropped, and which either remains suspended from the vaults in the shape of long crystals, or, falling to the ground, assumes a variety of fantastical forms, often bearing a singular resemblance to various vegetables and animals. These are called stalactites, and it is this circumstance which confers such celebrity on the grotto of Antiparos, situated in the island of the same name. The floors of many caverns are covered with petrified bones. These are vast natural cemeteries, where whole generations of beings have been deposited in some of the revolutions which the globe has undergone. Some caverns contain wells, or sheets of water, so large that they have acquired the name of subterraneous lakes. We have seen that a river issues from the Cave of Guacharo—there are others which exhibit the same phenomenon; and what is more extraordinary, there are some which receive very large streams, which lose themselves in the interior, and are seen and heard of no more. Norway presents us with several, where, as the explorer treads along the arched and calcareous floor, he hears the roar and dash of invisible torrents under his feet. Volcanic caverns are numerous and remarkable. There is one at Satur in Iceland, above 5000 feet in length, and having three of its sides or walls covered with a greenish-black varnish, a volcanic vitrification. From the roof depend long spikes of lava, and through the chinks in many places the rays of the sun are admitted. But, perhaps, the most splendid of all known subterraneans is our own Fingal's Cave, in the island of Staffa. Here we find thousands of majestic columns of basalt supporting a lofty roof, under which the ocean rolls in everlasting murmurs.

OCCASIONAL NOTES.

A NEW KIND OF CANDLES.

THERE is a new method of making candles, which perhaps few of our readers have heard of. The object of the manufacturers is to make tallow candles resemble wax candles, both in appearance and burning, and this they accomplish in a surprisingly successful manner. The process employed to transform the tallow into a substance like white wax, is very ingenious. It consists in various operations of boiling and purifying, which we do not consider ourselves at liberty to describe; and, at a certain stage, the tallow is run into moulds, so as to form cakes of about an inch in thickness, and a foot or two in length and breadth. These cakes, when cool, are piled one upon the top of another, but with a layer of coarse mat between, to keep the cakes from sticking to each other. The pile of cakes thus interspersed with mats, is next put into a press of enormous power; and pressure being applied, a dark yellow oil is squeezed from the cakes. No screw-press can give force sufficient for this operation: a hydraulic press is used, wrought by a steam-engine, and the oil is seen pouring like a shower down the sides of the pile, and running away in troughs at the bottom. After the oil has been sufficiently expelled, the cakes are taken out, and they seem as hard as a piece of board; in short, the tallow has been *warified*, and has lost both the smell and the taste of grease. The cakes are now ready to be melted and run into candle moulds in the usual manner; but something else is wanting to complete the process. The wicks consist of three strands of cotton plaited together, and upon these the candles are moulded. The plaiting of the wicks is of much importance. In common tallow candles, it is observed that the wick in burning stands up in the centre of the flame, and, therefore, weakens the light. Snuffing remedies this evil, though only for a minute or two, and constant snuffing is a serious annoyance. When the wicks are plaited, they do not stand up in the flame. As the candle consumes, the burnt wick curls aside out of the flame, and presents a nose to the atmosphere, by which the substance of the wick is dispersed without any snuffing, as in the case of wax candles. So close, indeed, is the resemblance which these compressed tallow candles have to candles of wax, that no person, without careful examination, could discover the difference, while they are only about one-half the price. It was a Frenchman, we believe, who discovered the process of making candles on this principle, but it has been brought to perfection only by English capital and perseverance. At the large establishment of Messrs

Edward Price and Co., at Vauxhall, which we lately visited, candles are now made according to this ingenious process of manufacture to an inconceivably large amount; and, though far inferior in brilliancy of light to our own beautiful gas, they are unquestionably a great improvement on the old kind of tallow candles, which, indeed, they must entirely supersede in warm climates.

ADVICES (USELESS).

The practice of buckling a leathern belt round the waists of children—particularly round little boys—which has lately come into fashion, is, we observe from a late medical work, discommended as frequently injurious to growth. The writer, who is Mr Hare, surgeon in Leeds, in treating of curvatures of the spine, thus observes:—"A custom at present prevails to a very considerable extent, of using a leathern belt buckled round the waist of boys, when they commence wearing their clothes of woollen cloth; this practice, unless adopted with great care, has a direct tendency to produce a contracted state of the chest and upper part of the abdomen, similar in effect, though not in degree, to that produced by corsets in growing girls: it is hoped that it is only necessary to point out the evil, and that parents will at once see the necessity of avoiding it."

Mr Hare, in the same work, presents a number of lamentable cases of curvatures of the spine, consumptions, and other diseases, produced by tight lacing; but that is a subject of which it is not of the smallest use to speak, with the hope of remedying the evil; our young women have got a crotchet into their heads that small waists are handsome—though, by the way, we never heard any gentleman say so—and, consequently, no species of admonition will cause them to desist from the pernicious practice of squeezing themselves out of shape. A medical friend lately suggested the propriety of our making publicly known the injury which girls and young ladies also suffer by a strange practice lately introduced, of wearing the shoulders of their frocks down upon their arms. The injury, he told us, does not consist in the exposure of the whole neck and shoulders to the atmosphere, though that, no doubt, is something, but in the prevention of a free motion of the arms, by which the chest is confined, or prevented from expanding in a natural manner. We make this known through the wide circle of our readers, but without expecting that the notice will cause a single young lady to alter the fashion of her attire. Like tight lacing, the silly custom of exposing the shoulders and pinning down the arms, must be left to run its course.

A FEW WEEKS ON THE CONTINENT.

HEIDELBERG TO FRANKFORT.

THE route which we have now to pursue is from Heidelberg to Frankfort, being the commencement of our return homeward. The road lies along the base of the Odenwald range of mountains, and, consequently, in our progress northwards, we have on our left that large flat plain of the Upper Rhine, which has been described in the preceding article. Crossing the stone bridge over the Neckar, and shortly afterwards turning round the corner of the projecting hill opposite Heidelberg, the plain is before us in all its green fertility, while the lofty peaks of the Odenwald on our right are observed at intervals to be crowned with ruined castles, once the abode of feudal or robber chiefs. On account of its proximity to the bergs or mountains, the road has been called the Bergstrasse, and is pursued by all travellers who are in quest of romantic scenery.

From Heidelberg to Frankfort, the distance is, I should suppose, forty miles, the town of Darmstadt lying at about two-thirds of the way; and, therefore, while the calash is jogging on at an easy pace, and we are about to leave the territory of Baden behind us, I will embrace the opportunity of making a few general remarks on the condition of things in this quarter of the world.

The appearance of the country through which we had travelled, differs very materially from what is seen anywhere in Britain. There are no gentlemen's houses scattered about, even in the midst of the most beautiful scenery; no substantial farm-buildings; no cottages by the roadside; and, in fact, no isolated dwellings of any description. The whole population is congregated in towns or villages, and in most instances these places are either walled, or show some remains of a state of defence; every town, at least, is guarded by soldiers stationed at barriers at its entrances. The gentry, whom I presume to be the proprietors of the land, live entirely in the towns. The peasantry, who conduct the agricultural operations, live in the villages; and every village is thus little else than a number of farm-houses, barns, and stables, standing in a cluster. Perhaps a number of the small farmers in these villages are proprietors of the bits of land they cultivate; but if this be the case, it does not seem to elevate them above the general level of the rural population. A state of poverty appears to prevail over the whole territory. No doubt, some are better off than others; but, taking the bulk of the people in the villages of

Hesse-Darmstadt, Bavaria, and Baden (also of Nassau, which I shall by and bye have to describe), they seem to be more miserable in their condition than the peasantry of England or Scotland. Their houses are commonly built of wattle and yellow mud, and are dreadfully cold in winter, for want of fuel. Their clothing is scant and coarse, and in many places I observed that the women who were working in the fields had no shoes. Their food, as I was informed by those acquainted with their habits, is of the most meagre kind; rye and barley bread, potatoes, apples, milk, and a little butter and cheese, are their principal articles of diet. Though most of them cultivate vines, they dare not eat a grape, and of the wine they must not drink a drop—all, like the Irishman's pork and beef, goes to pay the rent, and what does not press so sore in the Irishman's case, the taxes. In Baden, I observed that tobacco is cultivated to a considerable extent; but whether this materially adds to the comforts of the people, I am unable to say.

The want of capital in these countries is very striking. The soil is light and sandy, and evidently possessed of considerable productive power, but the style of cultivation is a perfect burlesque on farming. A strange old-fashioned wooden plough, mounted on wheels, is drawn by two cows yoked together at the horns; and to see these poor little animals walking patiently with the machine after them along the fields, would inspire any person with pity. All the farm-carts are also drawn by cows yoked in the same manner, and the drivers are generally grotesque figures in blue linen smock-shirts and three-cornered cocked hats. In short, the whole arrangements for cultivating the ground, carrying the produce to the villages, and preparing the corn for market, are on the most primitive scale, hardly advanced, I should think, beyond the processes mentioned in the book of Ruth, and other parts of the Old Testament. Notwithstanding all this, the crops of grain were tolerable, and gave token of what they would be under a right system of management. Neither in the open country nor in the villages did we see any stackyards; such a thing is unknown, for the farmers cannot afford to keep their produce on hand till a good market occurs. Thus limited in their ways and means, the poor German farmers receive comparatively small prices for their grain, and hence the lowness of the cost of provisions. Generally speaking, every article of native produce is only half the price it is in this country; in other words, when we are paying eightpence for four pounds of bread, the German is paying no more than fourpence. As the wages of labour correspond to these low prices, the cost of manufacturing articles is much less than it is in Britain, and must doubtless tend to injure the sale of British manufactures, not only in this part of the continent, but in those countries to which the cheaply produced German goods are sent. A cotton factory which we saw on the Rhine near Mayence, and another which we observed in the course of erection at Mannheim, cannot fail to be conducted at a half, and most likely a third, of the outlay for wages that would be incurred at Manchester or Glasgow.*

In alluding to the subject of German manufactures, I am reminded of an arrangement now prevailing all over the countries on the Middle and Upper Rhine, and also the other parts of Northern Germany, which has a most injurious effect on the transmission thither of British goods; I mean the Prussian League. Formerly, every principality, great and small, was independent as regarded commerce, and had its own body of officials for exacting duties on the transmission of goods. This was a most vexatious system for travellers, as they were searched at every barrier, and greatly delayed in their journey; but it did not practically exclude goods arriving from foreign countries, and was not complained of by merchants. Quite a new arrangement now prevails. There are no barriers or custom-houses at the dividing boundaries of the different states. The traveller may go where he pleases, and nobody stops him; he is only made aware that he is entering a different state by seeing a peculiarly striped post, blazoned with a coat of arms, stuck up on the side of the road. The importation of foreign manufactured fabrics is, however, annihilated. The confederacy, or league, has rendered the whole of Northern Germany, as respects commerce and custom-house duties, but one great principality, of which the King of Prussia is monarch; and as it is the object of that personage to encourage the manufactures of his own kingdom to the exclusion of those of all foreign powers, Prussia is, in point of fact, becoming the fountain whence a most extensive and populous region in central Europe is supplied with manufactured articles.† The signs of this are very

* Mayence is celebrated for manufactures in leather, particularly boots and shoes. The leather (calf) is soft and smooth, being obviously prepared in a superior manner to what we see in this country. I bought a pair of boots of this fine leather for 14s., being about the half of what such articles would have cost me in Edinburgh. The boot-maker mentioned that he kept a vast number of men—a hundred, I think he said—employed in making boots and shoes for exportation to nearly all parts of the continent.

† I believe that the larger proportion of British fabrics formerly introduced into Germany, were smuggled from certain free importing states into those districts from which they were legally excluded. Frankfort used to be a centre whence British goods were dispersed to a large extent by smugglers; of course, the Prussian cordon, which now surrounds the various states, has stopped this underhand species of traffic.

conspicuous in the drapers' shops of Cologne, Coblenz, Mayence, Mannheim, and other places, where nearly all the goods are of a continental make, and chiefly from Elberfeld on the Lower Rhine. The Prussian League seems altogether to have been a masterly stroke of policy, and nothing is now wanting but capital to render the countries over which it operates the seat of a system of manufactures as great as that which has hitherto characterised Great Britain.

It is not the least gratifying symptom of improvement in these countries, that the people are becoming daily more intelligent, in consequence of the universal establishment of schools. In Prussia, as is well known, school education is conducted on the most extensive principle, parents being compelled by law either to send their children to a school of their own choice, or to the common school provided by the state. The whole expense incurred for school-houses, teachers, books, &c. is liquidated by the government. The natural consequences of this munificent system of education are the spread of general intelligence, a higher tone of morals, and diminution of crime. The benefits of such an enlarged system of education are not, however, confined to Prussia; an example is set to the small states round about, which they feel themselves impelled to follow. I found that among the poor peasantry of Hesse Darmstadt and Nassau, schools are widely established by the vigilant and paternal care of the governments, and nothing prevents the whole juvenile population from being instructed but the disinclination of the parents to lose the services of their children during school hours. From a printed statement which I procured at Mayence, it appears that at the close of the year 1834, there were in Hesse Darmstadt 350 schools, attended by 32,708 pupils, being about a 24th of the entire population. Up till the year 1821, education was greatly retarded by the jealousies of the three principal sects, Roman Catholics, Calvinists, and Lutherans, each of whom made an ineffectual struggle to support schools for itself; in 1821, the parish of Mölsheim began to see the hopelessness of such an arrangement, and united its three schools into one; other parishes followed the example, and now there are no schools of a common order adapted for particular sects. "Much opposition (says my authority) was on the part of some conscientious Christians made to this arrangement, from a fear that the religious faith of their children might be shaken through the amalgamation of sects together, but this feeling is fast dying away; and now, where separate churches do not exist for the different forms of worship, the religious duties of each are alternately performed on the same day and under the same roof." And with respect to the influence of education on the manners of the people, "it soon became perceptible, in the diminution of crime and drunkenness throughout the country, how beneficial was the system adopted." These scraps of information are not of great value; but, as showing, however feebly, that the human mind is advancing in intelligence, not by any means standing still or retrograding, in the countries on the Upper Rhine, I have taken the liberty of bringing them under the notice of my readers.

We may now, after this long digression, proceed on our way to Frankfort. Passing through several antique villages, and catching a glimpse, now and then, of a ruined castle on the vine-clad heights which skirted our path, we at length reached the town of Darmstadt, the capital of the grand-duchy. It is pleasantly situated on a very gentle slope, with a western exposure, and consists of rows of handsome white houses crossing each other at right angles, like the streets of Mannheim. At the head of the main street stands the palace, an old edifice of red sandstone, plastered, but much of the plaster fallen off, so as to have rather a shabby appearance. Near the palace there are some beautiful walks in a park tastefully laid out with wood and water, and open to the free entrance of the public. The town has a singularly clean appearance, and though exteriorly dull to strangers, is not without a spice of gaiety in its composition. Inhabited principally by *rentiers*, or those who live on small patrimonial revenues, it offers various means of amusement in the form of theatrical entertainments, balls, concerts, and assemblies, varied with field-sports. During the late reign, Darmstadt enjoyed the highest reputation for its musical entertainments, for the grand-duke was passionately fond of music, and supported a band of operatic performers. So absorbed was he in this pursuit, that, disregarding the usual etiquette of a court, he constituted himself leader of the orchestra in the public theatre, and there, in a conspicuous seat appropriated to himself, might be nightly seen fiddling and grinning with all the usual energy of the character he so fitly represented.

Departing from this neat little capital of a German state, a ride of a few hours through an open country brings us to the neighbourhood of Frankfort. On gaining the summit of an ascent on the road from Darmstadt, and emerging from a long avenue of lofty trees, we have before us, in looking northwards, a wide fertile valley, through which flows the Main towards the west, and at the distance of a few miles falls into the Rhine above Mayence. In the middle of the valley, and on the right bank of the Main, stands the city of Frankfort, which we shortly reach, on passing through a suburb on the left bank of the river, and crossing its long stone bridge.

Frankfort was the most English-looking town we had seen on the continent. In driving into its suburbs,

which are lined with elegant villas, one might almost be made to believe that he was entering the outskirts of London. The reason for this is, that Frankfort is a free town, the capital of its own small territory of a few square miles, and, by the good sense of its governors, has been stripped of its walls and fortifications, leaving the town to expand where taste or opulence may direct. The situation has no strikingly romantic feature, but is exceedingly beautiful, and highly advantageous for commerce. After witnessing the unhappy manner in which the waters of the Rhine are shut out by walls and military erections from the towns of Coblenz and Mayence, it was exhilarating to perceive that the Maine at Frankfort is lined with capacious open quays, and that these are in some places as highly ornamented with elegant mansions as are the banks of the Seine at Paris. The Maine is a broad, but not deep river, and is navigated by vessels of a moderate size, engaged in traffic, and in carrying passengers to and from Mayence. The interior and environs of the town have been greatly improved in recent times, one of the chief alterations being the opening of certain wide thoroughfares through the clusters of narrow streets and alleys. I know no street, indeed, in any city, which surpasses in width, or in the grandeur of its edifices, the great central thoroughfare called the Zeil. Some of the hotels in this street can be compared only to magnificent palaces, with accommodations to an astonishing extent. That at which we remained during our stay, provided dinner for a hundred persons daily, in table-d'hôtes at different hours, to suit the habits of Germans and English. It is also worth while to mention, that, notwithstanding the splendour of the establishments, and the excellence of the viands and attendance, the cost of living in one of these hotels is not more for a whole week than would be paid in certain hotels in London for a single day.

Frankfort is the seat of the German Diet (or assembly of envoys from the different German states), and consequently possesses, to a certain extent, the character of a capital. Here reside ambassadors from the chief European powers; and as these live in a style above the rank of common citizens, they assist in giving an air of aristocratic elegance to the society of the town. Unfortunately for its character of a free town, Frankfort has for some time been guarded by a troop of Austrian and Prussian soldiers, who are stationed at the various entrances. The cause of this awkward predicament was the foolish attempt made some time ago by a body of students from a neighbouring state, to revolutionise Germany, and make Frankfort the centre-point of their rebellious operations. Besides the Austrian and Prussian soldiers, there are some local troops constantly under arms; and at the main guard-house, at the centre of the town, may be observed two or three field-pieces standing ready for use, should occasion require. It can hardly be supposed that the free city of Frankfort feels itself very comfortable thus surrounded and filled with emblems of force, and, it may be, of civil disaster.

The population of Frankfort, which is 40,000 in number, among whom are 5000 Jews, is chiefly engaged in manufacturing and mercantile pursuits, the place having long formed a favourite central depot in the commercial and banking transactions of Germany. The wealthy family of the Rothschilds sprang from a small banker and negotiant in this town, and here one of the brothers resides. The principal merchants in the town live in a style of much magnificence, and are celebrated not only for the ease and liberality of their manners, but for their encouragement of the fine arts. One of these gentlemen, Mr Bethman, possesses a piece of sculpture of exquisite beauty, which no traveller omits to visit. This wonder of modern art is the figure of Ariadne sitting in a graceful posture on the back of a tigress; the group is the size of life, and sculptured out of a single block of pure white marble, by Dannecker, an artist of Stuttgart. Placed in a pavilion in the midst of a beautiful garden and shrubbery, open to the visits of strangers, the figure of Ariadne forms a rare object of attraction, and fails not to charm all who behold it. The perfect elegance of the design is not less striking than its singular chasteness; and as a work of art, it must be ranked next to the products of the higher class of ancient Grecian sculptors. Young men studying to attain a high degree of excellence in the art of sculpture, could not do themselves a greater service than by visiting Dannecker's Ariadne at Frankfort.

From viewing this almost unparalleled object of art, we proceeded to visit other places usually shown to strangers, but an account of these can afford no interest to readers, and I merely state that we were, by the kindness of a friend on the spot, introduced to the Seckenberg Museum of Natural History, which is of great extent, and particularly rich in ornithological specimens. By the unwearied exertions and enthusiasm of a single individual, M. Edouard Ruppel, the collection has risen to the first rank in museums of this description. From a pure love of science, and to raise the fame of his native town, that gentleman travelled over various parts of Asia and Africa, every where collecting rare animals, whose skins he transmitted to Frankfort for preservation.

While at Frankfort, I, according to custom, made some inquiries respecting the state of primary education, and also visited such schools as appeared worthy of attention. Common-school instruction, as I found, is as general here as any where in Holland, there

having been a great extension and improvement of the schools within the present century. Besides various schools conducted for special objects and by particular sects, there is a large model seminary established by the governors of the town, at which a liberal course of instruction is given to pupils of both sexes. It possesses a number of masters and instructresses, and 520 pupils attend the various classes. No special religious instruction is given, so that children belonging to all sects attend. There is a school of a similar kind for children belonging to a humbler order of society, at which are charged certain small fees, which the town contributes when the parents are unable to pay them. This is unquestionably a less objectionable mode of educating the poor than that of placing them in separate schools, as in Holland, and is practically that which has always been in use in the parochial schools of Scotland.

The environs of Frankfort, including a pretty little island in the river Maine, have, since the demolition of the town defences, been laid out in the form of pleasure-grounds, with charming serpentine walks through them, for the use of the inhabitants. During the fine evenings in summer, these are crowded with well-dressed persons of all ranks and conditions, for the purpose of healthful recreation in walking, or to hear bands of music which occasionally play for their amusement. In our visit to the walks during these evening entertainments, the same feeling came over us that we had experienced on witnessing similar scenes in Holland, namely, that the people of continental towns enjoy far more positive enjoyment in out-of-door recreation than we can lay claim to in this busy money-making country.

It was not without considerable regret that we felt ourselves compelled to depart from Frankfort, which is evidently much in advance of many towns in this quarter of Germany. The course of our journey carried us a few miles in a north-westerly direction to Wiesbaden in Nassau, which will form the subject of the next article.

A ROYAL ODDITY.

JAMES, styled Sixth of Scotland and First of Great Britain, who reigned over the former country nearly sixty years, and over England and Scotland united for twenty-three, has been treated by our historians in their usual grave manner. No mistake could be greater. This monarch was simply an oddity; and his acts, instead of being rigidly censured and praised as those of an accountable person, should be considered as illustrations of the science of insanity. He was not, let it be observed, either fatuous or a maniac. But it is an error proper to our present state of ignorance on the subject of mental philosophy, to suppose that those only are of unsound mind who are glaringly unfit to conduct ordinary affairs, and make a tolerable appearance before society. There is a class of cases, in which we see large capacity, good powers of expression, and even some appearance of what is called genius or talent, but where all is upset and ruined by some strange whimsicality, or weakness, exhibiting itself in a devotion to trifles and vanities, or perhaps in a ridiculous selfishness, possibly not unaccompanied by tendencies to more serious faults. The difference between men of this sort and thoroughly insane persons seems analogous to that between pottery of bad material and make, and that kind which has only received so slight a flaw in the finishing that it is not unfit for sale and use. The common sense of mankind, even in his own age, led them to surmise that the mental imperfection of James was not original in his constitution, but the result of circumstances which took place a few months before his birth. These circumstances are well known. A band of armed men, including her own husband and some of her principal councillors, burst into a room where Mary was sitting at supper, and slew her favourite Rizzio almost in her presence. Unsheathed weapons flashed that night in her eyes, and she afterwards declared that at one moment, while the lights were extinguished, she felt the muzzle of a pistol laid to her bosom. Her child, she said, should yet revenge the indignity; but the laws of nature decreed otherwise. He was only rendered, by this event, the weakling who, when grown to man's estate, so far from troubling himself about the long bygone outrages which she suffered before his birth, had not even the spirit to resent the scarcely disguised murder which was perpetrated upon her before his eyes. A drunkard nurse added to the evil by giving him vitiated milk; and, although a crowned king at thirteen months, he was not able to walk till his sixth year. Under Buchanan he showed considerable capacity for learning; but though he came to know much, and could talk most surprisingly of what he knew, nothing—not even Buchanan—could make him a wise man. His weakness was shown in youth by his giving himself up to dissolute favourites, and by the want of all firm and dignified principle in his government. He at the same time manifested literary talents which, if his personal conduct could have been kept out of view, must have inspired respect. A moral poem of his on Pastime, published when he was only eighteen, is equal in language and thought to the best contemporary verse among his subjects. No one, in truth, knew better than James all that could be said on any moral theme; and we are quite serious when we aver that his advice to his son, in the work entitled the *Basilicon Doron*, form a treatise of very great merit

and excellence. But not one of the good principles which he knew and understood seems to have ever entered into, or become influential over, his own ordinary conduct. While, in discourse, or in writing, he seemed a sage, he was personally a votary of childish follies, a profane jester, and a tippler. His ancestors had all found it necessary to buckle their swords to their sides before they were of age, in order to defend their thrones and their country, and almost all of them had been gallant and heroic men; but he shrunk from the sight of a glancing weapon, and courted peace when there was no peace, purely from want of all manly courage. It is not, however, strictly true that he never drew or used a sword, as is generally said. On one occasion, when irritated to an unusual degree by the contumacy and turbulence of his cousin the Earl of Bothwell, he rushed at one of the party of that traitor with a drawn sword, and would have killed him, if not restrained by some of his attendants. This, perhaps, will only be deemed the exception which confirms the rule.

During his exclusively Scottish reign, he was engaged in perpetual squabbles with the clergy. They were possessed of great popular influence, and claimed an exemption from all secular control. He, on the other hand, aimed at a supremacy over them, such as Elizabeth enjoyed over the English clergy. Many whimsical circumstances marked the struggle. Andrew Melville shook him on one occasion by the sleeve, and called him "God's silly vassal." Another had one Sunday intruded himself into the pulpit of the church which James attended, with the design of telling his majesty a little of his mind. The king, seeing him, called to him to come down. The minister refused. James repeated the order, and a ridiculous altercation took place between them, which was at last concluded by the minister coming down and leaving the church, with half the people, but not till he had told the king that a day would come when his conduct on this occasion should stand up in judgment against him. In those days, the minister of Prestonpans would call at Holyroodhouse, to remonstrate with the monarch on account of certain alleged omissions of religious duty; and when James was attacked in his palace by one of his turbulent nobles, another preacher would not scruple to tell him to his face, in the pulpit, that for his indifference "God had made a noise of crying and sent fore-hammers to his door." An Edinburgh pastor named Bruce—ancestor of the Abyssinian traveller—plainly told the king one day that he might take his choice between the Earl of Huntly and him: either give up Huntly's friendship or Bruce's, for both he could not retain. James never forgot the vexations to which he was thus exposed.

Poverty added not a little to the difficulties of his Scottish reign. His revenues were so small, that, without a pension of five thousand pounds a-year from Queen Elizabeth, he would have been unable to maintain a guard. His expedition to Denmark to bring home his queen, was only rendered possible by the kindness of one or two of the Fife ports, which furnished the necessary vessels. All the preparations for a decent reception to her majesty on her arrival in Scotland, were the result solely of the beneficence of the citizens of Edinburgh. His letter to these gentlemen from Denmark, in which he entreats them to have their dunghills removed from the streets against his coming, is a most amusing illustration of the habits of his people, as well as of his grotesquely familiar manners. In another letter written at this time from Denmark, he tells his young favourite Lord Spynie to be industrious in his courtship of a certain wealthy widow:—"Mind Jean Lyon," he says, "for her auld tout will mak you a new horn." There is a letter of his preserved by a landed family in Ayrshire, in which he makes serious application to the representative of that day for the loan of his silk stockings, that he might make a decent appearance before a certain Spanish ambassador. A good humour not easily conquered got him over all the difficulties of this part of his life triumphantly. This was perhaps his most conspicuous quality, and it was one which served, in his case, as in that of his witty grandson, to extenuate many grave offences in the eyes of the people. Not long after his accession to the English throne, when hunting at Royston, one of his dogs was found to have a paper tied round his neck, containing these words:—"Good Mr Jowler, we pray you speak to the king (for he hears you every day, and so doth he not us), that it will please his majesty to go back to London, for else this country will be undone; all our provision is spent already, and we are not able to entertain him any longer." The king laughed at the joke as heartily as any. On another occasion, a pasquin reached him, in which he was very abusively treated. As he read, he kept saying, "If there were no other men in England, this rogue must hang for it;" till at last he came to the concluding couplet—

"Now God preserve the king, the queen, the peers,
And grant the author long may wear his ears!"

when he burst out a-laughing, and dismissed the thing with the remark, "By my saul, thou shalt, for me; thou art a bitter, but a witty knave." Cruelties are charged against James: his treatment of Raleigh, in particular, is one of the most painful passages in our history. It will be found, in all such cases, that his fears were excited to an unusual degree. Timidity made him clement, as well as cruel; his treatment of the Gunpowder conspirators was a noted example. But good nature was unquestionably the supreme feature of

his character. Of this a noted proof is given by his biographer Wilson. In the latter part of his life, when various perplexing affairs had made him irritable, having occasion to refer to some papers relating to the negotiations with Spain for a bride to his son, he could not for a long time recollect where they were. At length he came to the conclusion that he had placed them in the hands of his ancient and trusty Scotch servant John Gib. Gib assured him that he had not received the papers. The king grew angry, and persisted in saying that Gib must have them. The man then threw himself at his master's feet, and offered himself for immediate death if he should be proved to have got the papers. James, in his rage, kicked the faithful servant. Gib rose and said, "Sir, I have served you from my youth, and you never found me unfaithful: I have not deserved this from you, nor can I live with you longer after this disgrace. Fare ye well, sir; I shall never see your face more." He then left the royal presence. Soon after, another person connected with the court, hearing of what had happened, came to inform the king that the papers had been placed in his hands; and he forthwith produced them. James instantly dispatched a courier to bring back Mr Gib, saying he should never again eat, drink, or sleep, till he should see him. On the return of the indignant servant, the king of Great Britain, France, and Ireland, knelt down before him, and humbly asked his pardon, nor would he rise till it was pronounced. There is folly here, but at least it is not the folly of an ill-natured man.

The figure and aspect of the king have been made familiar by the admirable portraiture of the Great Novelist, the materials of which have been chiefly derived from the contemporary work of Anthony Weldon. He wore clothes thickly quilted, to repel the daggers of assassins; shambled in his gait, in consequence of the weakness of his limbs; and, having a tongue too large for his mouth, could not drink without bespattering the bystanders. He had a meagre beard, and a skin so soft and irritable, that he could not bear to wash it. He rode clumsily, and was often thrown in hunting. Though fond of the society of handsome and well-dressed young men, he was himself indifferent about clothes, never making a change as long as they would last. Upon the whole, his appearance was not uncomely. He was full of strange antipathies. The chief were tobacco, ling, and pork—the last being a national dislike. His Counterblast to Tobacco is often talked of, but rarely read. Any one who should look into it, could scarcely fail to be amused by its quaint humour. It was a saying of the king, that, if he had occasion to entertain the sovereign of a certain region not describable by name to polite ears, he should make the feast consist of ling for fish, pork for the second course, and a pipe of tobacco for digestion. Ben Jonson has taken notice in a masque of the whole of the king's known dislikes, classifying them under the different senses. Gipsies, squinteyes, unchaste women, and women who ruled their husbands, are the chief antipathies of his sight. As for those of his hearing, we may give them in Ben's own words:—

From a fool, and serious toys;
From a lawyer three parts noise;
From impertinence, like a drum
Beat at dinner in his room:
From a tongue without a file
Heaps of phrases and no style;
From a fiddle out of tune,
As the cuckoo is in June;
From the candlesticks of Lothbury,*
And the loud pure wives of Banbury,†
Or a long pretended fit,
Meant for mirth, but is not it,
Only time and ears outwearing,
Bless the sovereign and his hearing.

The olfactory distastes of our monarch were not much unlike those of most men who possess the sense. The gustatory antipathies were those already mentioned, with the addition of oysters, fried fish, and "bad venison and worse wine." Lastly—

Both from bird-time and from pitch,
From the bristles of a hog,
Or the ring-worm in a dog,
From the courtship of a briar,
From St Anthony's old fire,
From a needle, or a thorn,
In the bed at e'en and morn,
Or from any gout's least grutching,
Bless the sovereign and his touching.

In this long nosology of nervous weaknesses we have only another proof of the constitutional infirmity which has already been attributed to the British Solomon.

Weldon informs us that James was "very witty, and had as many ready jests as any man living, at which he would not smile himself, but deliver them in a grave and serious manner." When a Scotch courtier complained to him that the English termed his countrymen beggarly, "Wait a little, man," said James, "and I will soon make them as beggarly as the Scots." Soon after his English accession, he was told of a cow which had been brought from Scotland into England, but, not liking her quarters, had found her way back into her own country. "My only wonder," said the king, "is how she contrived to get over the Border!" Once, being engaged in knighting some unworthy candidate for equestrian honours, who appeared very bashful, James said, "Nay, look up,

man: I have more reason to be ashamed than thou." The jests of those who sought to ridicule his profuse distribution of honours, are shamed by this self-accusing *mot* of the guilty man. Mr Phineas Pett, the king's ship-builder, was accused by some malignant persons of producing insufficient work. The king resolved to satisfy himself of the truth or falsehood of the accusation, and personally inspected some of the work. The wood was said to be cross-grained, but, on inspection, proved to be perfectly good, when James exclaimed, "Why, the cross-grain, methinks, is in Pett's accusers, not in his work." There is here little wit; but what there is, is on the side of truth—as is also the case with the following. Two gentlemen, noted for agility, trying to outjump each other in the king's presence, he said to the individual who jumped farthest, "And is this your best? Why, man, when I was a young man, I would have outleaped this myself." An old courtier, who stood by, thought this a good opportunity for making favour, and struck in with, "That you would, sir; I have seen your majesty leap much farther myself." "O my soul," quoth the king, as his usual phrase was, "thou liest. I would, indeed, have leapt much farther, but I never could so far, by two or three feet." "Thae folk," as the king said when the acclamations of his English subjects first rang in his ears, "wad spoil a gude king."

Such were a few of the traits of this oddity upon a throne—a man conspicuous by the accident of birth and situation, but who, if born in the humbler walks of life, would have never, in all probability, been more than a somewhat eccentric schoolmaster—very self-sufficient about his place and his learning, very frolicsome among the boys, and much noted by the ale-house fireside for his quaint sayings and his liking for cakes and ale.

PERILS OF BOYHOOD.

It is amazing how many perils one passes through, uninjured, in the season of boyhood. Few persons there are who can look back upon their early life without calling to remembrance various hairbreadth escapes, terrible in the retrospect, though almost unheeded at the time of their occurrence. If it should chance that any one has no such recollections connected with the period of his childhood, let him once marry, and have three or four boys, or even girls, running up and down his dwelling, and he will soon gain vicariously, or by proxy, a full sense of the infantine dangers and escapes alluded to, which it was not his fortune to acquire the knowledge of in his own person. If he does not, once a-day at least, become deeply convinced that the man would be a great benefactor to his species who could contrive to make a house comfortable without windows, fires, or stairs, why, then, he may think himself one of the most lucky of mankind. Nor are juvenile perils confined to the quarters hinted at. Every sharp-pointed instrument, every edge-tool, in domestic use, will prove a source of perpetual alarm to the parental eye. In an ode to his son, "aged three years and five months," Thomas Hood so admirably illustrates this point, that we cannot make the matter clearer than by quoting a portion of the piece.

Thou happy, happy elf!
(But stop—first let me kiss away that tear)
Thou tiny image of myself!
(My love, he's poking peas into my ear)
Thou merry, laughing sprite!
With spirits feather-light,
Untouched by sorrow, and unsoiled by sin
(Good heavens! the child is swallowing a pin!)
Light as the singing-bird that wings the air
(The door! the door! he'll tumble down the stair!)
Thou darling of thy sire!
(Why, Jane, he'll set his pinafore a-fire!)
Little epitome of man!
(He'll climb upon the table, that's his plan!)
Touched with the beautiful tints of dawning life
(He's got a knife!)
Thou pretty opening rose!
(Go to your mother, child, and wipe your nose!)
Balm and breathing music like the south
(He really brings my heart into my mouth!)
Fresh as the morn, and brilliant as its star
(I wish that window had an iron bar!)
Bold as the hawk, yet gentle as the dove,
(I tell you what, my love,
I cannot write, unless he's sent above!)

The preservation of little men and women, amid all these hazardous chances, shows the assertion of the poet, that "Heaven lies about us in our infancy," to be true in the most extended sense of the words. From a fall, which would seemingly have sent any of his full-grown contemporaries to the shades, a youngster of a few years' growth rises uninjured in lithe and limb. A tumble, that would lend any spectator to anticipate a flattened nose for life, only causes the young sufferer to scratch the member in question with an awkward look, hovering between crying and laughing, and easily determined the latter way by any passing incitement. It is with the animal as with the vegetable world. The sapling bends to the blast, and sustains no injury, when the gnarled oak is laid low. So is it with animals; and a happy provision of nature it is, that the physical constitution of human beings, at the period when they are least fitted to avoid injury, or to defend themselves against it, should be least accessible to hurtful impressions of any kind.

But a tithe of the casualties to which the defective knowledge and incautious fearlessness of young people, and of boys in particular, expose them, has not been enumerated, and, indeed, cannot be computed. A better exposition of the truth of this cannot, perhaps, be given, than by taking an individual case, and detailing the perilous accidents by flood and field which have fallen to the share of one person—the writer of these observations.

The first material danger, out of the route of ordinary and natural liabilities, to which it was my lot to be subjected, was one which occurred too far back to be within the reach of my own memory. My native place was on the Tweed, and our family dwelling so close to its waters, that the level green composing the bank of the river was resorted to as a proper place for drying and bleaching the linen of the household. One of its members was conducting this operation on one occasion, when I, then just able to walk, issued from the garden gate, and, seeing a well-known person on the green, proceeded without delay to join her. This would have been a very easy matter, had there not been a dam or mill-lead of considerable depth and strength of current between me and the green. A wooden foot-bridge formed the passage on common occasions, but the use and mystery of bridges then formed no part of my stock of acquired knowledge, and I plumped into the water. The person who had been with me in the garden, had, in the meantime, missed me, and, on issuing from the gate, beheld me rolling over and over, in rapid progress towards the end of the dam, where it debouches into the Tweed. Being lame, however, my late companion could do little else than call loudly to all within hearing. Before any one could come to the spot, I had been carried to the foot of the dam, a distance of a good many yards, and was in a fair way for a voyage down the main stream. But it chanced that a decent old man was engaged in watering his cow in the Tweed, near the place. He saw what had occurred, and rescued me from the waters in a guise which would have excited the strongest sympathies of the Humane Society.

A few more years had passed away, when a second accident, of a nature more unpleasant and equally dangerous, signalled my career. On the occasion of the drowning, those who had charge of me were to blame; but in this new affair I was in a measure a free and rational agent, and was receiving the due punishment for a fault. Being in the house of a relation, I found by chance a window open on the second floor, and naturally took advantage of the circumstance to stretch my head out, and to put myself, in short, into as great peril as possible. At a little distance below, there stood a decent old weaver, with his arms folded, his head uncovered, and his pipe in his mouth, luxuriously enjoying the mid-day interval of labour. As I marked the calm content of his attitude, the demon of boyish mischief suggested to me what glorious fun it would be if I could but let drop a small object on his head, and then retreat before he knew where it came from. The suggestion was not to be resisted. The consummate repose of the smoker was too provoking. Nobody was behind to prevent me. Once, a failure; twice, thrice, still unsuccessful. The man was too far off. Drawing back my mischievous person to increase the impetus, I made a fourth great effort. Whether the deed was accomplished at this trial or not, I cannot say; for, in making the attempt, I lost my balance, flew over the window, made a clean somersault, and came smack on the flag-steps below. The shock caused a temporary insensibility, but there was no material damage done. My kind relative, on whose premises the thing took place, cried, on seeing me senseless, "Aih, mercy on us, a' the teeth are knocked out o' the laddie's head!" Fortunately, this was not the case, and more fortunately still, I was no way lamed by the tumble. I shudder, however, when I think at this hour that a slight difference in the mode of that fall must have been fatal. The very height, by permitting a complete circumgyration, saved me.

The next accident of a serious kind which befell me, was of a very odd nature. Being accustomed to spend the school-vacation at a farm-house in the country, where a near relation lived, I was, of course, much about the stables and byres (places where the cows are housed and stalled) during that period. On one occasion, while playing with another boy, some six or seven years old like myself, it came into my head that I would enact the part of a cow—perhaps I might have enacted a calf more to the life. But a cow I would be, and for this purpose endeavoured to get hold of the iron chain with which the cows are loosely bound by the neck to the head of the stall. But, in the absence of the cattle, this chain was linked upon a high nail above my limited reach. However, I clambered up the sides of the stall, and, as I could not get down the chain to make a regular cow of myself by putting it round my neck, I put the open hook or link at the end of it into my mouth, and then thought myself, no doubt, as like a cow in its stall as could be, though in reality much liker that junior member of the cow community already alluded to. Scarcely had I been thus chained, when my foot slipped, and down I fell. The chain, though blunt, went right through my cheek, about half an inch from the left corner of my mouth. Fortunately, my feet just could touch the ground, and the chain was not forced by my weight to tear its way out. Here was a situation to be in! Extricate myself I could not, nor could my companion do it for me; so that I was compelled to undergo this novel species of hanging, with my neck stretched, and my head turned up sideways in the air like a jack-

* A street in London, where brass candlesticks were made; this manufacture being, of course, a noisy one.

† The people of Banbury were remarkable for puritanism.

daw looking at a silver spoon, until my comrade ran for assistance. I could not even enjoy the pleasure of crying or screaming, though it is probable that I did both abundantly when my kind old grandmother came and liberated me from my awkward position. Following her old-world ways, she washed the wound with whisky, I remember, and, be the proceeding wise or not, a rapid cure was effected. Here again I shudder when I think that if I had been alone, I might have been suffocated with blood; or what a tear would have been the consequence, if my legs had been a little shorter! The hole has left, as it is, only a mark that may pass very well in a crowd for a dimple. It may be called the mark of my second vaccination.

These are some of the most remarkable of the accidents that have fallen to my share, and they are surely pretty well for one individual. But these are not all. An occurrence, as ugly to look at as any of them, befell me shortly after my unfortunate attempt to make a horned nowt of myself. A horse had run away on the streets of my native town, and was causing a little stir. Seeing a crowd standing at the corner of a cross street, I made for the spot to learn all the whatabouts of it. As I approached the assemblage, I stumbled and fell, exactly while the horse was scampering up by another way. It passed over me, and, to the eyes of all men, set one or more of its feet upon my body. I lay stock still, and those who lifted me expected to find some part of my bodily configuration bruised to a jelly. But such was not the case. The horse had put one of its feet on my chest, but beyond a slight mark, no other result was visible. I remember perfectly that I did lie in bed for a day or so; not on account of any suffering, however, but because the sympathy of those around proved extremely palatable, coming in the shape of strawberry baskets and other such seasonable donations.

Not knowing exactly whether these sketches of individual experiences in the accident way may have much interest for the reader, I may bring them to a close, without descending to such minor events as tumbles from trees and the like, though some of these might seem perilous enough. It is not intended to attempt the extraction of any special moral from such reminiscences. If pages, in truth, were devoted to the attempt, what more emphatic conclusion could be arrived at than is contained in the brief sentence already quoted, "Heaven lies about us in our infancy;" which words have many shades of meaning, and one most applicable here.

LORD EXMOUTH.

ADMIRAL LORD EXMOUTH (formerly Mr Pellew) was noted in boyhood for an extraordinary degree of daring and spirit. "While he was a midshipman in the *Blonde*," says Mr Osler, in his *Life of the Admiral*, "he did the ship's duty with a smartness which none of them could equal; and as every one takes pleasure where he excels, he had soon become a thorough seaman. At the same time, the buoyancy of youth, and a naturally playful disposition, led him continually into feats of more than common daring. In the spring of 1776, General Burgoyne took his passage to America in the *Blonde*, and when he came alongside, the yards were manned to receive him. Looking up, he was surprised to see a midshipman on the yard-arm standing on his head. Captain Pownoll, who was at his side, soon quieted his apprehensions, by assuring him that it was only one of the usual frolics of young Pellew, and that the general might make himself quite at ease for his safety, for that if he should fall, he would only go under the ship's bottom, and come up on the other side. What on this occasion was probably spoken but in jest, was afterwards more than realised; for he actually sprang from the fore-yard of the *Blonde*, while she was going fast through the water, and saved a man who had fallen overboard. Captain Pownoll reproached him for his rashness, but he shed tears when he spoke of it to the officers, and declared that Pellew was a noble fellow."

The number of human beings whom he saved from death, by his personal exertions, in the course of his long career, is said to have been very great. Perhaps the most notable of all his actions of this order is the following:—"On the 26th of January 1796, when the *Indefatigable* was lying in *Hamoaze*, after having been docked, the *Dutton*, a large East Indiaman, employed in the transport service, on her way to the West Indies, with part of the 2d or Queen's regiment, was driven into Plymouth by stress of weather. She had been out seven weeks, and had many sick on board. The gale increasing in the afternoon, it was determined to run, for greater safety, to Catwater; but the buoy at the extremity of the reef off Mount Batten having broke adrift, of which the pilots were not aware, she touched on the shoal, and carried away her rudder. Thus rendered unmanageable, she fell off, and grounded under the citadel, where, heaving round, she lay rolling heavily, with her broadside to the waves. At the second roll, she threw all her masts overboard together.

Sir Edward (he had then been knighted) and Lady Pellew were engaged to dine on that day with Dr Hawker, the excellent vicar of Charles, who had become acquainted with Mr Pellew when they were serving together at Plymouth as surgeons to the marines, and continued through life the intimate and valued friend of all the brothers. Sir Edward noticed the crowds running to the Hoe, and, having learned the cause, he sprang out of the carriage, and ran off

with the rest. Arrived at the beach, he saw at once that the loss of nearly all on board, between five and six hundred, was inevitable, without some one to direct them. The principal officers of the ship had abandoned their charge, and got on shore, just as he arrived on the beach. Having urged them, but without success, to return to their duty, and vainly offered rewards to pilots and others belonging to the port to board the wreck, for all thought it too hazardous to be attempted, he exclaimed, "then I will go myself!" A single rope, by which the officers and a few others had landed, formed the only communication with the ship, and by this he was hauled on board through the surf. The danger was greatly increased by the wreck of the masts, which had fallen towards the shore; and he received an injury on the back, which confined him to his bed for a week, in consequence of being dragged under the mainmast. But disregarding this at the time, he reached the deck, declared himself, and assumed the command. He assured the people that every one would be saved, if they quietly obeyed his orders; that he would himself be the last to quit the wreck, but that he would run any one through who disobeyed him. His well-known name, with the calmness and energy he displayed, gave confidence to the despairing multitude. He was received with three hearty cheers, which were echoed by the multitude on shore; and his promptitude at resource soon enabled him to find and apply the means by which all might be safely landed. His officers in the meantime, though not knowing that he was on board, were exerting themselves to bring assistance from the *Indefatigable*. Mr Pellew, first lieutenant, left the ship in the barge, and Mr Thomson, acting master, in the launch; but the boats could not be brought alongside the wreck, and were obliged to run for the Barbican. A small boat, belonging to a merchant vessel, was more fortunate. Mr Edsall, signal midshipman to the port admiral, and Mr Coghlan, mate of the vessel, succeeded, at the risk of their lives, in bringing her alongside. The ends of two additional hawsers were got on shore, and Sir Edward contrived cradles to be slung upon them, with travelling ropes to pass forward and backward between the ship and the beach. Each hawser was held on shore by a number of men, who watched the rolling of the wreck, and kept the ropes tight and steady. Meantime a cutter had with great difficulty worked out of Plymouth pool, and two large boats arrived from the dockyard, under the direction of Mr Hemmings, the master-attendant, by whose caution and judgment they were enabled to approach the wreck, and receive the more helpless of the passengers, who were carried to the cutter. Sir Edward, with his sword drawn, directed the proceedings, and preserved order; a task the more difficult, as the soldiers had got at the spirits before he came on board, and many were drunk. The children, the women, and the sick, were the first landed. One of them was only three weeks old, and nothing in the whole transaction impressed Sir Edward more strongly, than the struggle of the mother's feelings before she would entrust her infant to his care, or afforded him more pleasure than the success of his attempt to save it. Next the soldiers were got on shore; then the ship's company; and, finally, Sir Edward himself, who was one of the last to leave her. Every one was saved, and presently after the wreck went to pieces.

Nothing could equal the lustre of such an action, except the modesty of him who was the hero of it. He would have assigned the whole praise to others in his report of this deed. But the truth was known, and the freedom of the town of Plymouth, and a service of plate from the Liverpool merchants, were voted to him in acknowledgment of the act.

A LONDON FOG.

MOST of our readers, we have no doubt, will have heard of that famous but foul congregation of vapours, called a London Fog, which, when it chooses to appear, casts a pall of thickest darkness over the Great Metropolis, changing day into night, and mystifying and confounding the myriads of human beings that dwell therein. This phenomenon, however, does not present itself every day, or even every year; it arrives only during certain states of the weather, and chiefly in winter, when the wind brings up the cold thick vapours from the German Ocean, and mingles them with the smoke of the metropolis. When the fog hangs over the streets to only a partial extent, there is produced a peculiar opacity in the air overhead, which is humorously but correctly defined as a "peas-soup atmosphere," from its resemblance to that dull yellow liquid. But when the fog arrives in all its force and substantiality, the atmosphere is beyond peas-soup pitch; and it is so dense and murky, that it may almost be felt and handled; and passengers on the streets can no more see through it than could fishes see through perfectly muddy water.

On the 23d of December 1818, London was enveloped in a fog, the most dense that had been witnessed for several years. The thickness of the vapour in the early part of the day was not so very great as to be attended with extraordinary inconvenience; but the opacity gradually increased, and in the city, where the fog is always the most dense, there was, about four o'clock, no possibility of discerning an object at the distance of a few paces. The carriages and waggons moving along the streets were not discoverable from the flag-ways, and the passengers on the latter derived very little aid from the lights in the windows, or from the lamps, as most of the shops, from fear of accidents, were shut, and the lamps afforded but a very feeble twinkling light, not visible until a near approach. The coachmen alighted from their boxes to lead

their horses, and the link-boys were in great numbers to offer their assistance; but with every possible care and precaution, the passengers, both on foot and in carriages, seldom succeeded in making their way without mistakes—and horses and carriages frequently deviated from the streets to the flag-ways, to the imminent danger of the foot-passengers.

The noises made by the people in the streets were frightful—some shrieking from terror when surprised by the sudden approach of a horse or a carriage; others calling out to their fellow-travellers to warn them of danger, or anxiously inquiring their way; and many whistling and singing to make known that they were approaching. In a number of cases, the company deserted their carriages, which remained stationary, the coachmen not knowing where they were. Various sums, from half-a-crown to ten shillings, were obtained by link-boys for conducting a carriage through a single street. Nor was the presence and influence of the dense accumulation of vapours felt only out of doors. In the theatres, the actors on the stage were barely visible to the audience; and even private houses, though closed, and well furnished with fires, were filled and darkened by this unwelcome visitant. Between eleven and twelve o'clock, however, the rattling of carriages which had regained the power of motion, indicated the departure of the fog, and by midnight the metropolis had nearly resumed the appearance usually presented by it at that hour. Many, many thousands, who had been surprised at a distance from home, were then able for the first time to make their way to their firesides, and rejoin their anxious and alarmed families.

The fog, while it lasted, afforded a golden opportunity to thieves and pickpockets, and of this they failed not to avail themselves. A most daring gang of thieves paraded Piccadilly, and committed extensive depredations on the public with impunity. About the hour of five o'clock, several ladies, who had hired a coach, alighted near the barracks at Knightsbridge, and in consequence of the intense fog, they employed a link-boy to light them as far as the Strand. While they were proceeding along near the Cannon Brewery, a dastardly fellow came up with a link blazing in his hand, and dashed it among the ladies, six in number, which threw them into the utmost confusion. The lighted stuff that was annexed to the link stuck to the ladies' dresses, and burned them very much. At this instant a great many persons came up, who attempted to save the females' dresses from burning, and cried shame at the fellow's wanton act. In the confusion, which was evidently created for the purpose of robbery, one of the ladies was deprived of a scarf, and several persons around also lost their property at the same moment. Various other depredations were committed about the same period, along Piccadilly and elsewhere. The different roads leading to Kensington, Hammersmith, and other suburbs, were rendered most dangerous by footpads. It was a benefit night for the coachmakers. A foreign gentleman driving through Temple-Bar, met a broad-wheeled waggon on the city side, which, coming in contact with his chaise, dashed it to pieces. Almost every street presented a similar misfortune. Two of the mails, passing along the Strand about seven o'clock, ran against each other, and were both stopped at a shock by the locking of the wheels. The coachman was thrown from one of them by the concussion, but escaped, fortunately, with a few bruises. There were various cases, nevertheless, where the injury was of a more deplorable character. Several persons were run over by carriages, and killed, in the attempt to cross streets.

These are but a few of the misfortunes attendant on a London fog. The robberies in shops and houses were without number. Thieves would enter a place of business, ask for some article under pretence of purchasing it, and in one instant snatch up something and make off with it. If they once got into the fog, pursuit was out of the question. Altogether, such a visitation can only be regarded as a most serious calamity to the metropolis.

THE DOGS OF TWEEDSMUIR.

THERE used formerly to be at the kirk of Tweedsmuir, in Peeblesshire, as many dogs as there were men, on account of the difficulty which the farmers and shepherds of that pastoral district had in preventing their dogs from following them. The dogs, in general, behaved pretty well, and lay below the seats; still, noisy quarrels among them sometimes took place, and on these occasions the minister had to order the beadle to turn out the disturbers of the peace. With these exceptions, they kept in tolerably good order till the congregation was going to disperse. From long attendance at church, they knew when this breaking up was about to take place. The signal for uproar was the rising of the minister in the pulpit to pronounce the blessing. As soon as he did so, they used to rush pell-mell to the door, barking and screeching for joy to be let loose, and therefore not a word could be heard. At length, the minister, honest man, bethought himself of a plan to get quit of these disturbances. He told the members of the congregation that it would be better for them all to keep their seats till the parting benediction was over, and then they would all rise and walk leisurely out. This was tried, and it did remarkably well; however, it happened one day that the minister of the parish was absent, and a stranger was in the pulpit, who, when he arose to pronounce the blessing after the last psalm, was surprised to see the congregation continue sitting, which is against all rule and custom. At last an old grey-haired shepherd called out to him, "On, just go on, sir, go on; we are only sitting a wee to cheat the dogs; but when you have done, we'll all rise and go out quietly."

In consequence of a press of matter, the second article of "Inquiries respecting Food" is postponed till our next number.

INQUIRIES RESPECTING FOOD. SECOND ARTICLE.

THE facts adduced in the former paper on this subject went to show that, in the case of aged paupers, and individuals under confinement with light or no labour, a certain moderate amount of aliment is best fitted to preserve health. It was shown that aged paupers could live in a certain degree of healthiness when fed with about twenty ounces of solids (about two of these being animal food) per day, but, when this food was a little reduced, mortality was greatly increased amongst them; and also that, in a house where the same class of persons had about thirty ounces of solids (three of these being animal food) per day, a much greater mortality resulted. Other circumstances were mentioned, all of them tending to show, that, above a certain point in the supply of aliment, the increase was accompanied by a corresponding increase of sickness and mortality. These facts are of considerable importance to all classes. If there be a healthy medium for aged unemployed persons of the humbler order, there must be a healthy medium for individuals of every description, and in all imaginable circumstances. How far this medium is exceeded in the case of the non-operative and affluent classes, and how far they consequently, though unconsciously, become liable to that increase of sickness and mortality shown to take place in overfed prisoners and paupers, is well worthy of being investigated—though it is not our purpose now to occupy ourselves with these questions.* What we are for the present most anxious about is—How far the food of the labouring classes squares with the medium calculated to give the greatest amount of health in their peculiar circumstances.

Here, it must be observed in the first place, we have to deal with an order of men in the prime of life, and subject to considerable bodily exercise, in many cases in the open air, so that the waste in their systems, and the consequent demand for nutriment, must be considerably higher than in the class of aged and unemployed paupers. We have few data for

ascertaining the amount of solids constituting the healthy medium in their case. We are, however, assured by excellent authority, that the prisoners at hard labour in the Edinburgh Bridewell live healthily upon thirty-one ounces of solids per day.* Probably, if we take this as a fair medium for men working as prisoners, and make a small extra allowance for the exposure to fresh air, and the greater mental stimulus of free labourers, we shall reach a proper allowance for adults of the latter class in thirty-two or thirty-three ounces of solids per day, part of this being animal food.

We are now to inquire if the operative classes do generally enjoy this amount of aliment, or even the lower amount of twenty-two ounces. Here it is unfortunately out of our power to present a very large array of specific facts; but yet we hope, by one means and another, to give a certain degree of satisfaction on the subject. The rural labourers, who constitute a very large portion of the whole community—probably a fourth—fall to be first considered. In Scotland, they are divided into three classes—young men who board in the farm-house and receive wages, married men who live as cottars and receive certain allowances in food and money, and women who work in the fields at certain seasons for a stated weekly pittance. Of these, the first may be considered as upon the whole well off, seeing that their employers are in some measure obliged to see them properly fed.† But the married farm-servants and their families do not fare so well. They generally have, besides their wages, a free cottage and piece of garden ground, with a right of pasturing a cow: the whole, we have been informed, is usually calculated as equal to about eleven shillings a-week. They in most instances have what appears a sufficiency of food, but it is almost exclusively of oat and barley meal, potatoes, milk, and cheese. Animal food is almost unknown in their houses. A very small piece of the annually killed pig is taken now and then to help out their vegetable diet—probably once a-week at the utmost—while many cannot afford even to use their own pork, and consequently see butcher's meat only by accident. The ploughman submits to this fare with a marked appearance of patience and content, for resignation has been inculcated upon him from his earliest days as a religious duty, and he probably supposes that the whole question is whether or not his palate shall be gratified. But, though content, he suffers nevertheless; the labour, not supported by proper food, is in some measure taken out of his natural strength; and the consequence is, that he *breaks down*, as it is called, at a comparatively early period of life, and, becoming unfit any longer to act as a ploughman, is obliged to leave farm-service. He now becomes an occasional or day labourer, probably at the roads, where he does not realise nearly so much as before; or perhaps he is altogether unfit for work, and obliged to depend on

the kindness of his children, or the stinted allowance of the parish. At the best, he is a prematurely exhausted and infirm man, in a more or less helpless situation. The female field-labourers, when employed, earn only eightpence a-day—they necessarily live in as sparing a manner as the married men-servants, and are unable to provide any thing for the future. Accordingly, ceasing to be fit for work about fifty, they inevitably become destitute, and have to depend for the remainder of their lives upon the charity of their neighbours or a parochial allowance. The number of such poor women in almost every small rural town in Scotland, is distressing to think upon. Though unfit for active exertion, their good constitutions, and the healthy air of their locality, give them a tenacity to life which usually carries them through many years of extreme penury. They obtain food but in mouthfuls, but still it is enough to keep in life. Habitual piety, as in the other case, gives them resignation, and even cheerfulness; but this ought not to blind any enlightened or humane inquirer to the real nature of their situation. The fact is, they live in a condition to which that of most domestic animals is luxury. The parish rarely offers to such persons more than a shilling a-week, and that offer is so clogged with conditions, and its receipt made so intolerable to all honest feeling, that it is as often rejected as taken. Individuals, on the other hand, occasionally give some scraps from their table to succour these poor old women; but this succour is very trifling. Sometimes they earn a few pence by knitting a pair of stockings. On making some inquiries lately as to their mode of life, in a particular town, we found it altogether a mystery. Nothing like the usually understood means of supporting life could be traced as within their reach. We found that some had not seen white money for years—and this was within a few miles of a wealthy city. The only chance for such persons seems to be an acute illness, for then some little attention is apt to be paid to them. But, generally, this is not the nature of their ailments. They take "sore legs," glandular swellings, ulcerous complaints, and other severe maladies, the unavoidable consequence of poorness of living, and usually quite incurable, their blood being too thin to allow the constitution to rally. And thus they linger on from year to year, in a state very nearly parallel to that of the worn-out male-labourers, till death reluctantly puts an end to their sufferings. When we contemplate this distressing picture of the rural labouring class, how painful a contrast it seems to form with the spectacle of the cottage brood of rosy white-haired children, which meets the eye in every part of the country, as well as that presented by any collection of youthful rustics at their sports on the village green. Burns, somewhere describing the hardships of the cottager's life, says that, nevertheless,

Sturdy o'lels and buirdly hixies
Are bred in sic a way as this is.

And it may be so. In childhood and youth, the condition of the rural class is not in general bad. Their food is of the light kind which agrees with the young, and all the other circumstances of their condition are healthy, and favourable to the development of great strength. But when they at length fall under the iron doom of severe labour, with unproportioned aliment, their case becomes very different; and the rosy children, athletic young men, and "buirdly hixies," come at length to be visited with severe and premature infirmities, and end by being as pitiable a spectacle, as they were originally a delightful one.

In England, according to the best knowledge we can gain, the condition of farm-labourers is not much different from what it is in Scotland. The stories which

* Overfeeding is not the only error to which persons in easy or comparatively easy circumstances are liable. Underfeeding is also, from various causes, by no means uncommon. Some, having the evils of excess very strongly impressed on their minds, run to the opposite extreme, particularly in the food which they order for their children. Others, from an undue desire of saving, pinch themselves and their families to an injurious extent. The pleasure of reflecting on their self-denial reconciles them to the privation, and they look no farther. These persons must be informed that the moral feeling will have no effect whatever in making up for the physical deficiency, or repairing its fatal consequences. They will get thin-blooded, and become liable to distressing ailments, and be cut off before their time, whether the privation be for a good or a bad end; nor will the saved money be of one-tenth the avail in patching them up, which it would have been in keeping them sound. Many persons, also, from a principle of self-denial, or other mistaken views, take too large a proportion of vegetable food, or adhere to it alone, and deny themselves variety. Now, all of man's teeth, except eight, are of the kind invariably found in animals which live on flesh; and the fair inference is, that he was in a large measure designed by nature to live on flesh too. He therefore contravenes nature, and subjects himself to all the appropriate punishments, if he does not eat flesh, and that in sufficient quantity. As for variety, it is perhaps one of the most important principles in dietetics. Nature itself points it out to us, by making a too frequent repetition of all except the simplest elements of diet disagreeable. Many things at one meal are not desirable, though neither is the principle of *one dish* altogether a sound one. What is wanted is a variation to a certain extent in the diet of one day from the diet of another day.* If this be attended to, a smaller quantity of food will preserve the same degree of health.

* The want of variety is a prevalent error in public asylums. The managers of such institutions might effect a great improvement in this respect, with little or no addition to the expense.

* On first entering the house, there is generally a slight falling off in the prisoners, apparently in consequence of the mere fact of the change. In a week or two, they settle into a very healthy state, and continue so generally for six months, when the confinement begins to affect them.

† In a southern district of Scotland, this class of farm-servants, having fourteen pounds a-year besides their board, are in general able to save a good deal of money, which they amass in banks, and which only their subsequent entrance upon the condition of matrimony dissipates. Cases are numerous of this class of men saving enough to stock small farms of their own, from which in time they advance to larger concerns, so that they ultimately take their place amongst the yeomen of the district. Indeed, a great number of the farmers of this district were originally farm-servants, or are the children of persons who were so.

are told of their frequent meals of bacon and solacing draughts of ale, refer to exceptions, not to the general rule. In harvest, and at other times when there is a pressure of work, the labourers may occasionally be treated in this manner; but the most of them live in cottages upon the same light fare as the Scottish married *hynds*. How can it be otherwise, for example, in the south of England, where the weekly wages of a farm-labourer rarely exceed ten, and sometimes are as low as eight and even seven shillings a-week? We had lately an opportunity of making personal inquiry into the subject in Cheshire, and satisfied ourselves that, in that district, the farm-labourer is as much a stranger to animal food (excepting milk), and lives in all other respects as poorly, and rears his family with as much difficulty, as the generality of the same class of men in the north. In 1833, when Mr Chadwick made the inquiries as to the food of convicts, soldiers, &c., which were specified in the former article, he found that the independent labourers enjoyed a much inferior amount of aliment—those within the range of his observation being enabled by their earnings to eat only 119 ounces of bread per week and three ounces of bacon—we presume, exclusively of the quantities required for a wife and average number of children. This is only at the rate of 17½ ounces of solids per day—considerably less than what is given by the public to aged paupers who have nothing to do. It was a general point of evidence with those called before the Poor-Law Commissioners in 1833, that the poorer class of rate-payers fared much worse than the inmates of the workhouse, inasmuch that, when once any one got a taste of workhouse life, and found it so much better than his ordinary one, he could rarely be induced to leave that asylum. Mr Drouet, the resident governor of Lambeth Workhouse, stated this very strongly with reference to the people about Gosport. He said he had often seen the poor rate-payer dining on potatoes, and that for days together, while the paupers had a comparatively sumptuous dinner. The very poor rate-payers, he said, hardly ever think of such things as beer and butter, except on Sundays. "I have known," said he, "a rate-payer, if he is a poor agricultural man, go out in a morning, with a bottle of milk and a piece of bread (perhaps a pound) made of flour with the bran in it, and when he returned home, he would expect a supper of potatoes, with a little skimmed milk thrown over it; this skimmed milk was perhaps given him by the neighbouring farmer. This is common," adds Mr Drouet, "about Gosport, and also in Bedfordshire and Northamptonshire." From the various accounts kept by shopkeepers with agricultural labourers, which Mr Chadwick had seen, he drew the fact, that, supposing the children to eat meat as well as the parents, the amount of that kind of food to each was not above four ounces a-week at an average; a sum much below what is due to health even in children. When the physicians examined the children in the St Cuthbert's Workhouse, last summer, and found so many of them suffering under ophthalmia and other diseases, one of the features of defective diet which they laid most stress upon was their getting rather less than an ounce of animal food per day.

The large class of artisans, as they realise higher wages, ought to be much better off than the rural labourers, and no doubt most of them enjoy sufficient food, while others, from mismanagement of their earnings, do not live any better, or so well, and subject their systems, moreover, to much gratuitous injury, as it may be called, by their use of spirituous liquors. The skilled factory labourers are, in general, able to provide themselves with a sufficiency of food, and do so; but the unskilled, who are the larger number, obtaining much smaller wages, can scarcely be in the same situation. Here, accordingly, there must be the same privations, and the same premature decay, as amongst the overtasked and underfed of the rural population. Labourers connected with the arts and manufactures have, moreover, this additional disadvantage, that they generally live in dense clusters, and in comparatively unhealthy situations. Wherever they are, there is sure to be gathered a refuse of their own and of all other classes, the indescribable poor and abject of a large city. Amongst these, or amongst themselves, arise epidemic distempers, from which all alike suffer greatly; for that poorness of body, uncleanness, and density, which have occasioned the disease, also disable them for overcoming it.

There thus appears considerable reason to believe that, in the most numerous class of our community, that of the unskilled labourers, rural and manufac-

turing, *underfeeding* prevails to a great extent. It is very desirable that the facts were thoroughly ascertained by extensive inquiry, and that its consequences were traced in a philosophical spirit through the labyrinth of our social condition. But in the mean time it is scarce possible to doubt that the evil does largely exist, and not only in times of scarcity, but at all times. Neither can we be at a loss to catch a general sense of the many evils which flow from it: We see one of them in a sufficiently alarming form, when, during some severe winter, labour being arrested and food scarce, the demon Fever takes possession of a large city, and decimates the poorer of its inhabitants. To make more plain what we mean, we may advert to the city of Glasgow, where, in 1837, there were twenty-one thousand cases of dangerous fever, being just about a tenth of the inhabitants; and these mostly took place during a season of scarcity amongst the poor. When such epidemics arise, though they are first occasioned by deficient food and comfort, and first seize those who are so circumstanced, they readily spread to the well fed and well clothed, who, while socially separated by an immense gulf, cannot help being locally near. Then it is that we see lives fall, to redeem which, in the hour of peril, physicians would and could be given, as readily as the physician's fee—fathers snatched away from the midst of their youthful families, or sons or daughters, perhaps sole children, removed from the presence of the most loving of parents—all this from no failure in the individuals concerned to obey the laws of health, but merely because hordes of their fellow-creatures do not enjoy the aliment which nature has declared to be necessary. Nor are these the only evils which the wealthy or easy suffer from the co-existence of an underfed class. Where any large portion of the community is in this predicament, there must be moral as well as physical diseases. "The pressure of poverty," says an eminent writer, "is unfavourable to the growth of refinement and morality; and crime and turbulence are never so much to be dreaded as during times of scarcity, and manufacturing or agricultural distress. Bodily health, satisfied appetite, and peace of mind, are great promoters of individual morality and public tranquillity; and whenever these are encroached on in any great class of the community, discontent and crime are sure to follow. In legislation, this principle is seldom attended to, and laws are consequently enacted merely for the suppression of the result, while the source from which it springs is left altogether unnoticed, and in the fullest activity."* It may be added, that, where children are underfed, as they are in many public asylums, as well as in the houses of their indigent parents, a fourth and spreading evil results, for from these children afterwards arises a wider circle of human beings, who inherit their weakness of body and mind, and in turn give rise to still wider circles, characterised by the same imbecilities, and who are ever ready to become the recipients and communicators of epidemic disease.

To ascertain the healthy medium of aliment, and inquire if the people at large are fed up to that point, are philosophical matters which we have conceived ourselves at liberty to investigate. As far as we can judge of our own motives, we make these investigations in the spirit of science, and with the proper object of all science in our view, namely, the improvement of the happiness of the people. If we have produced any conviction in the public as to the two points in question, we must have done much good, for it is impossible that such a conviction can exist in so enlightened and so humane a community as that of Britain, without leading more or less immediately to good results. The forms of philanthropy in our country are numberless. A list of the charitable societies in London alone, is of wearisome length. The sick, the blind, the aged, are all cared for. The negroes in our colonies call up our sympathies. The aborigines of less intimately connected settlements are the subjects of benevolent feeling. There are even statutes to protect the sensations of beasts of burden. Can we doubt, in such circumstances, that a deficiency of aliment in a large section of our industrious community, if such shall be proved to exist, will fail to prompt measures for its correction? Fully to investigate the causes of the existing evils, and their most likely remedies, would be inappropriate here, as it could not fail to lead us upon ground which is denied to us by the nature of our paper. We are only able to advert to one or two points, which the bulk of our readers will probably think of minor importance, though in this they may not be strictly correct. We think, then, that much improvement in the food of a vast number of individuals might be effected by a better economy of their means. Prosperous or non-prosperous, England spends twenty-four millions per annum on the single article of gin, which, instead of tending to compensate for low diet, aggravates its effects. Can we doubt that every aggression which moral forces can make upon this mass of error must add to the real comfort of the people? Even when the money of the labouring classes is laid out on more salutary articles, it is apt to be disposed of in an unthrifty manner. From improvidence and ignorance,

these classes both buy and cook their victuals under great disadvantages. We are forcibly impressed with this conviction when we learn how far money goes, under enlightened and systematic management, for the support of the poor. In workhouses, where, as already seen, the food is better than that enjoyed by many independent labourers, the weekly cost for each person is usually very small—in Edinburgh less than 1s. 6d. per week, in Manchester 2s. 4d., and scarcely any where above 3s. The daily dinner of the 420 inmates of the Edinburgh city workhouse (exclusive of bread) costs only about 16s.; and a few years ago, an individual made a profit for himself by contracting to furnish the people in the Gosport workhouse in food and clothing, and pay all the expenses of the establishment except rent and taxes, for 2s. 6d. a-head weekly—the fare being to all appearance both abundant and good. It is impossible, of course, for a single family to furnish itself as cheaply as a large number; but still the above facts go far to prove that the earnings of poor families must in many cases be ill managed, and might be made to go farther. As far as the evil lies here, we may of course hope that the progress of the temperance cause, and of education, will effect good. With regard to other sources of the evil, we must leave them to be investigated elsewhere.

MR SCROPE'S ART OF DEER-STALKING,

ILLUSTRATED BY MESSRS. LANDSEER.*

This large and beautiful volume belongs to a class of books whose titles are calculated to have the same startlingly cheering effect as the pronunciation of such words as *Twelfth Night* in England, or *New-Year's Day* in Scotland, or the *Twelfth* of August in either England or Scotland, is apt to have. It takes us instantaneously from the dust, the care, the struggles, and the weary drudging monotony of this intolerably industrious world, and places us all at once by the side of green nature, at leisure, in peace, and in a refreshing coolness and ease. The effect is like that of going home from school for the holidays, books being all for the time tossed to any where. Many of our readers will require to be informed that deer-stalking is an art still practised in the Highlands of Scotland, amidst the wide-spread moorish and mossy solitudes which have there come in place of the ancient forests. The deer is still to be found in those regions in considerable numbers; but it is an animal of an extremely watchful and easily alarmed character, so that infinite stealthiness is required in those who would bring it down with the rifle. Hence deer-stalking becomes a profession, or, in the other circumstances, a sport, of great nicety, and one by which considerable local distinction is to be gained. Of late years it has been occasionally practised by young men of fashion—the class to which Mr Scrope appears to belong—but always in connection with native sportsmen of humbler rank. In the present work, its whole mysteries are treated of, as practised in the district of Athole, and many personal adventures are related in that pleasant manner which a book referring to field-sports can scarcely fail to assume.

In the chapter on the Necessary Qualifications for a Deer-Stalker, we find that he must be a patient, abstemious, and hardy person, to a degree which would forbid nine out of ten to attempt it, besides having all the following requisites:—"Your consummate deer-stalker," says Mr Scrope, "should not only be able to run like an antelope, and breathe like the trade-winds, but should also be enriched with various other undeniable qualifications. As, for instance, he should be able to run in a stooping position, at a greyhound pace, with his back parallel to the ground, and his face within an inch of it, for miles together. He should take a singular pleasure in threading the seams of a bog, or in gliding down a burn, *ventre à terre*, like that insinuating animal the eel—accomplished he should be in skillfully squeezing his clothes after this operation, to make all comfortable. Strong and pliant in the ankle, he should most indubitably be; since in running swiftly down precipices, picturesquely adorned with sharp-edged, angular, vindictive stones, his feet will unavoidably get into awkward cavities, and curious positions; thus, if his legs are devoid of the faculty of breaking, so much the better—he has an evident advantage over the fragile man. He should rejoice in wading through torrents, and be able to stand firmly on water-worn stones, unconscious of the action of the current; or if by fickle fortune the waves should be too powerful for him, when he loses his balance, and goes floating away upon his back (for if he has any tact, or sense of the picturesque, it is presumed he will fall backwards), he should raise his rifle aloft in the air, *Marmion* fashion, lest his powder should get wet, and his day's sport come suddenly to an end. Steady, very steady should his hand be, at times wholly without a pulse. Hyacinthine curls are a very graceful ornament to the head, and accordingly they have been poetically treated of; but we value not grace in our shooting jacket, and infinitely preferring our man, like Dante's *Frati*, *che non hanno coperto il pelo al capo*, because the greater the distance from the eye to the extreme point of the head,

* Dr Combe on Digestion and Dietetics.

* Murray, London.

so much the quicker will the deer discover their enemy, than he will discover them. His pinnacle, or predominant, therefore, should not be ornamented with a high finial or tuft. Indeed, the less hair he has upon it the better. I leave it to a deer-stalker's own good sense to consider whether it would not be infinitely better for him to shave the crown of his head at once, than to run the risk of losing a single shot during the entire season. A man so shorn, with the addition of a little bog earth rubbed scientifically over the crown of his head, would be an absolute Ulysses on the moor, and (other things alike) perfectly invincible."

In imitation of Franks's Northern Memoirs, an angling-book of the time of the Commonwealth, Mr Scrope has partly given his book a colloquial form, some of the persons introduced being invested with fictitious names. Thus he himself is Tortoise, while a friend and learner bears the appellation of Lightfoot. The inferior persons who attend the party, and whose stores of native anecdote and shrewd sayings help the book considerably, rejoice in their proper ordinary names of Peter Fraser, Sandy, Harry, &c. These things being premised, the reader will understand the following piece of a deer-stalking adventure, which we present as a pretty fair specimen of the work, though only what is technically called a "quiet shot." MacLaren having descried a hart, the party, after doffing their caps, "advanced, sometimes on their hands and knees, through the deep seams of the bog, and again right up the middle of the burn, winding their cautious course according to the inequalities of the ground. Occasionally the seams led in an adverse direction, and then they were obliged to retrace their steps. This stealthy progress continued some time, till at length they came to some green sward, where the ground was not so favourable. Here was a great difficulty; it seemed barely possible to pass this small piece of ground without discovery. Fraser, aware of this, crept back, and explored the bog in a parallel direction, working his way like a mole, whilst the others remained prostrate. Returning all wet and bemired, his long serious face indicated a failure. This dangerous passage then was to be attempted, since there was no better means of approach. Tortoise, in low whispers, again entreated the strictest caution. "Raise not a foot nor a hand; let not a hair of your head be seen; but, as you value sport, imitate my motions precisely: everything depends upon this movement. This spot once passed successfully, we are safe from the hinds." He then made a signal for Sandy to lie down with the dogs; and, placing himself flat on his stomach, began to worm his way close under the low ridge of the bog; imitated most correctly and beautifully by the rest of the party. The burn now came sheer up to intercept the passage, and formed a pool under the bank, running deep and drumly. The leader then turned his head round slightly, and passed his hand along the grass as a sign for Lightfoot to wreath himself alongside of him. "Now, my good fellow, no remedy. If you do not like a ducking, stay here; but, for heaven's sake, if you do remain, lie like a flounder till the shot is fired. Have no curiosity, I pray and beseech you; and speak, as I do, in a low whisper." "Pshaw, I can follow wherever you go, and in the same position too." "Bravo; here goes then. But, for heaven's sake, do not make a splash and noise in the water, but go in as quiet as a fish, and keep under the high bank, although it is deeper there. There is a great nicety in going in properly: that is a difficult point. I believe it must be head foremost; but we must take care to keep our heels down as we slide in, and not wet the rifles. Hist, Peter: here, lay the rifles on the bank, and give them to me when I am in the burn." Tortoise then worked half his body over the bank, and, stooping low, brought his hands up on a large granite stone in the burn, with his breast to the water, and drew the rest of his body after him as straight as he possibly could. He was then half immersed, and, getting close under the bank, took the rifles. The rest followed admirably. In fact, the water was not so deep as it appeared to be, being scarcely over the middle. They proceeded in this manner about twenty yards, when, the ground being more favourable, they were enabled to get on dry land. "Do you think it will do?" "Hush! hush! he has not seen us yet; and yonder is my mark. The deer lies opposite it to the south: he is almost within gunshot even now." A sign was given to Peter Fraser to come alongside, for they were arrived at the spot from which it was necessary to diverge into the moss. In breathless expectation they now turned to the eastward, and crept forward through the bog, to enable them to come in upon the flank of the hart, who was lying with his head up wind, and would thus present his broadside to the rifle when he started; whereas, if they had gone in straight behind him, his haunches would have been the only mark, and the shot would have been a disgraceful one. Now came the anxious moment. Every thing hitherto had succeeded; much valuable time had been spent; they had gone forward in every possible position; their hands and knees buried in bogs, wreathing on their stomachs through the mire, or wading up the burns; and all this one brief moment might render futile, either by means of a single throb of the pulse in the act of firing, or a sudden rush of the deer, which would take him instantly out of sight. Tortoise raised his head slowly, slowly, but saw not the quarry. By degrees he looked an inch higher, when Peter plucked him suddenly by the arm, and pointed. The tops of his horns alone were to be seen above the hole in the bog; no more. Fraser looked anxious, for well he knew that the first spring would take the deer out of

sight. A moment's pause, when the sportsman held up his rifle steadily above the position of the hart's body; then, making a slight ticking noise, up sprang the deer; as instantly the shot was fired, and crack went the ball right against his ribs, as he was making his rush. Sandy now ran forward with the dogs, but still as well concealed by the ground as he could manage. "By heavens, he's off, and you have missed him; and here am I, wet, tarred, and feathered, and all for nothing; and I suppose you call this sport. If you had killed that magnificent animal, I should have rejoiced in my plight; but to miss such a great beast as that! Here, Peter, come and squeeze my clothes, and lay me out in the sun to dry. I never saw so base a shot." "Hush, hush! keep down. Why, the deer's safe enough, Harry." "Truly I think he is, for I see him going through the moss as comfortably as possible." "We must loose a dog, sir, or he will gang forrat to the hill." "Let go both of them; it will be a fine chance for the young dog; but get on a little first, and put him on the scent; the deer is so low in the bog that he cannot see him." Fraser now went on with the hounds in the leash, sinking, and recovering himself, and springing from the moss-hags, till the dogs caught sight of the hart, and they were slipped; but the fine fellow was soon out of the bog, and went over the top of the Meallowr. All went forward their best pace, plunging in and out of the black mire, till they came to the foot of the hill, and then with slackened pace went panting up its steep acclivity. "Now, Sandy, run forward to the right, if you have a run in you, and get a view with the glass all down the burn of auld Heclan, and then come forwards towards Glen Deery, if you do not see the bay there. Come along, Harry; the deer is shot through the body I tell you." "Sanguie di Diana! what makes him run so, then?" "Hark! I thought I heard the bay under the hill. No; 'twas the eagle; it may be he is watching for his prey. Hark again; do you hear them, Peter?" "I didna hear naething but the pleva; sure he canna win farther forrat than auld Heclan; he was sair donnered at first, but he skelped it bravly afterwards: we shall see them at the downcome." True enough they did; for when they passed over the hill to the south, the voice of hounds broke full upon them, and they saw the magnificent creature standing on a narrow projecting ledge of rock within the cleft, and in the mid course of a mountain cataract; the upper fall plunged down behind him, and the water, coursing through his legs, dashed the spray and mist around him, and then at one leap went plumb down to the abyss below; the rocks closed in upon his flanks, and there he stood, bidding defiance in his own mountain hold. Just at the edge of the precipice, and as it seemed on the very brink of eternity, the dogs were baying him furiously; one rush of the stag would have sent them down into the chasm, and in their fury they seemed wholly unconscious of their danger. All drew in their breath, and shuddered at the fatal chance that seemed momentarily about to take place. Fortunately the stag (sensible perhaps of the extreme peril of his own situation) showed less fight than wounded deer are apt to do; still the suspense was painfully exciting, for the dogs were wholly at his mercy, and as he menaced with his antlers, they retreated backwards within an inch of instant dissolution. "For heaven's sake, Lightfoot, stay quietly behind this knoll, whilst I creep in and finish him. A moment's delay may be fatal: I must make sure work; for if he is not killed outright, deer, dogs, and all, will inevitably roll over the horrid precipice together. Ah, my poor gallant Derig! Tortoise crept round canny, cannily towards the fatal spot, looking with extreme agitation at every motion of the dogs and deer; still he dared not hurry, though the moments were so precious. Of the two dogs that were at bay, Derig was the most fierce and persevering; the younger one had seen but little sport, and waited at first upon the motions of the older, nay, the better soldier; but his spirit being at length thoroughly roused, he fought at last fearlessly and independently. Whenever the deer turned his antlers aside to gore Tariff, Derig seized the moment to fly at his throat, but the motions of the hart were so rapid that the hound was ever compelled to draw back, which retrograde motion brought him frequently to the very verge of the precipice, and it was probable, that as he always fronted the enemy, he knew not, or in the heat of the combat had forgotten, the danger of his situation. The stag at length, being maddened with these vexatious attacks, made a desperate stab at Derig, and in avoiding it the poor dog at length lost his footing; his hind legs passed over the ledge of rock, and it now seemed impossible for him to recover himself. His life hung in the balance, and the fatal scale appeared to preponderate. Still his fore-legs bore upon the ledge, and he scraped and strove with them to the utmost; but as he had little or no support behind, he was in the position of a drowning man, who attempts to get into a boat, and being also like him exhausted, the chances were considerably against him. In struggling with his fore-legs, he appeared to advance a little, and then to slip back again, gasping painfully in the exertion; at length he probably found some slight bearing for the claws of his hind-feet, and, to the inexpressible relief of every one, he once more recovered his footing, and sprang forward at the deer as rash and wrathful as ever. Tortoise had at length gained the proper spot—the rifle was then raised; but when all hearts were beating high in sudden and nervous expectation of a happy issue, the dogs were unfortunately in such a position that a shot could not be fired from above without risk to one of them, and the danger was fear-

ful as ever. Three times was the aim thus taken and abandoned. At length an opening: the crack of the gun was heard faintly in the din of the waterfall; the ball passed through the back of the deer's head, and down he dropped on the spot, without a struggle."

THE BLIGHTED ONE,

A TRUE TALE.

As I advance in life, I am sensible that the recollections of my early days revive more strongly every hour, and those departed friends whose converse charmed, and whose powers of mind instructed, my youth, live again continually before me, and seem to cheer my solitary home. Sometimes the image of one favourite companion of my youthful hours predominates over the rest—and such a one has for some time past exclusively haunted my memory.

This friend possessed the art of story-telling, or "l'art de raconter," as the French call it, in so superior a degree, that I am now going to do what I ought to have done years ago, and indulge myself by putting down on paper the last of his true histories which I heard him relate. I believe my memory has retained it unimpaired, because the strong interest which it excited served to preserve it from decay, as gums preserve, unhurt by time, the bodies of the dead.

Perhaps my readers will not be as pleased with the tale as I was when I heard it—if so, I only wish they had heard my old friend relate it himself. I wish they had seen his folded arms, his sometimes glistening eye, his occasional and graceful action, and, above all, had heard the varied inflections of his deep melodious voice, as he related to his attentive auditors the tale of THE BLIGHTED ONE.

He was a great traveller, and on his return from one of his summer excursions, I expressed my hopes that he had met with something worth relating. "I think I have," he replied, with a benevolent smile; "but, like our friend Sancho, I must not be interrupted when I once begin, or I cannot go on. I must be sure you are not expecting any one else this evening." We told him we expected no one. Immediately folding his arms, and leaning his head against the wainscot, he began his narrative.

"You know," said he, "that I always ride on the outside of a stage-coach from taste, as well as from economy—because I love to see as much of the landscape as I possibly can; and I try to sit next the coachman, because he knows not only to whom the seats we pass on the road belong, but can sometimes tell one interesting anecdotes of the owners themselves—so I am sure of being entertained on my journey if so placed, at least as long as the many glasses of spirits which my companion thinks it right to drink on the way, have not marred his powers of description."

Well, I was so fortunate on my last journey from London to C— as to get my favourite seat, and it was next an unusually pleasing driver. I found he was a family man—had a wife he seemed fond of, and one child, a little boy, whom he was afraid of losing; and as he saw that I sympathised in his feelings, he was the more disposed to gratify my curiosity. At length, after a very prosperous journey, we saw the abbey church of C— in the distance, and we were not long in reaching the inn.

When the coach was about to stop, my attention was drawn towards an elderly woman, meanly but neatly clad, who was looking up to the coach with an expression of anxious impatience in her eye, which forcibly interested me.

The coachman saw her also, and dashing away a tear, said, "Ah! poor soul! there she is again, and there she has been every day for years; and now that I am a parent myself, and an anxious one too, I feel the more for her." This speech increased my interest in the poor woman, who, now that the coach had really stopped, and the passengers were getting down, drew quite close to the wheels, and looking up in the coachman's face with an expression which evidently unmanned him, said in a hurried voice, "Is he come to-day?" "No, dear soul!" he replied, "but he will come to-morrow, you know!" "Yes, yes," said she, "he will come to-morrow!" She then hurried down the street, followed by a respectable young woman, who shook her head mournfully at the driver as she turned away.

I had paid all demands upon me, and might have gone in search of a place to N—, but I could not stir till I had an explanation of what seemed so interesting to a sentimental traveller like myself, and I asked the coachman if I might speak a few words to him. "I see what you want to ask," he replied; "and as soon as I have done all my duty here, I will walk with you to the inn where the other coach starts from."

I thought him a long time about his duty, but at last he joined me, and we walked down the street together. "You want to know all about that poor woman," said he. "Indeed I do." "It is a sad story, sir:—She and her husband, respectable little tradespeople, had one child, and a fine lad he was; but he was more fond of play than work, and his father was

* One of the greatest improvements of the present day is that in Stage-coachmen, who are now patterns of sobriety, and have learnt to know their worst enemies are glasses of spirits.

a severe man. His mother doated on him, poor soul! and he loved her dearly. But not to be lengthy: when he was eighteen, poor Willie did something, I do not know what exactly, which put his father in a great rage, and in spite of his wife's tears and prayers, he struck his son, and turned him out of doors. I have always heard the poor lad did not deserve it; certain it is that he was wrong in one thing: he told his father he saw him for the last time, for he would never come back to be struck again! And he enlisted directly, and left C— with the soldiers.

Oh! the agony of the poor father when he had slept on his rage, and rose the next morning! The poor mother had not slept at all, and they both went in search of their now pardoned son. But he was gone! And by a very affecting letter to his mother, they learnt that he was ordered to the West Indies! and they were not rich enough to effect his discharge! So he sailed, and it broke his father's heart.

On his deathbed he left loving messages and his blessing to his poor boy, and said he died of a broken heart, from the recollection of his harshness to him.

Well, time went on, and the poor widowed mother might be said to live only for and in letters written by Willie; and every letter was full of love and piety. At last came a letter from him to say he had been at death's door with a bad fever, and was so weak still after it, that the medical men had ordered him home, as his only chance of life.

"Oh! I shall nurse him well again!" the poor mother said, all fear lost in the delight of having him restored to her; and when the time came for the vessel's being due in which he sailed, busy as a bee was she in preparing for his coming.

At last he wrote to say he was landed, that he had almost recovered his health and strength in the voyage, and should be at C— on such a day. That morning the poor mother went to the coach-office long before the hour announced the approach of the stage. It came, but she could not see her son on the outside; perhaps he was inside, and she ran eagerly forward to look in at the window, but he was not there. "Where is he! Where is my boy?" she cried to the driver, who had not as yet observed her. Now, sir, that driver was a good sort of man enough, but he did not understand a parent's feelings; and what do you think he replied! "Your son! poor soul! he is not come indeed!" "But he will come to-morrow, then; is there not a letter to say so?" "No, mistress; your poor son will come no more! He fell off the coach coming from Portsmouth to London, and was killed on the spot!"

I, a little boy then, was present at this scene, and never shall I forget the shriek with which she repeated the word "killed!" and then fell back as if it had struck her to the heart! She was carried home insensible, and we all hoped she would never recover. But it was ordered otherwise. She recovered to life the next day, but not to reason; for the first words she uttered were, "I must get up and dress myself, or I shall not get to the coach in time to meet Willie!" And, finding she was able to dress herself and walk as usual, her niece, who lived with her, she whom you saw to-day, let her go out, and she reached the coach as the horn blew. Oh! it was very affecting to see that poor bereaved creature go up to the coachman and ask again if her son was come! The driver that day was a neighbour of hers, and, having heard the tale, he replied kindly and cleverly, "No, he is not come to-day, but perhaps he will come to-morrow." "Yes, yes," she replied with a smile that wrung the heart, "he will come to-morrow," and away she hurried. And, sir, she has come to that coach-office, and asked the same question, received and repeated the same answer, for, as I told you to-day, many many years! "But surely, sir, she does not suffer much, does she?" "I trust not," I replied; "and this hope born of despair is, probably, the merciful ordering of Divine Providence for her relief." "Ay, so I think," he replied; "but, heaven bless you, sir! here is your coach, and it is now setting off." "I hope we shall meet again," I said, shaking him by the hand, and off we drove.—But it is late (added my friend), and I must defer the rest of my story, for it has a sequel, till to-morrow; and we unwillingly let him depart.

He came again early the next evening; we were alone, and he resumed his narration.

"Well, I went on to N—, and at the end of a week I returned to C—, and the three-horse diligence, by which I then travelled, went to the same inn as the London coach, and we reached it just as the horn of the latter was heard in the distance, and, waiting at her accustomed place, was the poor bereaved mother.

Again I heard the eager question, and the kindly spoken and well-meant reply. I saw the hope renewed which was, I knew, to end again in at least temporary despair. And, impelled by a feeling which I could not resist, I followed her and her companion to their dwelling. But I would not tap at the door till I had given them time to settle themselves again, and then I gently

knocked. The niece, a woman of a very benevolent countenance, opened it, and asked me to walk in, like one used to see callers, who came probably from the same motives as I did. Her aunt was sitting by the fire, and busy knitting, moving backwards and forwards with a seesaw motion of her body, which, I thought, was accelerated as she glanced her wild eyes over me. I bowed courteously, taking off my hat as I did so, for I felt myself in the 'venerable presence of misery,' as Sterne calls it; but she scarcely bowed in return, and seemed evidently to forget I was present. I therefore turned to ask questions of her niece, beginning by saying that I knew her poor aunt's story.

She readily answered me, and told me what an amiable lad Willie was; and had his father, as she said, been more kind to his little faults, he might have been alive and doing well. But he was not, and he drove Willie away. "Oh, sir," cried she, "what a scene of sorrow and remorse I saw, when they found the poor lad was gone past recall! Sorrow is bad enough, but remorse is far, far worse to see. Well, it broke his poor father's heart, and as he forgave his son, I hope God forgave him!" Here there was such a degree of increased movement in the poor sufferer, that I felt afraid she understood what we were saying, and begged the niece would speak lower. She told me that she had tried, in very bad weather, to keep her aunt from going to the coach, but that it brought on such a fit of phrensy that she dared not do it again; and I hope it will please the Almighty to take her," she added, "when she grows too infirm to move." "Does she always knit?" "Yes, sir, and all she does is against Willie comes; stockings, comfortable—she is always employed about him. See, sir—(opening a drawer)—all the drawers are filled with her work, and the kind neighbours get them sold for her, as she does not miss them, and that helps to get her many little comforts." "Does she like to have money given her?" "Yes, and all she gets, she says is for him." I then took out a piece of money—"Give it to her yourself," said the niece; and when I offered it, she snatched it eagerly and said, "ay, for him—yes, yes!"—looking up in my face with a sort of smile of woe—"he will come to-morrow!" Then, starting up, she put it below a little black shade of her son which hung up over the chimney-piece, the frame of which she had decorated with flowers, and all the bits of finery she could find.

I felt so interested in 'this stricken deer,' that I wanted to multiply question on question, especially as I was so much attracted by the feeling and right mindedness which all the niece's answers showed. I thought I should weary her, but I allowed myself to ask one question more, and that was, where the young man had been buried; and she was telling me all about the accident, when it was evident that the poor aunt went backwards and forwards in her chair in evident agitation, murmuring to herself, 'yes, yes, he will come to-morrow, he'll come to-morrow!' And fearing that I had done harm, I hastily withdrew, telling her I trusted we should meet again.

This circumstance convinced me still more of what I had before suspected, that maniacs, whom nothing can prevail upon to speak, and who seem to know nothing, understand all that is said, and therefore have their feelings often unnecessarily wounded, and I really felt like a criminal when I left the poor woman's house.

From C— I returned home." "And never told us this tale before!" cried I; "how could you be so unkind?" "I never had an opportunity; but let me finish it now—I have not done yet. This summer I went north again, and always intending to get to C— at last, I wished to arrive there just as the London coach should come in; but I was too late, and I saw my friend the driver walking up the street, all his duties over for the time. My first question was for his sailing boy. It was quite well, and he and his wife so happy and thankful, he said. 'And the poor widow!' 'You will be glad to hear,' he replied, in a serious and solemn tone, 'that she is no more. She died a few days ago, and she is to be interred this evening!'

For a moment I was disappointed, for I had reckoned on seeing her again, but the next minute I rejoiced in her release; and having expressed my wish to go to the house, and attend the funeral, my friend encouraged me to do both, assuring me that her excellent niece would be gratified by it. Accordingly I went, and found two or three men and women in mourning, sitting with the niece in the room below. The latter was affected at seeing me, and, as if divining my wishes, she said, 'Would you like to see her, sir! the lid is not yet screwed down,' and I followed her into the chamber of death. 'She makes a sweet corpse, sir!' said she, unveiling the face of the dead. 'She does indeed!' 'She looks like herself now, sir, for she was a very handsome woman before she knew sorrow! Dear me! when the last blow came upon the others, it seemed to wither her up at once like! Her dark hair was all grey in no time! It seemed as though a blight had come over her!' 'Ay, indeed she was a blighted one!' replied I; 'but she is now where the weary are at rest.' 'No doubt,' she answered, tears trickling down her cheeks as she spoke; 'and what a blessed thing it was, sir, that she knew her Creator in the days of her youth, for she was prevented all preparation for her latter end in one moment!' 'Did she recover her senses before she died?' 'In death I think she did; she was seized suddenly with fainting fits, and for two days went from one into another, but the third day she recovered from them entirely, and hearing the well-

known horn, she started up in the bed, said she must rise and dress, or she should be too late at the coach; and she made an effort to get up, but, with a mournful look, fell back again. A change came over her countenance, and, looking round at those nearest her bed, she seemed to be seeking for some one whom she could not find; and somehow we thought that the whole truth came over her mind in a moment; for she clasped her hands together, and looked up to heaven with such a piteous face! Then saying with great effort, 'Mercy! Lord Jesus!' she fell back with a sigh, and all was over!"

And all was over, and there she lay before us in the solemn stillness of death, whom I had so lately seen in restless, and probably at times, in *indescribable* suffering! and I gazed upon her pale and placid face with even pleasurable emotion.

'Sir,' said the niece, 'do you not think she is now reunited to her child! Oh! sir, what a joyful meeting must theirs have been! Tell me, sir, do you not believe that we shall meet those we have loved in another world?' 'I do indeed believe it,' I replied, 'and I trust she now knows the truth of this belief; however, be that as it may, she is where the tears are wiped away from all eyes.' 'Yes,' she falteringly replied, 'and she is joining, I trust, the song of the redeemed.'

It was now time to close the coffin; so, having given a last look to the unconscious dead, I left the niece alone to gaze her last also, and ran out of the house.

It was a fine spring evening when my friend the coachman, and myself, joined the funeral procession. There were many followers, for the story was known, and the afflicted woman, who had always been an object of general respect, had become one of general pity; and many strangers, like myself, had been induced to see her carried to her last home.

Many of the graves in the churchyard to which we bore her were covered with primroses and violets—a new sight to me. It was full of people, and even the idle boys, who had often, no doubt, made a mock of her when she was alive, and called her mad Miriam as she hurried along, seemed to be awed into silence by the solemn seriousness of the other spectators. The clergyman read the beautiful service of the Church of England with deep feeling; and when all was over, and we had heard that indescribably affecting sound of the first dust thrown upon the coffin, I turned away, but I fancied that all present withdrew, like myself, with relieved and rejoicing hearts, because a sufferer was at rest.

The next day I left C—, and the coach in which I was, passed the churchyard in which poor Miriam lies, and I eagerly looked out for her grave. I had marked the spot exactly, and, as I expected, the hand of faithful affection had already covered with the fresh and blooming flowers of spring the grave of the *Blighted One*.

There, I have done; now, tell me how you like my story!"

A. O.

POLYTECHNIC INSTITUTION.

A YEAR or two ago, a description was given in this Journal, of the Adelaide Gallery, an establishment recently set on foot in London for the advancement of scientific knowledge, and for its dissemination, in a pleasing way, among the great body of the people. The Polytechnic Institution is another metropolitan establishment of the same order, which has lately been incorporated by royal charter, and of which we purpose to give some account in the present article.

The title of "Polytechnic," conferred on this institution, implies its having in view the advancement of the "various arts and sciences." To the furthering of practical science, more particularly in connection with agriculture, manufactures, and other branches of industry, are the views of the institution directed. For these purposes, a large and convenient edifice has been built, having its public entrances at No. 309, Regent Street, in the west end of the city. The front of this structure is extremely elegant, and the whole building extends backward for a length of three hundred and twenty feet, affording abundant space for the numerous divisions required in the interior. The principal of these divisions may be thus enumerated. 1st, The hall of manufactures; 2d, The great hall; 3d, The gallery of the great hall; 4th, The theatre, or lecture room; 5th, The chemical laboratory; 6th, The boiler room; 7th, The engineer's workshop; 8th, The geological room; 9th, The room containing the block-cutting machinery and naval models; 10th, The bazaar of the benevolent repository (a particular association of ladies, in connection with the institution, for disposing of works of art and ingenuity for charitable purposes). To these divisions of the establishment may be added a reading-room, where periodicals and newspapers are furnished for the use of an especial class of subscribers, who pay annually a sum of three guineas for the conjoint privileges of the reading-room and institution. The annual subscriber's ticket, for the institution itself, is one guinea, and the cost of admission to non-subscribers one shilling. For this latter sum the visitor may view

* When I was first intending to write down this story, told me by my friend in my youth, I was much mortified to find myself forestalled by a similar anecdote, related in that unique and most amusing book, "The Doctor," vol. iii. pp. 66 and 67. That "great known unknown" says the fact is related by Dr Uwin in his Treatise on Disorders of the Brain. But he tells it of a lady, and says the lost object was her husband, and that this lady, for fifty years, went to the spot where she expected to meet her husband, saying, like poor Miriam, "He is not come yet, I will return to-morrow!" Though alike, it does not follow that the stories are the same; but I am very sure, that, so my friend was not given to deceive, my story is a true one, and very likely so is Dr Uwin's, as the same cause might have the same effect.

the whole contents of the establishment, hear the daily lecture upon some branch of natural philosophy, and witness, at fixed hours mentioned in the bills, the operations of the microscope and diving-bell, as well as various magnetic and electro-magnetic experiments.

Though opened to the public only in August 1838, the Polytechnic Institution is already rich in contents. The hall of manufactures, which is forty-five feet long by forty wide, has six divisions, the first of which exhibits a small printing establishment. The printing-press is Wayte's self-inking one, which is represented as saving the labour of one man entirely, and the frames and case-racks are upon an improved plan. This division contains also models of larger printing-machinery. A second division of this hall exhibits the workshop of an optician; a third, a glass manufactory; a fourth, weaving by power-looms; a fifth, the workshop of a turner; and a sixth contains a rotary or revolving steam-engine of six-horse power, upon a plan invented by the Earl of Dundonald (late Lord Cochrane), who states the advantages of his engine to be "a circular motion originated from one solid part, incapable of derangement." It is scarcely necessary to say, after this enumeration, that the hall of manufactures presents to the visitor many objects of interest. He may purchase specimens of all the various kinds of manufactures, and, if possessed of a taste for making optical instruments, for glass-blowing, for turning, or for printing, will have full opportunities here of learning the best mode of fitting up small private establishments in any of these branches.

The principal staircase of communication leads from the hall to a spacious apartment, devoted to the purposes of a charity bazaar, and supplied with the numberless articles of taste and ornament usually found at fancy fairs, by the association of ladies alluded to. Directly over the hall of manufactures is the lecture room, capable of containing five hundred persons, and where a lecture is delivered every day, at two o'clock, on some branch of science. In this theatre the largest hydro-oxygen microscope ever constructed is exhibited. The screen for the display of the magnified objects contains four hundred and twenty-five square feet, and the power of the instrument is proportionally immense. Behind the apartments now mentioned, is the great hall, which is entered from the main staircase, and which measures one hundred and twenty feet in length, forty feet in width, and the same in height. This noble apartment has a gallery passing around its whole extent above. The most prominent objects in the great hall are the two canals in the centre of the floor, which are united at one end in a deep cistern, and present altogether something of the form of a horse-shoe. The superficial extent of this sheet of water is seven hundred feet, and the gross amount of the fluid ten thousand gallons. The principal use of these canals and their uniting reservoir, which last portion of the water is much deeper than the rest, is to exhibit all the operations connected with naval architecture, and to show the practical operation of the diving-bell and other diving apparatus. In connection with the former of these objects, the canals and the space between them present the models of a building dock, launching slip, dry dock, graving slip, and pier, as well as of canal locks and other structures of much importance. There are also many beautiful and complete models of vessels, foreign and British, and of portions of vessels, or improved instruments belonging to them. Altogether the canals afford in this respect an admirable field for the study of naval architecture.

The diving-bell requires a more detailed notice. This machine is capable of holding four or five persons, and at certain times visitors have the choice of descending in it into the reservoir. The diving-bell is composed of cast-iron, open at the bottom, with seats around, and is of the weight of three tons. The interior is lighted by windows or openings, in the rounded crown or top, of thick plate glass, which is firmly secured by brass frames screwed to the bell. The machine is suspended by a massive chain to a large swing crane, with a powerful crab, the windlass of which is grooved spirally, and the chain passes over into a well beneath, where the compensation weights hang, arranged so accurately that the weight of the bell in the reservoir is counterpoised by them at all depths. Two powerful air-pumps of eight inch cylinder supply the bell with air, which is readily conveyed by leather pipes to any depth. Such is the diving-bell of the Polytechnic Institution. It is put into action several times daily, in presence of many spectators. No inconvenience is ever occasioned to those who descend, and real danger is almost impossible, as the whole ten thousand gallons of water can be let off in the space of one minute at any time! It is scarcely necessary to say that the principle of the diving-bell is the same as that which preserves the inside of a glass tumbler dry, when plunged into water with the mouth downwards. Another exhibition accompanies that of the diving-bell in the great hall of the institution. A diver, from the "Submarine and Wreck-Weighing Association," descends to the bottom of the reservoir, clothed in a water-and-air-tight diving-dress. A large helmet, furnished with eyes or windows of glass, encloses the diver's head, and he is furnished with air by means of flexible tubes. By taking a model of a ship with him to the bottom of the reservoir, and there affixing to it close bladders or cones filled with air, the diver makes the little vessel rise spontaneously to the surface, and thus shows in miniature the objects of the Submarine Association to which he belongs. That society proposes to raise sunken ships, and also to

keep up sinking ones, by affixing to them, in this manner, large air-and-water-tight bags or vessels, which may elevate them to, or maintain them at, the surface, on being inflated with air by the air-pump. We do not know whether this plan has succeeded on a great scale, but, certainly, the diver effects his object perfectly in the reservoir.

The great hall is surrounded by glass presses or cases, in which a vast number of useful, rare, and curious models of all kinds, are enclosed, with here and there some fine painting, bust, or other ornamental object, to add variety to the scene. Perhaps one of the very greatest curiosities in the whole building is the Mosaic portrait of the king, George IV., which stands in a small room at the west end of the hall. Our readers may be at some loss at first to understand what is meant by a Mosaic picture. The one now alluded to is composed of about two millions of separate stones—pebbles, jaspers, and many others—all polished and laid together so as to form one smooth continuous surface, while arranged so, at the same time, as to colours, as to give an excellent likeness of George IV. Not one speck of paint was used in the composition, which occupied the artist, Moglia, a period of five years. The natural hues of the stones were the only dyes employed by the artist. This extraordinary portrait is for sale, and the price asked for it is one thousand guineas.

Handsome side stairs lead the visitor to the gallery of the great hall. This place also is sided all along with glass cases, containing various models and other objects of interest, interspersed here and there with paintings and busts. At each end of the gallery there stands a large metallic reflector, the one placed precisely opposite to the other. The reflection of sound, as well as of heat, is strikingly exhibited to the visitor by these reflectors. Though distant from each other one hundred feet, the slightest whisper, emitted in front of the one, may be heard in the focus of the other; and a piece of meat may in like manner be cooked in the focus of the one when a fire is placed in the focus of the other. It is impossible here to do justice to the general contents of this gallery. Hydrostatic beds, clocks, orreries, anatomical and agricultural models, with numerous articles of virtu, have been collected for the gratification of the spectator. Even the paintings are of a very superior order, there being originals by Rubens and Salvator Rosa in the gallery. We can only particularise a few, however, of the remaining objects to be seen about the great hall and its gallery.

In one of the glass cases there is to be seen what is called "an hydrostatic paradox." The machine to which this name is given is a long vertical tube, rising out of a flat bellows. A person standing on the bellows can raise himself by blowing down the tube. The principle is the same here as that which enables a small column of water to burst a strong barrel when thoroughly filled. The column of air or of water bears on all parts with equal weight, and thus effects what was at first thought so wonderful as to be termed the hydrostatic paradox. A still more remarkable instrument is the powerful electro-magnet, which is to be seen daily in operation. This instrument is simply a bar of soft iron, bent into the form of a horse-shoe magnet, around which is wound a series of convolutions of insulated copper wire. When a voltaic current (or current from a voltaic or galvanic battery) is made to circulate through these coils, and, consequently, at right angles to the axis of the iron bar, powerful magnetic effects are instantly developed, and the bar of soft iron becomes for the time a magnet of immense power, being capable of supporting the enormous weight of one ton, or 2240 lbs. This power exists only during the maintenance of the voltaic current; when this ceases, the bar of soft iron returns instantly to its original state, and is magnetic no more. Among the electro-magnetic instruments there are some others not less remarkable than the preceding. There are also models of land carriages, where the intended moving power is electro-magnetic.

The geological room, attached to the great hall, is not yet completely furnished; but, in the mean time, there is a loom in it, called a Jacquard loom, where the delicate and difficult operation of weaving figured silk is to be daily beheld. The room containing the block-cutting machinery, must be to many one of the most interesting portions of the establishment. All the blocks for the service of the British navy are made from machines of this description, which drive saws of various kinds, and chisels, and go through all the successive operations of boring, morticing, shaping, scoring, drilling, &c., till they bring the rough timber to the condition of the finished block.

The chemical laboratory, the boiler room, and the engineer's workshop, adverted to at the commencement of this paper, are on the basement story of the building, beneath the hall of manufactures. The laboratory is calculated to be of great service to private experimentalists and patentees, who may wish to prosecute inquiries, with competent assistance, into any particular and intricate point connected with some branch of manufacturing industry. Such purposes were in the view of the founders of the laboratory. Two steam-engine boilers, and other machinery, are to be seen in the boiler room; and a forge, and other apparatus, in the engineer's workshop. On this basement story, also, visitors have an opportunity of daily witnessing various plans of economical cookery in practical operation. Not unimportant lessons may here be learned respecting the saving of fuel, and other matters of consequence in every-day life.

It is scarcely necessary for us to observe, in conclusion, that of the plan and objects of such institutions as this we highly approve. Indeed, the feeling of approval seems very general, if we may judge from the number of visitors who are constantly to be seen in the various apartments of the Polytechnic Institution; and as the establishment is yet in its infancy, it is but reasonable to anticipate that, as its contents grow more varied and interesting, the support given to it will continue to increase. We hope and trust this will be the case.

A FEW WEEKS ON THE CONTINENT.

THE BRUNNENS OF NASSAU.

We have arrived in Nassau, a German duchy, to which allusion has occasionally been made in the previous articles. Nassau is a hilly district, bearing a considerable resemblance in its moderately high mountains and narrow fertile valleys to the southern part of Scotland, and contains altogether about 350,000 inhabitants. On the west, from the vicinity of Frankfurt to near Ehrenbreitstein, it is bordered by the Rhine in the most romantic part of its course. The title of the duchy is derived from the exceedingly ancient castle of Nassau, standing on the river Lahn in the heart of the district; and from two sons of Otho, the feudal proprietor of that stronghold in the tenth century, sprang the present Duke of Nassau and the King of Holland—the latter being from the younger of the sons. The house of Nassau, therefore, in its two branches, is entitled to be ranked as one of the oldest of the reigning families of Europe.

The duchy of Nassau is the beau-ideal of a nice little sovereignty. With great external beauty, the country is sufficiently fertile in its low winding valleys for any reasonable wish; on its sloping hill-sides are vineyards producing the finest of the Rhenish wines; its climate is in a high degree salubrious; and it possesses a large share of mineral wealth, particularly coal and iron, while its slate forms a large article of export. The most remarkable thing about Nassau, however, is its mineral springs, which have been resorted to by real or imaginary valetudinarians since the days of the Romans, and are now visited annually by thousands of persons from all parts of northern Europe. These mineral springs, or brunnens, as they are called, have within the last few years been made favourably known in England by means of various highly interesting works, among which I need only allude to "Bubbles from the Brunnens of Nassau," by Sir Francis Head, and the "Spas of Germany," by Dr Granville; so much, indeed, has been lately written respecting the Nassau waters, that I should consider it useless to say any thing about them, if I did not know that these unpretending papers pass into the hands of many readers, who cannot have had an opportunity of seeing any of the published works on the subject.

The springs of Nassau are of widely different temperatures and qualities, some being as hot as 150 degrees of our common thermometer—that is, nearly as hot as the hand can endure on being plunged into them, and others being quite cold. They rise in various parts of the country, from the bottoms of hills; and wherever they have made their appearance, there has a town, or at least some dwellings for visitors, been planted. The places of greatest resort are four in number, Wiesbaden, Schlangenbad, Langen-Schwalbach, and Ems. Speaking in a general manner of the waters at these places, the author of "Bubbles from the Brunnens" observes—"From the hills burst mineral streams of various descriptions, and besides the Selters or Seltzer water, which is drunk as a luxury in every quarter of the globe, there are bright sparkling remedies presented for almost every disorder under the sun:—for instance, should our reader be consumptive, or, what is much more probable, be dyspeptic, let him hurry to Ems; if he wishes to instil iron into his system, and to brace up his muscles, let him go to Langen-Schwalbach; if his brain should require calming, his nerves soothing, and his skin softening, let him glide onwards to Schlangenbad; but if he be rheumatic in his limbs, or if mercury should be running riot in his system, let him hasten, 'body and bones,' to Wiesbaden, where, they say, by being parboiled in the Kochbrunnen, all his troubles will evaporate."

Entering the country from the farther extremity, we, in the course of our journey, first reached Wiesbaden, the capital of the duchy, and principal place of resort by visitors. Wiesbaden is a handsomely-built town of modern appearance, situated in a valley surrounded with hills, but having a pleasant exposure and inclination to the south, or in the direction of Bibrech on the Rhine, from which it is only a few

miles distant. It is in a particular manner protected from the north and north-east winds by high swelling hills, and is therefore allowed to be as suitable for a place of abode during winter as summer. The various rows of neat stone houses, which compose the principal streets, contain all classes of private lodgings for strangers; and besides these, there are several large hotels, which, during our stay, were crammed with temporary residents. The greater number of the latter public establishments are in the neighbourhood of each other in the more confined part of the town, and are so placed to be near the source of the chief hot spring, which is conveyed by pipes to their baths. There are altogether fourteen springs, though it is believed they are from one main source in the north-west part of the mountain overhanging the town, as they resemble each other in quality and temperature. The chief is the Kochbrunnen (boiling spring), which rises in a small open court or place, and is environed with a wall, except at a spot where steps descend to the brink of the water. Approaching this enclosure, we perceive a cloud of vapour rising from the surface of the spring, as from a hot caldron. The water is of a dull yellow appearance, by no means inviting, and is at the temperature of 150 degrees Fahrenheit, which it maintains during every season of the year. In the morning it is drunk in large quantities by the visitors, a person dipping and filling their glasses at a small charge. The taste of the water is very peculiar, and has been compared by some writers to weak chicken broth. "When I (says the author of the 'Bubbles') declare that it exactly resembles very hot chicken broth, I only say what Dr Granville said, and what in fact every body says, and must say, respecting it; and certainly I do wonder why the common people should be at the inconvenience of making bad soup, when they can get much better from Nature's great stock-pot—the Kochbrunnen of Wiesbaden. At all periods of the year, summer or winter, the temperature of the broth remains the same; and when one reflects that it has been bubbling out of the ground, and boiling over, in the very same state, certainly from the time of the Romans, and probably from the time of the flood, it is really astonishing to think what a most wonderful apparatus there must exist below, what an inexhaustible stock of provisions to ensure such an everlasting supply of broth, always formed of exactly the same eight or ten ingredients, always salted to exactly the same degree, and always served up at exactly the same heat. One would think that some of the particles in the recipe would be exhausted; in short, to speak metaphorically, that the chickens would at last be boiled to rags, or that the fire would go out for want of coals; but the oftener one reflects on these sort of subjects, the oftener is the old-fashioned observation repeated, that, let a man go where he will, Omnipotence is never from his view!"

Very wonderful things are told of the curative powers of the waters. According to Dr Granville, gout, rheumatism, paralysis, and other serious complaints, yield to a full course of bathing and drinking. My own idea is, that the chief and direct benefit consists in the promotion of intestinal action with relief to the skin, and that these, united with fresh air, exercise, and change of diet and scene, lead to all the cures which we hear of being performed both at this and the other watering-places.

Our residence during our short stay was at the Eagle Hotel, an establishment surpassing in size all the inns which had hitherto come under our notice. It possesses a spring of mineral water, second only in strength and heat to the Kochbrunnen; and this, by giving it a degree of superiority over other establishments of the kind, crowds it with customers. The lower floor of a large wing of the building is occupied entirely with bathing closets, into which the water is conducted in a prime state of warmth, as may be required by the various bathers.

It being a Sunday which we chanced to spend in Wiesbaden, an opportunity was afforded us of seeing the town in its holiday dress, and also in what manner the day was spent in the capital of the Protestant state of Nassau. Judging from external appearances, there was no difference between the mode of spending the Sunday here and at Cologne, or, I may add, at Brussels. All the shops, with the exception of a few of what may be called the more respectable, were open from morning till night, and unless that there was attendance at church to a comparatively small extent, there was really nothing to indicate that it was the day of rest. The scene in the dining-hall of our hotel went beyond anything I ever witnessed in the form of hubbub. Let the reader only conceive the idea of an immensely large apartment, resembling a ball-room, filled with tables at which there sat down two hundred and forty persons to dinner; then imagine the hurrying of waiters, the loud talking of the people—the Germans are horrid talkers—and the deafening play of drums, trumpets, and hautboys, in the gallery; the whole forming a scene of the most distracting nature, which it was out of our power to endure. Hastening away as soon as possible from this "quiet Sunday dinner," we proceeded to the eastern environs, where, close by a pretty piece of park scenery, and near the public thoroughfare from Frankfurt, stands the grand object of attraction in Wiesbaden. This is the Kursaal, a handsomely built edifice, of a single story in height, but covering a considerable space of ground, and containing a number of magnificent apartments devoted to public entertainments and gambling.

Reaching towards it on one side, like an extensive wing, is a long open colonnade, the inner side of which is laid out as shops for the sale of jewellery, drapers' goods, shoes, books, toys, pictures, and other objects, all which wares were exposed in gay profusion on stalls, as in a bazaar. On proceeding to the grounds behind, we found them already fast filling with company, while hundreds of persons, scattered about on chairs and forms, were busy sipping coffee supplied by the active attendants of the Kursaal.

Curious to observe what was going on within doors, we sauntered through the laughing and chatting groups of smokers and coffee-drinkers into the great central hall or saloon of the edifice. This saloon, which may be one hundred and thirty or one hundred and forty feet in length, and fifty feet in height, is elegantly embellished with painting and gilding, and is striking in effect, from possessing a gallery all round, supported by thirty massive Corinthian pillars of red marble. In this splendid apartment, balls and concerts take place during certain evenings of the week, and a table-d'hôte is prepared daily at the usual small dinner charge for all who are pleased to attend. At the table-d'hôte on Sunday, the Duke of Nassau, who resides at a hunting-seat in the neighbourhood, ordinarily gives his presence, which has the effect of causing the establishment to be visited by the elite of Wiesbaden society. To an Englishman, nothing seems more strange than this species of intercourse between the sovereign of a state and the throng of visitors at a watering-place in his dominions. Such things, however, excite no surprise in continental society, in which there is a familiarity between high and low—at least between all whose conduct bears the stamp of politeness—that could not for a moment be sanctioned in Britain, notwithstanding all its freedom, and the democratic nature of some of its institutions.

Previous to our entrance into the great saloon, the long dinner tables had been cleared away, and two men were just in the act of bringing in a rather heavy-looking iron-bound box, which they placed in the middle of the floor. Next, they set down a table of a particular construction, and opening the box, drew out several bags of coins, consisting of gold and silver pieces, which they arranged in heaps upon the table. Lastly, they planted in the centre of the table the usual instrument of gaming—a revolving horizontal dish and ball. The perfect business-like coolness with which these preparations were made, was deeply interesting. We had heard of gaming-tables, but never before had seen one. Not that England cannot show such things, but happily they have the discredit of being illegal, and do not fall within the every-day experience of the middle classes. Here, however, there was no disguise, no illegality—the whole affair was quite open, and all ranks had an opportunity of venturing their money. Shortly, the directors took their seats, a crowd of men and women gathered round, and the play commenced. I anxiously watched the very curious scene. There was no lack of players, but I kept my eye on three in particular. One was a gentleman, who, with a firm calculating countenance and undisturbed air, risked a gold piece at each roll of the ball, and seemed tolerably successful; after a certain length of time, when he had pocketed at least half-a-dozen Frederick d'ors, he walked away, as if satisfied with his day's work. The other two persons were females; one was an elderly lady, apparently about sixty years of age, perhaps seventy, and the other a peasant, seemingly the wife of a neighbouring rustic—a woman, for instance, who had come to town to sell the butter and cheese which she had made during the week, and now, mingling with nobles and gentry, was perilling her sorry earnings upon the gaming-table. The old lady was entranced in the game; she was losing; her throat wrought in agony, like an exhausted pump; now, she gained a thaler, and her spirits rose; she had, as she imagined, got the turn; but no: again luck was running against her; she could endure it no longer, and retired out of sight to give room to a new comer. The peasant woman was moderately successful. She never risked more than a silver coin about the value of half-a-crown, and her tactics consisted in always laying the money on the same colour. Red was her favourite. She staked a piece on a corner patch of red every roll of the ball. I think she must have gained a dozen pieces before she retired, yet she did not appear any way elated; she might have lost previously at some other table, or on the previous Sunday, and had now only won back the amount of her losses. At all events, I set her down as a being who was on the high road to ultimate ruin, and I hoped that she was not a proper sample of the peasantry of Nassau.

The establishment of the rouge-et-noir table in the grand saloon, did not excite particular attention. There was, as we observed, another table of the same kind in a side apartment fully as well attended, and from a room adjacent were heard the laughter and shouts of billiard players equally busy at their game. It rather excited our surprise to see no English at any of these gaming tables, the players being either Germans or French; perhaps they preferred attending the opera, which was proceeding in another quarter of the town, but of this we had no opportunity of judging. Disgusted with the racket and irrationality which every where met the eye, and finding not a single spot at our hotel where quietness could be obtained, we early in the evening ordered the calash to be yoked, and, stowing ourselves in it, fled from Wiesbaden to a scene

which we hoped would be more congenial both to our feelings and to the peaceful character of the day.

It was a lovely autumnal evening as our carriage wound its way over the rounded heights of the Taunus mountains in the direction of Langen-Schwalbach. At every step we were reminded of the resemblance to our own Scottish mountain scenery. Leaving the lower vales, thickly clad with apple-trees and vines, we found, as we ascended, that the hill-sides became brown and heathy, and were here and there enriched with plantations of hardy timber, which gave shelter to the arable fields of the upland farmers. All was placidly calm as a Sunday evening ought to be. The small forests of larch and oak which lay open to our path, and into which we now and then penetrated a short way, were silent as a desert far from the haunts of man. The inhabitants of a small hamlet sat at their doors, in their holiday dresses, enjoying the tranquil scene, and showed, by their appearance, that they at least rested from their labours one day in seven. Having gained a considerable altitude on the ascending braes, a splendid view of the Rheingau presented itself on our left, through an opening in the woods. The whole expanse of the river, with its rich banks from Bingen to Mayence, lay spread out like a picture, and we for a moment felt how far these glorious works of Nature transcended those which mankind usually create for their contemplation and amusement. From this point the road to Langen-Schwalbach proceeds in a northerly direction at a greater distance from the Rhine, which is hence shut out from the view of the traveller. Those, however, who wish to visit Schlangenbad, turn to the left, and are conducted by a steep descending path to that place of resort.

Schlangenbad, which unfortunately we could not afford time to visit, consists of little else than two large boarding-houses, with baths and springs for the accommodation of visitors. It is the most retired of all the brunns of Nassau, and is chiefly resorted to by persons who are desirous of enjoying country air with the softening and cheering influences of its cosmetic waters. On this latter account, it is, I believe, most in favour with ladies, particularly those who find the necessity for remedying the injuries of time. The mineral spring of Schlangenbad owes its purifying and softening properties to muriates and carbonates of lime, soda, and magnesia, held with a certain quantity of carbonic acid in solution. Its name signifies the Serpent's Bath, there being a plentiful variety of snakes, though of a harmless kind, in the vicinity. The author of the "Bubbles" is ecstatic in his description of the delicious influence of the water on the skin, though not more so than other writers. "The baths at Schlangenbad (says he) are the most harmless and delicious luxuries of the sort I have ever enjoyed; and I really quite looked forward to the morning for the pleasure with which I paid my addresses to this delightful element. The effect it produces on the skin is very singular; it is about as warm as milk, but infinitely softer; and after dipping the hand into it, if the thumb be rubbed against the fingers, it is said by many to resemble satin. Nevertheless, whatever may be its sensation, when the reader reflects that people not only come to these baths from Russia, but that the water, in stone bottles, merely as a cosmetic, is sent to St Petersburg and other distant parts of Europe, he will admit that it must be soft indeed to have gained for itself such an extraordinary degree of celebrity—for there is no town at Schlangenbad, not even a village; nothing, therefore, but the real or fancied charm of the water could attract people into a little sequestered valley, which, in every sense of the word, is out of sight of the civilised world; and yet, I must say that I never remember to have existed in a place which possessed such fascinating beauties; besides which (to say nothing of breathing pure dry air), it is no small pleasure to live in a skin which puts all people in good humour—at least with themselves. But besides the cosmetic charms of this water, it is declared to possess virtues of more substantial value: it is said to tranquillise the nerves, to soothe all inflammation; and from this latter property, the cures of consumption which are reported to have been effected, among human beings and cattle, may have proceeded. Yet whatever good effect the water may have on this insidious disorder, its first operation most certainly must be to neutralise the bad effects of the climate, which to consumptive patients must decidedly be a very severe trial; for, delightful as it is to people in robust health, yet the keenness of the mountain air, together with the sudden alternations of temperature to which the valley of Schlangenbad is exposed, must, I think, be anything but a remedy for weak lungs." With respect to the precise influence of the water on the body—"it is, in my opinion (continues the same writer), a sort of corrosion which removes tan, or any other artificial covering that the surface may have attained from exposure and ill treatment by the sun and wind. In short, the body is cleaned by it just as a kitchen-maid scours her copper saucepan; and the effect being evident, ladies modestly approach it from the most remote parts of Europe."

Wishing every success to those among our fair readers who may make the attempt to preserve the beauty of their complexions by a dip in the wonder-working waters of Schlangenbad, we proceed on our way to Langen-Schwalbach, where we propose to set up our staff of rest for the night. The sun had just sunk behind the western hills as our calash drove

down the steep winding road that conducts us into the valley in which this secluded village with its famed brunns is situated. Agreeably to a previous recommendation, we took up our quarters at the Allée-Saal, or Hotel du Promenade, a house of enormous size, situated on a woody bank at the head of the village. Here, though crowded with inmates, there was a degree of repose which one might search for in vain in Wiesbaden. Yet here, also, in the principal saloon, was there placed a rouge-et-noir table, glittering with its heaps of gold and silver, and surrounded by a few players—a circumstance which showed us pretty plainly that gambling forms one of the peculiar attractions of the brunns of Nassau.

On the morning after our arrival, we rose with the early dawn, in order to explore betimes, ere the visitors awakened from their slumbers, the whole mechanism of Langen-Schwalbach. But here I must stop for the meanwhile; my space is exhausted; and it will not be for a week to come that I can introduce the reader to what met my eyes in the course of our ramble.

SNAKES AND SNAKE-CHARMERS.

It is only on visiting, and residing for a time in India, that one can become thoroughly sensible of the immense benefit conferred by St Patrick upon Ireland, when he preached his famous

"sarrfin,
That gave the frogs and toads a twist,
And banished all the varmin."

among which we may reasonably include snakes of all kinds and degrees. To new-comers in Hindostan, and particularly to those of nervous temperament, these creatures constitute a source of perpetual alarm. Their numbers are immense, and no place is sacred from their visitations. Just fancy the agreeable surprise resulting from such little occurrences as the following, which are far from being rare. You get up in a morning, after a feverish night perhaps; languidly you reach for your boots, and upon pulling on one, feel something soft before your toes, and on turning it upside down, and giving it a shake, out pops a small snake of the carpet tribe (as they are called, probably from their domestic propensities), wondering what can be the cause of his being thus rudely ejected from his night's quarters. Or suppose, at any time during the day, you should be musically inclined; you take your flute from its resting-place, and proceed to screw it together, but find, on making an attempt to play, that something is the matter, and on peeping into it, discover that a little serpentine gentleman has there sought and found a snug lodgement. Perhaps your endeavour to give it breath with your mouth makes Mr Snake feel his habitation in the instrument uncomfortably cold, and, ere you are aware of his presence, he is out, and wriggling among your fingers.

Such incidents as these cause rather unpleasant starts to those who are new to Hindostanic matters, though the natives of the land, or persons who had been long resident in it, might only smile at the new-comer's uneasiness, and tell him that these little intruders were perfectly harmless. But even with the assurance of this fact, it is long ere most Europeans can tolerate the sight and presence of these snakes, much less feel comfortable under their cold touch. Besides, it is but too well known that all these creatures are not innoxious. Well do I remember the fright that one poor fellow got in the barracks at Madras. He had possibly been indulging too freely over night; at least, when he rose in the morning in question, he felt thirsty in the extreme. Yawning most volitionally, he made up to one of the room windows, where stood a large water bottle or jar, one of those long-necked clay things in which they usually keep fluids in the east. Upon taking this inviting vessel into his hands, he observed that there seemed to be but little water in it, yet enough, as he thought, to cool his parched throat; and he had just applied it to his lips, when something touched them—certainly not water, whatever else it might be. He hastily withdrew the vessel from his mouth, though still retaining it in his hands, when, to his amazement and horror, a regular cobra, the most deadly and dangerous of all the common serpents of India, reared its hideously distended and spectacled head from the jar, not a foot from its disturber's nose. "Oh, murder!" cried the poor fellow, who was a son of Erin; and as he uttered the exclamation, he dashed bottle, snake, and all to the ground, and took to his heels, nor stopped until he was a full hundred yards from the spot. Here he told his story in safety, and the intruder was in good time got rid of by the cautious use of fire-arms.

Very different from the conduct of this fellow was that of one of his comrades in the same barracks, who was exposed to an almost unprecedented trial from a similar cause. In the vicinity of the barracks assigned to the European soldiers in India, there is usually a number of little solitary buildings or cells, where the more disorderly members of the corps are confined for longer or shorter terms, by order of the commanding officer. In one of these, on a certain occasion, was locked up poor Jock Hall, a Scotsman belonging to Edinburgh or Leith. Jock had got intoxicated, and being found in that condition at the hour of drill, was sentenced to eight days' solitary imprisonment. Soldiers in India have their bedding partly furnished by the Honourable Company, and find the remainder for themselves. About this part of house furnishing, however, Jock Hall troubled himself very little, being

one of those hardy reckless beings on whom privation and suffering seem to make no impression. A hard floor was as good as a down-bed to Jock, and therefore, as he never scrupled to sell what he got, it may be supposed that his sleeping furniture was none of the most abundant or select. Such as it was, he was stretched upon and under it one night in his cell, during his term of penance, and possibly was reflecting on the impropriety of in future putting "an enemy into his mouth to steal away his brains," when, lo! he thought he heard a rustling in the cell, close by him. At this moment he recollected that he had not, as he ought to have done, stopped up an air hole, which entered the cell on a level with its floor, and also with the rock, externally, on which the building was planted. A strong suspicion of what had happened, or was about to happen, came over Hall's mind, but he knew it was probably too late to do any good, could he even find the hole in the darkness, and get it closed. He therefore lay still, and in a minute or two heard another rustle close to him, which was followed by the cold slimy touch of a snake upon his bare foot! Who in such a situation would not have started and bawled for help? Jock did neither; he lay stone still, and held his peace, knowing that his cries would most probably have been unheard by the distant guard. Had his bed-clothes been more plentiful, he might have endeavoured to protect himself by wrapping them closely around him, but this their scantiness forbade. Accordingly, being aware that, although a motion or touch will provoke snakes to bite, they will not generally do it without such incitement, Jock held himself as still as if he had been a log. Meanwhile, his horrible bed-fellow, which he at once felt to be of great size, crept over his feet, legs, and body, and, lastly, over his very face. Nothing but the most astonishing firmness of nerve, and the consciousness that the moving of a muscle would have signed his death-warrant, could have enabled the poor fellow to undergo this dreadful trial. For a whole hour did the reptile crawl backwards and forwards over Jock's body and face, as if satisfying itself, seemingly, that it had nothing to fear from the recumbent object on its own part. At length it took up a position somewhere about his head, and went to rest in apparent security. The poor soldier's trial, however, was not over. Till daylight, he remained in the same posture, flat on his back, without daring to stir a limb, from the fear of disturbing his dangerous companion. Never, perhaps, was dawn so anxiously longed for by mortal man. When it did come, Jock cautiously looked about him, arose noiselessly, and moved over to the corner of his cell, where there lay a pretty large stone. This he seized, and looked about for the intruder. Not seeing the snake, he became assured that it was under his pillow. He raised the end of this just sufficiently to get a peep of the creature's crest. Jock then pressed his knee firmly on the pillow, but allowed the snake to wriggle out its head, which he battered to pieces with the stone. This done, the courageous fellow for the first time breathed freely.

When the hour for breakfast came, Jock, who thought little about the matter after it was fairly over, took the opportunity of the opening of the door to throw the snake out. When the officer whose duty it was to visit the cells for the day, was going his rounds, he perceived a crowd around the cell-door examining the reptile, which was described by the natives as of the most venomous character, its bite being invariably and rapidly mortal. The officer, on being told that it had been killed by a man in the adjoining cell, went in and inquired into the matter. "When did you first know that there was a snake in the cell with you?" said he. "About nine o'clock last night," was Jock's reply. "Why didn't you call to the guard?" asked the officer. "I thought the guard wadna hear me, and I was feared I might tramp on't, so I just lay still." "But you might have been bit; did you know that you would have died instantly?" "I kent that very weel," said Jock, "but they say that snakes winna meddle with you, if you dinna meddle with them; sae I just let it crawl as it liket." "Well, my lad, I believe you did what was best after all, but it was what not one man in a thousand could have done." When the story was told, and the snake shown to the commanding officer, he thought the same, and Jock, for his extraordinary nerve and courage, got a remission of his punishment. For some time, at least, he took care how he again got into such a situation as to expose him to the chance of passing another night with such a bed-fellow.

It has frequently been asserted that the most tremendous of the snake tribe, the boa-constrictor, does not now exist in Hindostan, and has not done so for a considerable time. This statement is to be taken with some reservation. When our Anglo-Indian army were called to the field a few years ago, to teach a lesson to an obstinate native potentate, two of our soldiers left a temporary encampment of the troops, in order to indulge in a bath. They had a portion of jungle to cross, and, in doing so, the foot of one of them slipped into a sort of hole. This proved to be an old elephant-trap; that is to say, a pit of considerable size dug in the earth, and covered over with branches, sticks, and such like matters, so as to deceive the wild elephant into placing his mighty weight upon it, when he sinks, and is unable to get out again. The soldier got his foot withdrawn from the trap, though at the cost of his shoe, which the closeness of the branches caused to come off. Little did the poor fellow know at the moment what a fate he had narrowly escaped! But he

soon became sensible of it. On looking down to see whither his shoe was gone, and if it was recoverable, he beheld a sight, which, but for the hold he had of his companion's arm, would have made him yet totter into the pit from sheer horror. Through the opening made by his foot, he saw an enormous boa-constrictor, with its body coiled up, and its head curved, watching the opening above, and evidently prepared to dart on the falling prey. Hurrying from the spot, the two soldiers informed some of their officers, who immediately came to the trap with fire-arms. The creature was still there, and, indeed, had most probably remained in the place for a length of time, preying on the unfortunate animals, great and small, which tumbled into its den. Ball and swan-shot, both used at once, brought the reptile's life to a close, and it was got out of the hole. It proved to be fifteen feet long, and about the general thickness of a man's thigh. The skin and scales were most beautiful. It was intended to make two cases of the skin, for holding the regimental colours, and would have been large enough for the purpose. But it was entrusted to unskilful hands, and got withered and wasted in the preparation.

The Hindoos, or at least the serpent-charmers among them, pretend, as is well known, to handle all sorts of snakes with impunity, to make them come and go at a call, and, in short, to have a cabalistic authority over the whole race. These pretensions are necessary to the exercise of their profession, which consists, in part, in ridding private houses of troublesome visitants of this description. One of these serpent-charmers will assert to a householder that there are snakes about his premises, and, partly from motives of fear and partly from curiosity, the householder promises the man a reward, if he succeeds in showing and removing them. The juggler goes to work, and soon snakes are seen to issue from some corner or another, obedient to his call. The performer takes them up fearlessly, and they meet like old friends. In fact, the opinion of the more enlightened residents in India is, that the snakes and their charmer are old friends; that he hid them there, and, of course, knew where to find them; and, moreover, that having long ago extracted the poisonous fangs, he may well handle them without alarm. Still, a large portion of the community, Europeans as well as natives, believe that these charmers have strange powers over the snake tribe. In Madras, however, while I was there, this belief received a sad shake by a circumstance which occurred. One of the most noted serpent-charmers about the district chanced one morning to get hold of a cobra, of considerable size, which he got conveyed to his home. He was occupied abroad all day, and had not time to get the dangerous fang extracted from the serpent's mouth. This, at least, is the probable solution of the matter. In the evening he returned to his dwelling, considerably excited with liquor, and began to exhibit tricks with his snakes to various persons who were around him at the time. The newly caught cobra was brought out with the others, and the man, spirit valiant, commenced to handle the stranger like the rest. But the cobra darted at his chin, and bit it, making two marks like pin points. The poor juggler was sobered in an instant. "I am a dead man," he exclaimed. The prospect of immediate death made the maintenance of his professional mysticism a thing of no moment. "Let the creature alone," said he to those about him, who would have killed the cobra; "it may be of service to others of my trade. To me it can be of no more use. Nothing can save me." His professional knowledge was but too accurate. In two hours he was a corpse!

I saw him a short time after he died. His friends and brother jugglers had gathered around him, and had him placed on a chair in a sitting position. Seeing the detriment likely to result to their trade and interests from such a notion, they vehemently asserted that it was not the venomous bite which had killed him. "No, no; he only forgot one little word—one small portion of the charm." In fact, they declared that he was not dead at all, but only in a sort of swoon, from which, according to the rules of the cabalistic art, he would recover in seven days. But the officers of the barracks, close to which the deceased had lived, interfered in the matter. They put a guard of one or two men on the house, declaring that they would allow the body to remain unburied for seven days, but would not permit any trickery. Of course, the poor serpent-charmer never came to life again. His death, and the manner of it, gave a severe blow, as has been already hinted, to the art and practice of snake-charming in Madras.

THE DEAD LANGUAGES.

The custom of Plutarch's time was very different from those of ours, where the greatest part of our youth is spent in learning the words of dead languages. The Grecians, who thought all barbarians but themselves, despised the use of foreign languages, so that the first elements of their breeding was the knowledge of nature, and the accommodation of that knowledge, by moral precepts, to the service of the public and private offices of virtue. By this liberal sort of education, study was so far from being a burden to them, that in a short time it became a habit; and philosophical questions and criticisms of humanity were their usual recreations at their meals. Boys lived then as the better sort of men do now, and their conversation was so well bred and manly, that they did not plunge out of their depth into the world when they grew up, but slid easily into it, and found no alteration in their company.—Dryden.

MOVEMENT FOR THE EARLIER SHUTTING OF SHOPS.

OUR short note on this subject in the publication of the 5th January has brought us a communication from the Committee of the *Association of Drapers' Assistants* (of the city of London) for shortening the *Hours of Business*; from which we learn, that "although a considerable number of employers have expressed their sense of the utility and practicability of closing their shops at the hours requested by the assistants, yet, in consequence of its being necessary for the interest of those parties that the practice should be universal, the object which was sought has not been attained." Our correspondents add, that they have nevertheless been in some degree rewarded for their exertions, by seeing much good result from them elsewhere. "The question which was first raised by them has since been agitated not only in their own trade, but in almost every other, and not only in London, but in almost every considerable town in England. The result has been in some cases the establishment of the hours sought for, and in nearly all cases that of an earlier hour than had hitherto been customary." This is so far gratifying; and we would hope that, in a little time, it may be found possible to effect the same reform in London, an agreement of the principal houses as to a particular hour being all that is necessary for that purpose.

The Committee request us to give a more particular account of the institution from which the shop-keeping classes in Edinburgh derive the benefits of literary and scientific knowledge after the hours of business are closed. It was established about seven years ago, and the movement for an earlier shutting of shops took place about the same time, as a necessary means of enabling the business classes to attend. Men in trade, whether as principals or assistants, may be said to constitute the nine-tenths of the association, and the business is managed by a committee of the members, without any aid from, or connection with, persons of a more elevated grade. From three to six series of lectures are delivered during the course of every winter. Several hundred persons pay a guinea each, for which they are entitled to attend all the lectures that may be delivered: others take tickets for particular courses only, while there is also an occasional attendance, for which sixpence of admission-money is charged. Altogether, the association usually disposes of funds to the amount of four or five hundred pounds per annum. The usual hour of shop-shutting being eight, the lectures commence at half past, and last rather longer than an hour. They take place every evening excepting Saturday, each lecturer having one or more evenings for his particular subject. Chemistry, Geology, Astronomy, Electricity and Galvanism; Natural History, Human Physiology; Phrenology, Moral Philosophy, History; Musical Harmony; the Fine Arts; are among the subjects which have been treated, the lecturers being usually very respectable of their kind, though paid in rather a sparing manner. Females form a portion of the audience.

In Glasgow, associations of the working and shop-keeping classes for hearing lectures are numerous. Our readers will recollect the description given in the *Journal* of the 10th of November, of one which took its rise in a conviction on the part of the advocates of "total abstinence," that some social amusement of an innocent kind was required as a substitute for the vicious ones newly given up. We lately had an opportunity of witnessing a meeting of this body. A large hall was densely crowded by working-men and females, all in decent guise, and on a platform stood a square piano-forte, beside which sat several persons, apparently the directors of the amusements. We heard two comic songs given by amateurs of the operative order, and a beautiful duet from two others: The enjoyment of the audience, who might be five hundred in number, seemed intense. This weekly musical meeting of the working-classes, which costs only two-pence to each person, has been imitated by an association of the trading-class, who meet in the Trades' Hall, and pay sixpence each. Here a lecture of a philosophical nature is delivered, lasting rather less than an hour; after which there is a series of musical performances, vocal and instrumental, and of recitations. The addition of musical to philosophical entertainment seems to us a judicious step; and we hope that the plan will be followed elsewhere.

Since our notice of the Glasgow association in November, we have heard of the establishment of similar societies in different country towns in Scotland, chiefly through the activity of Mr M'Pherson from Glasgow, who has been most zealous in promoting their extension. Among other places, we may mention Dunfermline and Kirkcaldy, both busy and intelligent seats of population in Fife; also Linlithgow, a respectable old burgh in West Lothian. Some efforts, we believe, have likewise been made in Edinburgh to establish cheap musical entertainments of a similar nature, though we have not yet heard of their permanent organisation. There cannot be the least doubt of the success of such associations, so long as they are sustained on a perfectly respectable but unpretending footing, suitable both to the feelings and the pockets of the class for whom they are intended. We may add, that gentlemen amateur players, of whom there are always a certain number in every town, might render no small assistance to such institutions by occasionally affording their gratuitous services.

All of the associations that we have ever heard of are doing good, while in none is there any feature that calls for disapprobation. In fact, they are part, and an important part, of a great movement now going on for the improvement of mankind and the lessening of human pains and sorrows. Let us not forget that, as a preliminary to their very existence, a shortening of the hours of business is in most places necessary. To this cause, then, we heartily wish success: may it be early and complete, and may it be lasting!

NEW USES FOR TURF.

WE have found the following account of the value of turf as applied to the arts, in an Irish paper—the *General Advertiser* of Dublin:—

"Ireland has a valuable resource for its reviving industry in its abundant supply of turf. It has been stated that turf could be had on some of the great inland waters of Ireland at 1s. a ton; but let us suppose that good mountain turf could be had for 2s. a ton, two tons of such may make about one ton of charcoal. Turf is charred in Ireland by two methods. The horse-shoers, in those parts of Ireland where coal is much enhanced by carriage, make turf charcoal in small quantities as they want it: a cone of dry turf is built on hard ground, covered partly with dust—it is then inflamed, closed up with dust, and extinguished by water. But on the Mourne mountains and in Roscommon, a chamber is dug in the bog, filled with dry turf, which, when sufficiently inflamed, is smothered by the wet stuff thrown out to form the chamber in which the charcoal was formed. This process produces a greater quantity of charcoal than the former method, and more cheaply. Two tons of turf, which will make one ton of charcoal, may be had in some places in Ireland for four shillings, whereas a ton of wood charcoal, at the great iron-works in Gloucestershire for instance, will cost four pounds. To compare the prices of these fuels in the British market, we must add the expense of charring and freight to the first cost of that from the Irish turf; still the Irish charcoal will in most places be much lower than the British wood charcoal. But is it as good? Not for the use of the high furnaces which go from forty-five to sixty-five feet of elevation. The pressure of the contents of the high furnace acting on the copious ashes of turf or turf charcoal, may obstruct the draught; but in the processes of refining bar-iron, and in the making of steel, I suppose it to be as good. But charcoal of any kind is not used in many of the high furnaces of Great Britain. In the four great processes by which iron is brought from the ore to finished bar-iron, namely, fusing, refining, puddling, and reheating, one hundred tons of finished bars requires a thousand tons of coals, for four hundred and thirty of which, turf or turf charcoal may be substituted. Under the boilers of the steam-engines that supply power either for blowing the fires, shaping the metal, or for the production of other necessary forces, the use of coals or coke seems unobjectionable; but wherever the fuel and metal are in contact, charcoal gives a better metal than coal or coke, being free from sulphur and other contaminations. The processes for making refined iron and steel enhance the value so much, that refined iron is double the price of cast iron, and the best cast steel has its value increased in a far greater proportion. In all these processes, charcoal must be preferred to coke, and this, next to the quality of the ore, is a chief cause of the superiority of the Swedish over the British iron. Some of the iron-masters of Britain are well aware of the value of turf fuel. The proprietor of a large work in Gloucestershire bought an estate containing turf bog to supply his works: the plan, however, was laid aside, from the difficulty of transport. We have five millions of acres of waste land. Let us suppose half of these are covered with turf bog from one to twenty feet deep, having a specific gravity a little less than water, and containing, probably, four to six parts water, to one of inflammable matter. Of what immense value, then, is the turf we possess and neglect! It could not be all converted into charcoal in a few years; no, and so much the better. But much more turf might be made than can be on the present system, if a plan mentioned in an early number of the *Journal des Mines* was adopted. Turf partially dried was thrown, without order, into a house which was adapted for the communication of heat without flame, and the escape of vapour; in which it was exposed to the heat of 200 degrees Fahrenheit, and rapidly dried; thus the preparation of turf might become a continual employment, independent of season or weather. We therefore command a vast supply of a fuel nearly as valuable as the best used in the British iron-works, and in some situations cheaper than the worst. I have heard that there are extensive iron-works in England where the coals cost more at the mouth of the furnace than 12s. per ton.

In the year 1827, iron was made in Great Britain in 284 furnaces, to the extent of 690,000 tons, which being converted partly into castings, and partly into bars, rods, and plates of malleable iron, was worth £6,290,000. It has greatly increased since. 240 vessels freighted with iron articles sailed from England to America in less than twelve months after the great fire in New York. Here is abundance of fuel in Ireland, and demand in England; how are they to meet? By cheap railroads from the turf mountains to water carriage. The Americans make railroads for £1,000 a mile; we have labour and iron cheaper than they, but it is better to imitate them than the British, who can afford to spend £70,000 per mile on railroads. Where should they first be made? From Dublin to near Lough Bray, where, before the military road was begun, a ten-foot rod was driven into the bog with little resistance. The turf might be conveyed to Dublin by a railroad, and thence to Liverpool; the waggons may descend by their own weight to Rathfriland, and draw up lime, tools, and industrious hands to cultivate one hundred square miles of neglected valuable mountain, adjoining a city where many thousand good labourers are perishing for want of employment.

There will be also a demand for turf, charred or not, for the steam-boats. By this fuel the heat can be expeditiously raised. In London, charcoal is sold for lighting fires. In conservatories, turf charcoal has been found by the Dutch preferable to wood charcoal, when used in open braziers, so as to warm the house without the expense of flues. It was said to answer particularly with orange trees. From a series of four experiments which were made, as detailed in the *Annales des Mines*, and also from experiments carefully made in this country by Dr Stokes, it was found that the calorific power of charcoal made from peat was equal to that of wood charcoal. The experiment by Dr Stokes was the evaporation of a certain quantity of water, by the two descriptions of fuel, in the same apparatus, and under the same circumstances."

A PICTURE OF WAR.

I shall select but one description of a battle scene amongst the myriads which present themselves on every hand. It is from "Napier's History of the Peninsular War," and relates to the scene after the storming of Badajoz:—"Now commenced that wild and desperate wickedness which tarnished the lustre of the soldier's heroism. Shameless rapacity, brutal intemperance, savage lust, cruelty and murder, shrieks and piteous lamentations, groans, shouts, imprecations, the hissing of fires bursting from the houses, the crashing of doors and windows, and the reports of muskets used in violence, resounded for two days and nights in the streets of Badajoz! On the third, when the city was sacked, when the soldiers were exhausted by their excesses, the tumult rather subsided than was quelled, the wounded were then looked to, the dead disposed of! Five thousand men and officers fell during the siege, and of these, including seven hundred Portuguese, three thousand five hundred had been stricken in the assault. Let any man picture to himself this frightful carnage taking place in a space of less than a hundred yards square. Let him consider that the slain died not all suddenly, nor by one manner of death; that some perished by steel, some by shot, some by water, that some were crushed and mangled by heavy weights, some trampled upon, some dashed to atoms by the fiery explosions; that for hours this destruction was endured without shrinking, and that the town was won at last; let any man consider this, and he must admit that a British army bears with it an awful power." I may fairly ask, did Christianity ever contemplate such a scene as this? The wounded were three days and nights bleeding to death—and so were they at Waterloo; and I am entitled to ask, where was it not so?

Cold was the bed where many a graceful form
That day was stretched by death's relentless storm;
In heaps they lay, and agonised with pain,
Filed with the corpses of their comrades slain.
No heart, affectionate and kind, was there,
To soothe their spirits with a parting prayer;
No watchful eye beheld their final hour,
Save that All-seeing and Almighty Power,
Before whose judgment-seat they took their stand,
War in their heart and vengeance in their hand.

—From a Speech at the Peace Society's Meeting.

ABSURDITIES.

To attempt to borrow money on the plea of extreme poverty.—To lose money at play, and then fly into a passion about it.—To ask the publisher of a new periodical how many copies he sells per week.—To ask a wine merchant how old his wine is.—To make yourself generally disagreeable, and wonder that nobody will visit you, unless they gain some palpable advantage by it.—To get drunk, and complain the next morning of a headache.—To spend your earnings on liquor, and wonder that you are ragged.—To sit shivering in the cold because you won't have a fire till November.—To suppose that reviewers generally read more than the title-page of the works they praise or condemn.—To judge of people's piety by their attendance at church.—To keep your clerks on miserable salaries, and wonder at their robbing you.—Not to go to bed when you are tired and sleepy, because "it is not bed time."—To make your servants tell lies for you, and afterwards be angry because they tell lies for themselves.—To tell your own secrets, and believe other people will keep them.—To render a man a service voluntarily, and expect him to be grateful for it.—To expect to make people honest by hardening them in a jail, and afterwards sending them adrift without the means of getting work.—To fancy a thing is cheap because a low price is asked for it.—To say that a man is charitable because he subscribes to an hospital.—To keep a dog or a cat on short allowance, and complain of its being a thief.—To degrade human nature in the hope of improving it.—To praise the beauty of a woman's hair before you know whether it did not once belong to somebody else.—To expect that your tradespeople will give you long credit if they generally see you in shabby clothes.—To arrive at the age of fifty, and be surprised at any vice, folly, or absurdity, their fellow-creatures may be guilty of.—*Newspaper paragraph.*

HEALTH OF LONDON.

Although London stands low, in point of salubrity, in comparison with the provinces of England, it stands very high when compared with most of the continental cities, and even states. With all the boasted advantages of the climate on the Mediterranean shores, the settled salubrious seasons of France, the glowing atmosphere and serene blue sky of Italy, we find England, and even its gigantic, crowded, and almost boundless metropolis, enjoying a greater share of health, and consequently possessing a higher value of life, than the inhabitants of almost any foreign city or state in Europe, or perhaps in the world. It stands with respect to Paris in the scale of health, as 40 to 32; to Leghorn as 40 to 35; to Naples as 40 to 28; to Rome as 40 to 24; and to Vienna as 40 to 22. The mortality in the latter city being as high as 1 to 22, or in other words, nearly five per cent. of the whole population die annually.—*London as it is.*

PRICE THREE HALFPENCE.

THE HEROINES OF BURNS.

It is generally known that the fine impassioned songs of Burns were mostly written with regard to real women—in some instances, of no great beauty in the world's estimation, and in most of very humble rank, but almost always genuine flesh-and-blood women of this world, whom the poet was pleased to admire for the time being. In this respect he was very different from the poets of a former age, with their supposititious Daphnes and Phillises—with Burns, to quote a line of old MacLaurin, Lord Dreghorn,

"— Nelly, not Neera, was her name."

Plain, downright Annies and Nannies, and Tibbies and Jeanies, they were every one of them. He was a great poet—more particularly a great lyrical poet—perhaps we may say the very greatest that has ever lived; and wherever he had been born, there was it certain that the women, whether in silk or druggot, must have been made immortal. He rose in Kyle, amongst a simple peasantry, the female part of which wore short gowns and sometimes no stockings, and were accustomed to wield the muck-fork and the sickle, like the men themselves. But then it was Burns who had alighted amongst them, and the haberdashery of the imagination was ready to deck every one of them as finely as if they had been Sacharissas or Vanessas. It may afford some amusement to the reader to be introduced to such particulars of these persons as have been handed down to us.

We have the poet's own authority, that the first flame in his bosom was kindled in his fifteenth autumn by "a bonnie sweet sonsie lass," who was assigned to him as his partner on the harvest-field. She was unwitting at first of the power she had acquired over him, and he himself did not know, as he tells us, "why he liked so much to loiter behind with her, when returning in the evening from their labours; why the tones of her voice made his heart-strings thrill like an Æolian harp; and particularly why his pulse beat such a furious rattan when he looked and fingered over her little hand, to pick out the cruel nettle-stings and thistles." Love brought poetry to its aid, and he now composed his first verses, beginning "Once I loved a bonnie lass, and aye I love her still"—a very poor set of rhymes truly, but curious as the first tunings of so sweet an instrument. Her name appears to have been Nelly Blair, and, like many of his subsequent flames, she was a house-servant. The daughter of an individual in whose house she at one time served, communicated, through a newspaper, a few years ago, her recollections of Burns's visits on the occasions when "rockings" were held in the house. These were meetings of the rustic youth of both sexes, at which the lasses plied their spinning-wheels (formerly their rocks—hence the name) and the lads knitted stockings, the entertainment consisting of songs, and a light supper of country fare. Often did this lady meet Burns at the head of a little troop, coming from a distance of three or four miles, to attend these meetings, with the spinning-wheel of some lass over his shoulder, and a hundred jokes in his mouth to keep the party in merriment. Often had the lady of the house to find fault with her damself next day, for their lack of alacrity, the result of Burns's too late sitting at his courtship with Nelly Blair.

Another of his very early Dulcineas was a certain Isabella Steven or Stein, who lived near his father's farm of Lochlee. He was then about seventeen. But, alas, she was an heiress—her father a laird; that is to say, the proprietor of probably twenty acres of moorland, with a cot-house and garden. She therefore looked

high, and the consequence was that the poet had occasion to write his song—

"Oh, Tibbie, I hae seen the day,
Ye wadna been sae shy;
For lack o' gear ye lightly me,
But troth I carena by.
Yestreen I met you on the muir,
Ye spakna, but gae'd by like stour;
Ye geck at me because I'm poor,
But fient a hair care I," &c.

Thus we find that in the humblest spheres of life, there are nice distinctions of grade; altogether unrecognisable, possibly, to one observing at a little distance, like that between stars of the fifteenth and sixteenth magnitudes, yet with immense gulfs between, for all that. Tibbie, by virtue of her father's two or three fields, passed like stour the tenant's son whose name was ultimately to be great in both hemispheres.

His next serious fit of passion took its rise while he was studying mensuration at Kirkoswald. The fair maid's name was Peggy Thomson, and he celebrates her in his song "Now westlin win's and slaughtering guns;" she became the wife of a person named Neilson, and long lived in Ayr. But the particulars of this case need not be here entered into, as they have already been introduced to our readers.*

About the time when he was two or three and twenty, his attachments came in such thick and rapid succession, that there is no individualising them. Scarce a lass existed in the happy parish of Tarbolton who had not been a transient object of worship to Robert Burns. There was one whom he celebrates under the name of Montgomery's Peggy. To this girl, who had been reared in rather an elegant way, he made love, merely to show his parts in courtship; he got really in love, and was then refused. "It cost me several heartaches," he says, "to get rid of the affair." Another, named Anne Ronald, the daughter of a farmer, is said to have been the "Annie" of his lively song of "the Rigs o' Barley." The heroine of "My Nannie O," that most exquisite of songs, was Agnes Fleming, the daughter of a farmer at Caldecotthill, near Lochlee, and at one time a servant.

"Her face is fair, her heart is true,
As spotless as she's bonnie, O;
The opening gowan, wat wi' dew,
Nae purer is than Nannie, O."

Was ever rural maid so canonised? He was not only a lover himself, but an abettor of the loves of others. "A country lad," he says, "seldom carries on a love adventure without an assisting confidant. I possessed a curiosity, zeal, and intrepid dexterity, that recommended me as a proper second on these occasions; and I dare say I felt as much pleasure in being in the secret of half the loves of Tarbolton parish, as ever did statesman in knowing the intrigues of half the courts of Europe." We once conversed with an aged man in Tarbolton, who had served Burns partly in the same capacity; they would go together at night to houses in which lived girls admired by the poet; and these girls it was the duty of John Lees to ask out for his friend, who meanwhile waited near the door. When he had succeeded in bringing out any favourite lass of the poet, he became of course *Monsieur de Trop*, and Burns would then say to him, "Now, Jock, you may gang hame." The old man seemed greatly to relish his recollections of these adventures.

At about four-and-twenty, while still assisting his father in the small poor farm of Lochlee, he became acquainted with the young woman whom he addresses in several of his published letters as "My dear E—." From these letters he appears to have at first made

sure of obtaining the young woman's hand, but to have been finally rejected. It is probable that this person was the heroine of his song, "From thee, Eliza, I must go," which seems to have been written when he contemplated leaving her for a distant clime. The letters are in surprisingly pure English, and of a more moderate and rational complexion than the most of his compositions of that class, while the song ranks with his best.

"Farewell, farewell, Eliza dear,
The maid that I adore;
A boding voice is in my ear,
We part to meet no more.
The latest thro' that leaves my heart,
While death stands victor by,
That thro', Eliza, is thy part,
And thine that latest sigh."

Eliza long survived the poet, and, if we may judge from the following obituary notice of her, she must have been a person somewhat above the common standard. "At Alva, on the 28th ult.," in the 74th year of her age, Mrs Elizabeth Black, relict of the late Mr James Stewart, vintner there. Though called upon to discharge the uncongenial duties connected with a humble public-house, and early deprived of her partner, Mrs Stewart, in her guarded walk and conversation, during the many years she spent in Alva, threw such a moral halo around her character as secured for her the unceasing esteem and good wishes of her fellow-villagers. * * She was Burns's ELIZA. She was born and brought up in Ayrshire, and in the bloom of youth was possessed of no ordinary share of personal charms. * * She early became acquainted with Burns, and made no small impression on his heart. * * She possessed several love-epistles he had addressed to her. It was when Scotia's bard intended emigrating from his own to a foreign shore that he wrote the stanzas beginning, 'From thee, Eliza, I must go'—the subject being of course Elizabeth Black."

This brings us to Highland Mary, the most interesting of all Burns's heroines. He was now the joint tenant with his brother of the little farm of Mossiel, in the parish of Mauchline. Mary Campbell, for such was her name, was as lowly a lass as any whom he ever admired, being the dairy-woman at Colonel Montgomery's house of Coilsfield. There is a thorn near the house, beneath whose boughs the poet lover often met his simple mistress. He celebrates her charms, and the happiness he enjoyed from these stolen interviews, in the song of "the Highland Lassie."

"Nae gentle dames, though e'er so fair,
Shall ever be my muse's care,
Their titles a' are empty show,
Gie me my Highland lassie, O.
Oh, were yon hills and valleys mine,
Yon palace and yon gardens fine,
The world then the love should know,
I bear my Highland lassie, O."

The design of going in search of fortune to the West Indies was still upon him, and he is found asking this mistress if she will accompany him:—

"Will ye go to the Indies, my Mary,
And leave auld Scotia's shore,
Will ye go to the Indies, my Mafy,
Across the Atlantic's roar?"

At length he resolved to marry her, and endeavour to remain contented at home; and they met on the banks of the Ayr, "to live one day of parting love," previous to a visit which she was to pay, in anticipation of her marriage, to her relations in Argyle.

* In the 304th number of the Journal, published November 25, 1837.

* The year is recent, but unknown, in consequence of the notice having been out carelessly from a newspaper. It was probably about 1837.

shire. In the song of "Highland Mary," the history of this precious day is written in immortal light. Mary, as is well known, sickened and died at her father's house in Greenock, leaving to the poet an image which never forsook him in all his after days, whether of joy or sorrow. Six or seven years afterwards, when a married man at Ellisland, he observed the anniversary of her death in a way which showed the depth of his feelings respecting her. In the evening, he retired to his stack-yard, in a state of great apparent dejection, and threw himself on a mass of straw, with his face upturned to the sky. There he lay for hours, notwithstanding the kind remonstrances of his wife. When he came into the house, he wrote down, with the facility of one copying from memory, the grandly melancholy hymn beginning,

"Thou lingering star, with lessening ray."

We have treated Highland Mary shortly, for her story has been often told. We shall afford more space to the lady who next presided over the imagination of the bard—the celebrated Jean Armour. The father of this young woman was a master mason or builder, of some substance, in the village of Mauchline. She was rather above the middle stature, of dark complexion, and irregular features, but of a fine figure, and great gentleness of nature, and a very agreeable singer and dancer. According to her own story, she and Burns first saw each other as she was one day spreading out clothes on the green to be bleached. As he passed by, his dog ran over some of the clothes; she called to the animal in no gracious terms, and requested his master to take him off. The poet made a sportive allusion to the old saying of "Love me, love my dog;" and some badinage was interchanged. Probably neither knew on this occasion who the other was; but their acquaintance was not to stop short here. We are enabled to continue its history by John Blane, a decent old man now residing in Kilmarnock, who was at this time Burns's plough-boy and bed-fellow. There was a singing-school at Mauchline, which Blane attended. Jean Armour was also a pupil, and he soon became aware of her superior natural gifts as a vocalist. One night there was a "rocking" at Mossgrill, where a lad named Ralph Sillar sang a number of songs in what was considered rather good style. When Burns and Blane had retired to their sleeping-place in the stable-loft, the former asked the latter what he thought of Sillar's singing, to which Blane answered that the lad thought so much of it himself, and had so many airs about it, that there was no occasion for others expressing a favourable opinion—yet, he added, "I would not give Jean Armour for a score of him." "You are always talking of this Jean Armour," said Burns; "I wish you could contrive to bring me to see her." Blane readily consented to do so; and next evening, after the plough was loosed, the two proceeded to Mauchline for that purpose. Burns went into a public-house, and Blane went into the singing-school, which chanced to be kept in the floor above. When the school was dismissing, Blane asked Jean Armour if she would come to see Robert Burns, who was below, and anxious to speak to her. Having heard of his poetical talents, she said she would like much to see him, but was afraid to go without a female companion. This difficulty being overcome by the frankness of a Miss Morton—the Miss Morton of the Six Mauchline Belles—Jean went down to the room where Burns was sitting, and from that time her fate was fixed.

The subsequent history of this pair is well known. Jean ultimately became the poet's wife, and the partner of all of weal or woe which befell him during the Ellisland and Dumfries periods of his life. It is rather remarkable that, excepting two or three passing allusions, Jean was not the subject of any poetry by Burns during the earlier period of their acquaintance, nor till they were seriously and steadfastly married. He then, however, made up for his former silence. It was during the honeymoon, as he himself tells us, and probably while preparing a home for her on the banks of the Nith, that he composed his charming song in her praise—

"Of a' the airts the wind can blaw,
I dearly like the west,
For there the bonnie lassie lies,
The lassie I loe best;
Though wild woods grow, and rivers row,
Wi' mony a hill between,
Yet day and night my fancy's flight
Is ever wi' my Jean.
I see her in the dewy flowers,
Sae lovely, fresh, and fair,
I hear her in the tunefu' birds
Wi' whisla charm the air;
There's na a bonnie flower that springs,
By fountain, shaw, or green,
Nor yet a bonnie bird that sings,
But minds me o' my Jean."

Not long afterwards, he infused his love for her into the still more passionate verses beginning, "Oh, woe I on Parnassus Hill!" of which one half stanza conveys a description certainly not surpassed, and we are inclined to think not even approached, in the whole circle of British poetry—the vividness and passion rising in union from line to line, until at the last it

reaches a perfect transport, in which the poet involves the reader as well as himself.

"I see thee dancing o'er the green,
Thy waist sae jump, thy limbs sae clean,*
Thy tempting lips and roguish een—
By heaven and earth, I love thee!"

Mrs Burns is likewise celebrated in the song, "This is no my ain lassie," in which the poet describes himself as meeting a face of the fairest kind, probably that of some of the elegant ladies whom he met in genteel society, but yet declaring that it wants "the witching grace" and "kind love" which he found in his "own lassie;" a very delightful song, for it takes a fine moral feeling along with it. Of "Their Groves o' Sweet Myrtles" we are not so sure that Mrs Burns was the heroine, though, if the wives of poetical husbands always had their due, she ought to have been so. Jean survived in decent widowhood for as long a time as that which formed the whole life of the poet, dying so lately as March 1834. She was a modest and respectable woman, and to the last a good singer, and, if we are not greatly mistaken, also a tolerable dancer. She had been indulgent to her gifted though frail partner in his life, and she cherished his memory when he was no more.

Here for the present we must stop: the Ayrshire poet somehow contrived to admire so many ladies, that there is no rumpling them all into the compass of a single paper. We shall speedily resume the subject.

POPULAR INFORMATION ON SCIENCE.

ANIMALS PRESERVED IN TIMBER AND STONE.

MANY instances of the discovery of torpid, but still living animals, inclosed in timber and stone, where they must have been secluded from air and nourishment for long spaces of time, are on record; but the phenomenon has never, as far as we are aware, engaged the attention of men of science, probably from a dread which these men seem to have of the vulgarly wonderful. The phenomenon has certainly been, as it could not fail to be, the subject of vulgar wonder; but yet it is one which is also calculated to throw some valuable light on matters of science, as we hope to show before concluding the present paper. We shall, in the first place, enumerate a variety of cases.

Mr Smellie mentions, in his *Philosophy of Natural History*, that, in the *Memoirs of the Academy of Sciences* for the year 1719, we have an account of a toad found alive, and healthy, in the heart of an old elm. He also mentions that in the year 1731, another was discovered in the heart of an old oak, without any visible entrance to its habitation: "from the size of the tree," he adds, "it was concluded that the animal must have been confined in that situation at least eighty or a hundred years." Monsieur le Cat, a member of the Royal Academy of Sciences at Rhodan, in 1756, published a paper on this subject, in which he mentioned several remarkable instances of the phenomenon—as the finding of two worms in the centre of a block of marble by the statuary of the king of Spain, a crayfish in the midst of a piece of marble near Tivoli, and a number of frogs at Guadeloupe in the rock through which the king's physician there was digging for water. At Cassel, about this period, in a stone quarry, three toads were discovered lying together in a cavity of the rock: they were at first quite lively, but died in half an hour.

Of the discovery of single toads in large blocks of stone, the instances are so numerous, and so much alike in their details, that it would be tedious to state them all, or any considerable number of them. In most of the instances that have fallen under our attention, the animal is described as lying in a hole of about its own size, the sides of which were discoloured. In all cases, the animal appeared torpid at first, but speedily became reanimated, and lived for a little while, usually about an hour, but sometimes for a much longer space. Sandstone appears to be the species of rock in which such animals are most frequently found, and usually the original situs of the animal is stated to have been at a considerable depth under ground. The *Gentleman's Magazine* for April 1773 mentions a large live toad having been found in a lump of coal at the Lathom coal-works in Lancashire, a hundred and eighty feet under ground.

In Chillingham Castle, the splendid old seat of the Lords Tankerville in Northumberland, there was once a chimney-piece of sandstone, from which a live toad was said to have been taken. The circumstances, as far as known, were thus described by a topographical writer about sixty years ago:—"In that part of the chimney-piece of the hall, which lay transversely from side to side, there was a hole of an irregular figure, plainly corresponding with the parts of an animal. Its greatest length was about seven inches, and its greatest depth, which was in an oblique direction, about five. The inside was encrusted with a dark brown substance, of a close texture, that was perfectly smooth and even, as if it had been polished. In another chimney-piece, at Harton Castle, there was a like hollow, nearly of the same dimensions, which ap-

peared to be the other half of the mould; but both are now destroyed. That part of the stone which was at Harton, has been broken and defaced, I know not how; and the late Earl of Tankerville having a few years ago caused a window to be made where the fireplace was, this part of the chimney-piece was broken by the workmen, and built into the wall. There is, however, still remaining a large frame that used to hang over the mantel-piece, in which is the resemblance of a coat of arms, a large toad in the field, the crest a toad-stool, with a less toad upon it; the mantling is of snakes interwoven; the carving on the frame itself is serpents and effets, and the following inscription is written in large letters of gold, in two ovals, one on the left side of the arms, and the other on the right." [The inscription we omit, as it is in very quaint Latin, but what follows is a translation of the first part of it:]—

Hither, Stagyrte,
If you would see a phenomenon more wonderful than Euripus,*
Come hither;
Let seas ebb and flow as they may, and let him be a Lunatic
Who despoils the moon of her (tidal) honours.
Behold here a novelty, such as neither Africa presents to thee
Nor the Nile with her fabulous sands—
A fire and pure flame,
Existing though shut out from vital air.
From the dark recesses of the cut rock which you see,
The hands of the obstetrical stone-cutter gave light
To a living toad.

Notwithstanding the numerous cases of the discovery of stone-inclosed toads, which have been from time to time laid before the public, many naturalists in modern times have professed not to be convinced that such a thing is possible in nature. Sir Joseph Banks was of this number: he said, that in his whole life he never, with all pains, could trace such a tradition or account to any credible authority, so that it could be recorded as a fact. In consideration of this incredulity, and to set the bare question of possibility at rest, the Rev. Mr Comber, rector of Oswaldkirk, near Brough, in Westmoreland, was at the pains to obtain a regular affidavit before a magistrate, respecting the finding of a frog in a huge block of millstone grit on Stainmoor, by four men engaged in repairing a highway. This event took place on the 25th July 1832. The four men, in their declaration, say that they "were astonished, on splitting a large block of more than a ton weight, by a lively yellow frog springing out of a cavity in the centre of the said solid rock, where it had been as closely embedded as a watch in its outer case, without any communication with the surface nearer than eight inches. The said frog was taken up by one of us, when it discharged a considerable quantity of black fluid; it was safely conveyed to Brough, and given to Mr Rumney, junior, surgeon, in whose possession it now (January 21, 1833) continues, in a healthy lively state." The whole document is printed at length in the *Gentleman's Magazine* for August 1834; so that, we presume, the fact of the existence of live animals of certain kinds in situations where they must have been shut up from air and light for ages, can no longer be reasonably disputed.

Out of a number of cases of toads found in timber, which have come under our attention, we shall quote one which was stated a few years ago in an American journal: we are unfortunately unable to give the date, or the name of the work:—"A short time since, we published an account of the discovery of a snake, inclosed in a solid mass of hard coal, at the depth of 150 feet from the surface of the ground, in a coal-pit in England. The following article, communicated from Middleton, Connecticut, contains a parallel case of a different animal, inclosed in a different but not less extraordinary prison in this country:—At Mr Stephen Miller's mill, in that place, was sawed an uncommonly large pine log, from which six boards were taken out of each side. The log contained 220 rings or grains, one of which is annually formed by the growth of the tree. In the middle of the log was found a hollow place about two feet long, and about the size of a man's hat crown. When the tree was felled, the hole must probably have been nine or ten feet from the earth. From this hollow place, when opened at one end by the saw, hopped out a pretty large toad, rather blacker than usual, and displaying as much activity as is common to its family. After a few hops it jumped down the sawpit, plunged into the mill-pond, and disappeared. As there was no hole in the sides, or in any part of the log, except directly in the centre, it is supposed by some that when the tree was young, the toad, then probably extremely small, had crept into some little defective aperture, since closed up by the growth of the tree, and had remained there ever since, gradually more and more inclosed, as the pine increased in size. As the tree grew, the hole must have grown in proportion; so that, in process of time, the toad must of course have been greatly relieved from his cramped position, and finally accommodated with a snug drawing-room, to which nothing was wanting but the company of his friends.

If, according to the Pythagorean doctrine of transmigration, this recluse had once been a MAN, and if

* Euripus was the name given to a portion of the *Ægean Sea*, near the island of Eubœa, which was said to present the remarkable phenomenon of a tidal ebb and flow seven times in the twenty-four hours. Judging from this inscription, Euripus seems to have been one of Aristotle's great marvels. On this the inscription is founded. The sands of the Nile are called "fabulous," because it was said they gave birth to animals. Shakespeare, who seems to have known all things, says, "Your serpent of Egypt is bred now out of your mud by the operation of your sun; so is your crocodile."

* This phrase is apt to displease an English ear: but the displeasure vanishes when its Scotch meaning is understood—namely, the reverse of clumsy.

the wand of an enchanter could have restored him to his human form and voice, it would have been pleasant to learn from him some particulars of our country at the distance of two centuries past, and to listen to garrulous old age recounting the history of days of yore. He was, probably, when released from prison, the oldest living creature in the United States. Admitting the HUMANITY of the toad, conjectures might vary, whether, in his pristine form, he might have been an Indian Sachem of the Pequot or Mohegan tribes, or one of the old settlers of Plymouth, New York, or Virginia. A calculation of probabilities, founded upon the supposed period of his incarceration in the tree, would naturally incline minute chronologists to the adoption of the former conjecture in preference to the latter.*

It becomes of importance to ascertain what are the animals which are occasionally found in these situations. Toads are certainly the species most frequently found; and the reader has seen recorded an instance in which the prisoner was a frog. In August 1821, at Auchtertool, in the county of Fife, as David Virtue, a stone mason, was dressing a block of sandstone, with a view to its serving as a millstone, he found, embedded in it, a *living lizard*. The account of the circumstances in Tilloch's Philosophical Magazine states that the creature "was about an inch and a quarter long, of a brownish-yellow colour, and had a round head, with bright sparkling projecting eyes. It was apparently dead, but after being about five minutes exposed to the air, it showed signs of life. One of the workmen very cruelly put snuff in its eyes, which seemed to cause it much pain. It soon after ran about with much celerity, and after half an hour was brushed off the stone and killed. When found, it was coiled up in a round cavity of its own form, being an exact impression of the animal. This stone is naturally a little damp; and about half an inch all round the lizard was a soft sand, the same colour as the animal. There were about fourteen feet of earth above the rock, and the block in which the lizard was found was seven or eight feet deep in the rock; so that the whole depth of the animal from the surface was 21 or 22 feet. The stone had no fissure, was quite hard, and one of the best to be got from the quarry of Cullaloe, reckoned perhaps the best in Scotland." In May 1837, at Buckhaven, in the same county, as some workmen were quarrying stones on the beach for the erection of a harbour, they discovered a cavity fully eight inches deep, in which was a fish about six inches long, resembling the kind called in that place a *sea-cat*. When taken out of the stone, it appeared stiff and dead, but in a short time it began to show symptoms of animation, and it lived for a few hours. Round the inside of the cavity, there was a fine coat of clay, about a quarter of an inch thick.* In November 1820, as a woodman in the employment of Mr Pringle of Clifton was engaged in splitting timber for railings in the woods close by the lake of the Hlaining, near Selkirk, "he discovered in the centre of a large cherry-tree a *living bat* of a bright scarlet colour, which he foolishly suffered to escape, from fear; being fully persuaded (with the characteristic superstition of the inhabitants of that part of the country) that it was 'a being not of this world.' The tree presents a small cavity in the centre, where the bat was inclosed, but is perfectly sound and solid on each side."—*Caledonian Mercury of the day*. Though we consider it worth while to include this case amongst others, we cannot allow it to pass without the remark, that the nature of the animal in question could scarcely, in the circumstances, have been very correctly judged of by the woodman.

In December 1827, as some workmen in the employment of Mr Atkinson, cabinet-maker, Liverpool, were sawing up a log of zebra-wood, fourteen feet long, and four feet and a half square, they found near the centre, an insect, about two inches long, and rather more than an inch in circumference, resting in an oblong cavity, a little wider than the bulk of its own body. It had apparently eaten its way a few inches through the wood. A naturalist, to whom the creature was shown, pronounced it to be the larva of some species of *Prionus*, and said that, in proper circumstances, it would go through the two ensuing stages of its existence, and be in the second a splendid winged insect. Such larvae are sought for in recesses within trees in America, and eaten by the natives as a delicacy. The creature continued to exist for some time in a box, manifesting great activity in the use of its mandibles.

It would thus appear, as far as authentic accounts are to be obtained, that the animals found inclosed in rock or timber are all of them inferior to the mammal class; that the kinds most frequently found are of the fish and reptile classes; and that, in some instances, insects and crustacea are found so inclosed.

In two points, philosophy seems called upon, in an especial manner, for explanation—how were the animals so placed, and how have they been kept in existence during such a long course of years? With regard to the first question, we conceive it to be sufficiently answered, with respect to stone inclosures, by the well-known facts developed with regard to the formation of rocks. The kinds of stone forming the inclosure are invariably sedimentary, that is, formed as a residuum of heavy matter at the bottom of collections of

water. When the bed of rock forming the Cullaloe quarry was a soft mass of sand, there could be no difficulty in the deposition of a toad or lizard within its ample bosom. Many animals are found in a fossil or petrified state in that class of rocks, and the only difference between the two cases is, that in the one life has been preserved, while, in the other, it has been extinguished, and the mass of the animal's body transformed into the same matter as the surrounding rock. It would thus appear that the inclosed animal, in which life has been retained, must have possessed, by virtue of that life, a power of resisting the influences which petrified its dead companions—a power in some measure analogous to that possessed by the living fibre of the stomach to resist the action of acids which immediately dissolve dead animal matter, and even corrode the hardest metals.

With regard to animals inclosed within trees, it must be obvious that they had sought a temporary home or shelter in what was a chink in the timber when they entered; that they must have there fallen into a state of torpor; and that, during their sleep, the chink had been closed up, so that the influences which usually awake torpid animals to new life never visited them, and they were allowed to slumber on for ages.

This brings us to the phenomenon of the very long protracted life of the stone-inclosed animals. First, as to the length of life experienced by these creatures. We here derive some light from the researches of modern geology. The rocks in which such creatures are found are usually of the less ancient formations. The millstone grit, in which a frog was found upon Stainmoor in 1832, is one of the newest rocks; and sandstone, in which so many others have been found, may be called middle-aged. Still, with respect to ordinary chronology, these rocks are of vast antiquity. It is not by any means extravagant to suppose that the toad found at Lathom coal-works—which leapt out from its recess at an old woman's fireside, and for some days ate, breathed, and performed all its natural functions, as well as its obscure brethren generated a few months before in the neighbouring ditches—was many thousands of years old. How, it must be asked, has life been protracted for so great a length of time, without any of its usual supporting means? The mind here naturally adverts to the familiar wonder of *hibernation*, or that state of dormancy in which some animals pass the winter; but we find that it is the opinion of M. Geoffroy St Hilaire, a first-rate authority on such matters, that the state of the stone-inclosed animals is different from this, and we rather think that the appearances justify his conclusion, the condition of an animal during hibernation being by no means one of complete torpor. According to this eminent naturalist, "we must conclude that there exists, for organisation under such combinations, a state of neutrality intermediate between that of life and death—a state into which certain animals are plunged in consequence of the stoppage of respiration, when it takes place under certain circumstances. This," he adds, "is observed in a certain degree in the crustaceous animals; vital action is probably suspended in them in such a manner that the excitation of certain agents is required to awaken them and put them in motion." It is perhaps no very bold venture to suggest that the condition under which this torpor commenced was—at least in certain of the creatures concerned—that of freezing. When the attendants of Captain Franklin fished in the Coppermine River, the fish froze as they were taken out of the nets. In a short time they became a solid mass of ice, and by a blow or two with a hatchet were easily split open. If, in this completely frozen state, they were thawed before a fire, they recovered their animation. Now, suppose that the fish found in the rock at Buckhaven had, when frozen by some chance, been inclosed in a mass of sand, and that, while it continued in that state, the sand became hardened, so as to close it up completely from all influences which could alter its condition, it seems no more surprising that it should have retained life for hundreds of thousands of years, than that it should have done so for a month or a week. As it is well known that frogs, found frozen in ice, also recover their animation when thawed, the protracted existence of that class of animals is in like manner accounted for. Nor, when we recollect Dr Franklin's anecdote of the flies which he took from a bottle of Madeira and revived in the sun, do we find any difficulty in supposing that creatures of that grade in creation may have preserved life for ages, in cavities within stone and timber, not perhaps by virtue of being frozen, but by being thrown by other means into a state of torpidity equivalent to that condition. It is to be kept particularly in mind, with regard to this torpid state, that it supposes a complete cessation of all the animal functions. No waste can take place in such circumstances; consequently, there can be no need for food. The lungs or gills are arrested in their play; consequently, there can be no need for air. At the same time, the fibre and juices of the animal's entire system are thoroughly preserved, so that no corruption or deterioration of any kind can befall them. Hence, when the state of torpor ceases, the life and all its proper functions recommence, whether at the distance of a few months or of unnumbered centuries.

Should these views be correct, a curious geological question will arise. The plants found in the sedimentary rocks, under what are now temperate and even frigid latitudes, are of the kinds which now grow in warm countries only. Hence it has been presumed

that a high temperature once prevailed at those parts of the earth. Whether this high temperature was occasioned by propinquity to the sun's course, as in the tropical countries of the present day, or by some local circumstances, such as the existence of deep sun-exposed recesses in the earth's surface, or by other and unknown causes, are points as yet unsettled amongst geologists. Now, here comes in a new fact, seemingly proving that low degrees of temperature, sufficient to freeze animals into torpidity, had also prevailed occasionally in those climes. How far existing theories would require to be modified in order to admit this new fact, we shall leave to more profound speculators in this interesting science than we can pretend to be.

THE CONTINENTAL BLOCKADE,

A STORY.

THE Continental Blockade was one of the gigantic ideas of Napoleon. Master of the whole of Europe, either directly or indirectly, he still found all his schemes thwarted by the indomitable opposition of England, and, to weaken this enemy, whose whole strength and wealth lay avowedly in her commerce, he exerted all his power to close the ports of the continent against her shipping. To a certain extent, he was successful. Almost the whole line of the shores of Europe was blockaded against the British shipping; but the natural consequence was, that a contraband system was established, which undid the effect of the whole blockade. Even France itself, which might be supposed to follow up the emperor's wishes with the greatest strictness, had been too long accustomed to depend on Britain for commercial supplies, to be able to do entirely without them. In spite of the closest watching on the part of Napoleon's officials, large quantities of smuggled goods were introduced from Britain into the Channel coasts of France. It was at one of the French ports in this quarter, that the following incidents took place, which will be more intelligible after this explanation of the state of matters at the time of their occurrence.

The port in question, like others in France, had suffered severely from the blockade, in as much as its shipping lay idle and useless, through fear of the terrible enemy which held the mastery of the seas. The inhabitants of the port consequently endured very considerable privations, and a portion of them were not unwilling to profit by the visits of smugglers from the other side of the Channel. Others, again, and among these all the old sailors who had fought against Britain, would have died sooner than have smoked a bit of tobacco, or drunk a glass of rum, that had been brought into the port in violation of the blockade. One day, an old privateer captain, named Scipio, was seated with a number of old mariners like himself, on the deck of the *Halecyon*, a dismantled hulk which Scipio had taken in other days from the English, and which now stood in a corner of the harbour, converted into a stationary residence for the privateer and his associates. "Is it not shocking," said Scipio to his companions, "that the port should have abundance of tobacco, sugar, coffee, and other articles, when it is certain that for many weeks not a merchantman has cast anchor in the harbour?" "Shocking," repeated every one around. "My friends," said Scipio, "we are daily and nightly betrayed. The blockade is not respected. Though we have custom-house officers and coast-guards, they are worth nothing. There is some connivance between the townspeople and the English, which enables the smuggler—for it is one vessel, I am convinced, that does the whole mischief—to approach the coast, always at the very moment when the coast-guard are out of the way. These wretches of grocers would sell their country for profit." "If you are right, Master Scipio," said one of the seamen, "the smuggler should not be far off now, since the guard-sloop is gone for a day or two." Scipio turned his head slowly to the west as he heard this remark, and gazed on the long line of blue waters before him. In an instant he cried, "My glass! my glass! that villainous smuggler is there again!" The old privateer's telescope was handed to him, and, after arranging it, he sank gradually on one knee, and swept the horizon with his experienced eye. From sea he turned his gaze to land, and examined that portion of the prospect with equal attention. "What, in the name of wonder, brings that girl in the blue robe so often to that rock by the sea side? And at such a distance from the town too! She must have a purpose!"

The old mariners around could not comprehend the meaning of Scipio's remark. "The smuggler," said one, "what of the smuggler?" Scipio rose smartly to his feet, as if roused from a reverie. "The English smuggler is about to land somewhere not far off this night, my friends; and shall we allow it? No! though the guard-sloop be away, we shall find some boat or another to carry us to sea, and I am sure we are men enough, old as we are, to stop for once the smuggler's pranks. I shall go this instant, and demand letters of marque from the commissary of marine. There is treachery somewhere, my friends, but we shall make the blockade be respected!" The ancient mariners cheered old Scipio with spirit, as he departed on his errand to the house of the commissary. "We shall make the blockade be respected," cried they.

Scipio was not long in reaching the house of the commissary, from whom he had to receive the letters of marque, or commission, necessary to enable him to

* The particulars of this case are obtained from the *Fife Herald* and *Edinburgh Courant* newspapers.

fulfil the purpose he had in view. But when he arrived at his destination, he found that the commissary was just about to sit down to dinner. A servant, however, showed him into an elegant hall, and promised to announce his wish to see the commissary. Scipio sat here for nearly half an hour, biting his nails at the thought that the night was advancing, and the smuggler would soon have his business done. The impatient old privateer, at length seized the bell-rope, and rang it violently. A servant reappeared, and, after an apology, on account of there being company at dinner, informed Scipio that the commissary would be glad to hear his business to-morrow. "To-morrow!" cried the veteran; "tell your master that I want a letter of marque, that the English smuggler is in sight, and that in an hour or two, if not prevented, his cargo will be landed, and the blockade broken!" The domestic disappeared, and soon returned with a message to Scipio to wait till after dinner. Scipio sat down, thinking the meal might be soon over. But first course, second course, and dessert, successively passed by under the eyes and nostrils of the privateer, and more than an hour was taken up with them. Scipio was now enraged beyond bounds, and he burst through the crowd of servants into the dining-room, where the commissary of marine sat at the head of a splendid party. "Master commissary!" cried the angry and unceremonious seaman, "why have I been kept waiting for nearly two hours in your hall, when I only want a slip of paper, and when you have been told that a smuggler is on the coast, and is violating the blockade?" The guests sat astonished at this speech. "I don't require to be taught my duty," cried the commissary; "leave the house, fellow." "I will go," returned Scipio, in tones as high; "but I will say to the whole town that you have refused me a scrap of writing which would have given me the right to battle these foes of my country! There are traitors here! There are some who know but too well the place and the hour for the smuggler's descent—" Suddenly the irritated veteran came to a pause. His eye had fallen on the young daughter of the commissary, and he remained gazing upon her in a species of stupor. This pause in the angry discussion gave an opportunity to a young lieutenant in the naval service, who was present, to rise and approach the privateer. Scipio permitted the youth to lead him out of the room and the house without a word of resistance. "Scipio, my old friend," said the lieutenant, when the two were alone, "what is the cause of this conduct?" "Oh, Master Augustus, it was I who made a man, a seaman of you; and if you have any kindness for me on that score, get me a letter of marque, and a boat of any kind, and let me go and punish that rascally smuggler!" "Your demand may be reasonable, or may not, Scipio," said the young officer, "but you took a strange way to prefer it to the commissary, and on the night, too, of his only child's betrothing." "What! that girl whom I saw just now?" asked the old mariner. "Even so," was the reply; "that very young lady at whom you stared so strangely." "And to whom may she be betrothed?" said Scipio. "To me, my old friend," returned the lieutenant. Scipio gave a long "whew!" and then was silent for a minute or two. "Master Augustus," said the veteran at length, "you will have a wife who is strangely fond of the sea-shore." "I do not comprehend you, Scipio," said the youth. "Ah, Master Augustus," replied the old privateer, gravely, "beware how you marry that girl. Well might I look in amazement at her. She is an enemy to her country, or has some base connection with its enemies. For several months past I have seen her clamber along the rocks, day after day, at some distance from the port; and I am certain that it is she who gives signals to the English smuggler, and lets him know when it is safe to land his cargo." "Scipio, you are mad!" exclaimed the officer; "the daughter of the commissary of marine, my Cecile, give signals to a smuggler! This is pure raving!" "It is no raving, Master Augustus," returned the veteran; "I cannot be mistaken. The dress, the figure, every thing tells me that she is the same person on whom my glass has been fixed a thousand times. Ah, beware, Master Augustus!" The young officer was confounded by the old seaman's pertinacity in making this assertion. "Come to-morrow evening to the Halcyon," said Scipio, "and you will probably be convinced by the evidence of your own eye-sight." The bewildered lieutenant gave his consent to this arrangement, ere the two parted for the evening. Scipio was so strongly attached to the youth, that this discovery, so deeply affecting his happiness, drove the letters of marque almost out of the old man's mind. Too much time, besides, had been spent to render them now available. But the privateer was right. On the following day, it was well known in the town that the English smuggler had discharged a cargo not far from the port.

For several successive evenings after the one described, Scipio and the young officer of marines watched the rocks along the coast from the deck of the Halcyon, and on each occasion were disappointed. No Cecile, nor any body resembling her, appeared to confirm the veteran's statement, and Augustus by degrees became convinced that Scipio's conjecture was utterly unfounded. The daily sight of Cecile was enough of itself to overthrow all jealous suspicion. As the enamoured officer gazed on her slight but exquisite form, and her lovely countenance, as yet almost childish in its beauty, or listened to her sweet voice as it accompanied the motion of her delicate fingers on the harp, he thought he must have been mad to imagine for one moment that a creature so young, so tenderly nurtured, should take

up the task which Scipio had assigned to her, even if it could be supposed that her father should be so false to his official trust as to countenance the contraband trade. And then, as to the chances of her loving another, how could the lieutenant believe this to be the case when her truth-speaking lips so openly avowed her affection for himself? No, no; Scipio had seen some fisherman's daughter on the rocks, if he had seen any body at all. Such was the train of thought that passed through the mind of Augustus as he sat by the side of Cecile on the fourth or fifth day after their betrothal. "But a few days now, Cecile," murmured the lover, "and you will be mine—mine for ever." "Would that the time were come, Augustus," said the daughter of the commissary. "Fool that I was to doubt her love!" thought the officer. "Ah, Cecile!" said he aloud, "you make me too happy." At this moment the pair were interrupted. The commissary himself entered the room, a cold, stern, reserved person, most unlike his daughter in seeming temperament. "Augustus!" said the commissary, "there are bad news of our cruisers. You will have to depart to-morrow for the eastern part of the Channel." Cecile grew pale, and cast her eyes on the ground; and when she raised them to reply to the adieu of her lover, they were filled with tears.

On the morning, Augustus set off to join the frigate to which he was attached. On the evening of the same day, Scipio sat at his post on board the Halcyon, with his glass in his hand. His gaze was turned long, long to sea, and at length he directed it to the land. He had no sooner done so, than a sort of yell escaped him. "Is not this horrible, abominable!—the very day of his departure!" cried the old seaman; "there she is again on the rocks; her blue dress, her figure, nay, her face, her mouth, her eyes—I see them all as plainly as if she were two paces off! It must be she! Treacherous, wretched girl! Oh, my poor Master Augustus!" As Scipio uttered these exclamations, he turned his glass again to sea. "By heavens, there goes the smuggler already! Already does he know the time to be favourable, and again the blockade will be broken, while I lie here idle, and can do nothing." Convinced of the connection of the commissary with the smuggler, Scipio did not again go on the needless errand of seeking letters of marque, but formed many bitter resolutions of exposing him. At the same time, Scipio prayed most earnestly for the speedy return of Augustus. The old man was gratified in his wish. Scarcely had night closed in, when the frigate to which Augustus belonged entered the harbour with a rich prize—two English East-Indiamen. The young officer landed immediately, and went to visit Cecile. The daughter of the commissary listened with an obvious mixture of fear and delight to her lover's narrative of the capture of the two vessels. She separated his long light tresses to see if he spoke true—if the bullets which had passed over his head had not wounded him. She pressed his hands in hers; she was so happy! But Augustus was abruptly called away from this interview. It was Scipio who sought him. What was the result of their interview, will be immediately seen. Suffice it to say, that the frigate had not been many hours in the harbour ere she again stood to sea.

On the ensuing morning, the people of the town beheld a stirring sight. At a short distance along the coast, the frigate was seen hemming the well-known smuggler close in to the land. After an attempt to escape on several tacks, the smuggler ran almost upon the rocks. The frigate could not follow it without danger, but a boat full of armed men soon left the frigate to board the contraband vessel. There was yet one chance of escape for the smuggler. To seaward was the frigate, and on one side was the fort of the town, shutting out all chance on these quarters; but on the other side was a narrow passage between a large sunken rock and the shore, which might yet permit an escape, for through that passage the frigate could not have attempted to follow. But the question was, whether or not the smuggler knew of this passage? Apparently it did not; for it seemed to await the approach of the boarding-party, at the head of whom was Augustus, with his trumpet in his hand. Scipio, too, was in that boat, for the veteran had pressed to be taken on the service. The boat was nearing the smuggler, and it was the hope of all that the contrabandists were ignorant of the passage, when suddenly a girl, dressed in blue, appeared on the rocks, and gave a signal to the smuggler to throw himself into the pass! The signal was noticed by those in the boat, and indeed by all. The trumpet fell from the hand of Augustus as he beheld that girl's figure. But some of the men, in the irritation of the moment, raised their guns to their shoulders. "Fire!" cried Scipio. "No, no! it is in sport," cried Augustus. But his words came too late. One of the men fired, and the upraised hand of the girl fell to her side. In a moment after, her body was seen to fall prostrate behind the rock where she had appeared. The signal was not in time to save the smuggler, if indeed it was fully understood. There is no necessity for detailing the particulars of the capture which followed. It is enough to say that the smuggler was taken, brought into the harbour, and its whole cargo publicly burnt on the streets of the town, amid the acclamations of the multitude. The commissary of marine officiated as the regulator of the burning, and threw the first article into the fire with his own hands. The commissary was somewhat pale at the moment, but by his side stood a young officer, whose colour was that of a corpse.

Some weeks after this affair, a letter reached Augustus.

It was written from a convent. Part of it ran thus:—"Ere I knew what purposes I was furthering in so doing, I was ordered often, often, by my cruel father, whose strongest passion was avarice, to appear on these unhappy rocks; and when I did become aware of all that lay under the proceeding, I sought to free myself from the task, but could not. Suspicion was more unlikely to fall on me than others. My stern parent's influence over me was beyond my power to escape from; and at the very last, on the day of the smuggler's capture, he compelled me to make an attempt to save the vessel. I longed for our union, Augustus, because I loved you; but I also longed for it to rid me of this most unnatural servitude. * * * I know you will pardon me, beloved, and the thought will sustain me under our endless separation. Earlier would I have written, but for my wounded hand; it is now almost well. Adieu."

Some years after this period, Augustus de Bussy was a married man. His wife was a beautiful woman, but it used to be remarked by all her friends as a very odd circumstance, that she always wore a glove on one of her hands. The reader, however, will not wonder much at this circumstance, for he will conjecture, and rightly, that Cecile was the person in question. As long as the commissary lived, Augustus, though he kept the strange old man's secret, never could bring his mind to think of connecting himself with such a being; but when the commissary died, which took place within two years of the affairs related, the young officer took Cecile from the convent where she had found a refuge (although she had not become a member of its sisterhood), and made her the mistress of his home. Old Scipio, notwithstanding the thoughts he had once entertained of her, was happy in being allowed to teach the mysteries of ship-building and ship-sailing to the little ones who had her blood in their veins.

Thus closes our episode of the Continental Blockade.

OCCASIONAL NOTES.

A NEW WORD.

The Americans never scruple to coin a new word or revive an old one, when they find occasion to do so. The last of their revivals is the word "colluded"—the preterite of the verb "to collude," which may thus be inflected, collude, colluding, colluded. To collude, signifies to enter into a collusion. When we, therefore, would use the phrase, "they entered into a collusion," the Americans would say, "they colluded," which saves circumlocution, and is justified by its use amongst old writers.

PLAN FOR DIMINISHING LITIGATIONS.

Some time ago, in looking over a file of English newspapers, we chanced to see a paragraph which contained a good idea, worthy of being acted upon. This was the projection of a plan for preventing the more common kind of litigations; in other words, a scheme for settling disputes in a cheap, peaceful, and expeditious manner. The broaching of such an idea has no doubt been suggested by the well-known delays and heavy expenses incurred in ordinary litigations. According to the practice now in use, lawyers have to be employed, and the case is appealed from court to court, all manner of shifts and delays are resorted to, and when actually terminated, the cost of the suit is perhaps more than the suit is worth. With the hope of avoiding some of these evils, contending parties frequently submit their case to an arbitrator, binding themselves to abide by his decision. This, however, is seldom satisfactory. Arbitrators often take years to settle a case, even of a simple nature, which has thus been brought before them, and it is impossible either to hasten them in their decision, or to prevent them from loading the suit with expenses for witnesses, reports of persons whom they consult, and fifty other things, that strike them as necessary for the settlement of the dispute. From one or all of these causes, a written obligation to submit to an arbitrator, or to an oversman upon two arbitrators mutually chosen, is sometimes most vexatious in its results. In one case which comes to our recollection, the costs of a suit to recover some L50 or L60 were run up by a law arbitrator to L1700.

Arbitration, as commonly practised, being thus far from simple or satisfactory, a new method is suggested. In every town, let a number of intelligent and well-meaning persons form themselves into an association, to be called an "Arbitration Society." The society to appoint certain of its members, in whom they have confidence, to act as arbitrators or judges on all cases brought before them. All the members to agree to bring, if possible, the cases in which they are concerned for settlement before these arbitrators, and to exert themselves to persuade others to do the same. Every case brought before the arbitrators to be conducted without the intervention of lawyers, or written pleadings; the whole process to be managed by personal appearance of parties, and to be settled at not more than two or three hearings, or in the period of one week; if not settled in that time, the obligation to arbitrate to be null and void.

Such is a slight sketch of the proposed plan for diminishing the number of litigations. It, of course, can never apply to the more intricate order of cases in which legal points are involved, but only to the ordinary class of actions in equity, such as disputed accounts, in which both parties agree to submit to the decision of men who can derive no profit from the protracted consideration of their claims. In these respects, the

scheme seems more calculated to abolish the practice of referring to law arbitrators, than that of resorting to the ordinary tribunals of the country; but if it even in some measure accomplish this end, it will not fail to be of considerable use. We wait with some anxiety to hear how it has succeeded in the town in which we are told it is now in the course of trial. Whether it succeed or not, we think the attempt to establish such an extra-judicial tribunal in England, is a curious evidence of the growing distaste for litigation, and, all things considered, can excite no degree of surprise.

A FEW WEEKS ON THE CONTINENT.

BRUNNENS OF NASSAU CONCLUDED—RETURN TO THE LOW COUNTRY.

At an early hour of the morning, as I have said, we rose to explore the village of Langen-Schwalbach, and the localities of its far-famed brunnens. The whole are situated in three valleys radiating from a centre, and environed with the usual round-topped hills of Nassau. The village occupies one of the valleys, and has all the appearance of considerable antiquity, having been originally built contiguous to a mineral spring, which is now to be seen on one side of its long straggling street.

The valley which enjoys the largest share of celebrity for its water, is that radiating in an easterly direction, and down the side of which we enter from Wiesbaden. Here are the two principal springs—the Pauline and Weinbrunnen. The Pauline, which is of latest discovery, is farthest up the valley, and occupies really a charming spot for the morning perambulations of water-drinkers. Both this and the other springs rise in circular orifices, as from a well, and the water is dipped in glasses by female attendants, which is a much more satisfactory plan than that of pumping the water from a source unseen by the drinker. We have thus no fear that the water is a compound artificially manufactured in the cellar of the pump-room, but are assured of its rising from the great laboratory of nature below. On descending into the small enclosure in the centre of which the Pauline rises, we perceive that the water is projected upwards with considerable force. On being lifted in a glass, small air-bells are observed rising to the surface, as if the liquid possessed a certain degree of effervescence. I shall never forget the first taste which I had of this very remarkable mineral spring. It most resembled sharp small-beer, but was accompanied with a ferruginous property, which made the tongue feel as if it had been scoured with alum. I cannot, however, say that there was any thing disagreeable in either the smell or flavour of the water. As a drink, it was infinitely more palatable than any mineral water I had ever before tasted, and I should think that to habitual beer-bibbers it must form quite an agreeable tap.

The Weinbrunnen (or wine-spring), at the foot of the vale near the hotels, bath-house, bazaar, and other structures, and also the Stahlbrunnen (or steel-spring), situated in the western valley, did not seem to my taste greatly different from each other; in fact, all the three springs have a similar sharp small-beer flavour, though they may differ in strength. With respect to the precise nature of the waters, Dr Granville observes, that "the quantity of carbonic acid gas is greater in the Pauline than in either the Wein or the Stahlbrunnen. The relative proportion in a pint of the latter is twenty-three cubic inches, that of the Pauline being twenty-nine. There is steel or carbonate of lime in all the springs. The Pauline contains the least of it." All are serviceable in cases requiring chalybeates; but I apprehend that here, as at other watering-places, much of the cure in valetudinarians is ascribable to early rising, and almost constant open-air exercise. The walks along the hill-sides, and towards the inner winding extremity of the valley of the Pauline, are exceedingly delightful, every thing being done that taste can suggest to provide for the comfort of the visitors. So highly are the waters appreciated for their medical quality, that 500,000 quart bottles are filled and exported annually.

The old spring in the village is sulphureous, with little iron in its composition, and is now deserted for its more modern competitors. When we paid it a visit, it had no attendant to sell its waters, and we only knew its taste by lifting a little in our hand. The author of the "Bubbles from the Brunnens of Nassau" observes of this ancient spring, "Such a suffocating gas arises from it, that, as at the Grotto del Cane at Naples, one single inhalation would be nearly sufficient to deprive a person of his senses. Besides being strongly impregnated with this gas, it has such an unearthly taste, that one almost fancies it must flow direct from the cellar of his Satanic majesty." This is doubtless a quizzically overdrawn statement. Excepting the usual sulphureous taste of such springs, there was nothing offensive in the water; and as for the suffocating smell, we were not sensible of any thing of that kind worthy of notice.

Langen-Schwalbach is visited almost exclusively by Germans. Few English remain to take the benefit of the waters, the place being too quiet and retired for those classes of our countrymen who go abroad on the plea of unsound health. Among all the English whom one meets with in travelling in this part of the world, there is a restless desire to go farther: they push on from place to place, staying a short time here and a short time there, as if in quest of something better, and will not be contented with simply

abiding in such a place of cool retirement as Langen-Schwalbach. Influenced by this propensity to push on, they in the same manner hurry through the finest portion of the Rhine scenery, still looking for scenes that are more beautiful, and in many instances return either in a dissatisfied humour, or with a mere dreamy recollection of having been whirled over a certain extent of ground, containing some hills, old castles, a river, and a few strangely built towns and villages. We found that there had been at Langen-Schwalbach, during the season, four thousand visitors, a number very much greater than that specified by Sir Francis Head; and although many had gone, still the hotels were crowded. The Alée Sal, at which we resided, affords accommodation for a large number of strangers, and daily exhibits a table-d'hôte, at which about two hundred individuals sit down to dinner. Notwithstanding that few of our countrymen come to reside in this house of entertainment, we found that English was spoken here by one or two of the waiters, as it was indeed in every hotel in the whole course of our route, with only two exceptions.

In the course of the day after our arrival, having made ourselves acquainted with all worth noticing, we proceeded onwards to Ems, the last of the watering-places on our route. The road winds upward from the old village over the rounded top of one of the hills, and hence, for several miles, offers little to the view but brown heathy tracts of mountain scenery, here and there relieved by an old blue slaty village, the place of residence of a poor class of small proprietors and farmers. After ascending and descending several times, a turn of the road brings us in front of a deep and picturesque valley, from the lower extremity of which rises a woody conical mount, ornamented at top with the old Castle of Nassau. Turning to the right, on approaching this ancient ruin, the valley opens on the larger vale of the Lahn, with the small town of Nassau on the right bank of the river, opposite the castle. Standing thus at a connecting point between two valleys, and rising to the height of about three hundred feet, the castle mount is a most conspicuous object in different points of view, and assists in forming one of the most romantic and beautiful pieces of scenery in the country. From a suburb below the shadow of the woody height, we reach the town of Nassau by a handsome and modern chain bridge, which is capable of allowing two carts to pass in the breadth, besides foot passengers, and measures ninety paces in length, that being the breadth of the Lahn at the spot. Three or four centuries ago, Nassau was a place of residence for the baronial family from whom the present duke has sprung, but it is now deserted by the aristocratic splendour of these merry times, and is the picture of poverty and decay; like the little old towns on the Rhine, it is little else than a collection of habitations for agriculturists and vine-gardeners.

The road, after passing through Nassau, goes for some distance down the right bank of the Lahn, with an almost precipitous vine-clad hill above, and discloses some admirable points of view for the pencil of the draughtsman. Leaving the river, we ascend another of the huge round-backed hills, and again descending, are shortly brought back to the Lahn, and have before us, on its right bank, the very ancient town of Ems. Nowhere is there so strangely situated a town. It occupies a long stripe of ground between the side of the river and a rocky hill, which in some places is a perfectly perpendicular cliff, impending over the roofs of the houses. There is in general room for only one row of dwellings, with the road in front of them; but to afford space for promenading, there is a bridge of boats across the Lahn, leading to some beautiful woody banks opposite. Ems was known by the Romans for its mineral waters, and received from them the name of Embasis, or the Washing-Tub, which is the origin of the present appellation. It possesses several springs, both for drinking and bathing, and of different degrees of heat. Nature is so bountiful in the supplies, that 12,400 cubic feet of water issue from the ground every twenty-four hours; a quantity, however, much less than is daily expelled at Wiesbaden. Some of the springs rise in the bed of the river, and their produce is consequently lost; while of the remainder, the principal have been covered over by houses or hotels, in whose lower parts the baths are situated. The chief establishment is an old residence of the Duke of Nassau at the centre of the town. We visited some of the bathing-rooms, which were dismal-looking dungeons, steaming with vapour, and any thing but calculated to soothe the feelings of valetudinarians. Numberless cures are said to have been performed by the use of the waters, particularly among the female sex, for whose complaints they are said to be adapted; but if Dr Granville's opinion is to be taken, there is no small degree of danger in their application. "The nervous system (says he) is the first and the most seriously disturbed by these waters; and I attribute the fact in a great measure, first, to the large quantities of carbonate of soda taken daily into the system along with them; and, secondly, to the additional bad influence which the air of a narrow confined valley, and the contiguity of the lofty hilly ranges of siliceous grauwacke slate, produce in individuals already prone to nervous agitation, or irritability. Hence Ems can never suit an hypochondriac, no matter from what functional disorder his unhappy state may arise. It never can suit persons labouring under any modification whatever of disease of the heart, whether structural or merely functional. They are disturbing waters in the way of alternatives,

to a degree which is scarcely producible by means of ordinary medicines, and which, although very beneficial to some, is injurious to many, and requires under any circumstances great circumspection in the lengthened use of them. So great is the disturbance produced in the system while the waters are drunk, that I am acquainted with very few patients who have got well of their complaints during the treatment, or before they came away from Ems. Of the rest who recovered, long after they had left the spa, the major part had judiciously enough been prevailed upon to go and finish their cure at some other place—generally a cold spa."

In our ramble through Ems, we were attracted by the appearance of a slip of public garden, in which was a handsome pavilion, close by the river; and, entering the edifice, the usual gambling apparatus presented itself, with its crowd of attendants. To a native of a country in which the only attempt ever made to establish a gaming-house was at once put down by the public authorities, the frequency of this spectacle at the German watering-places becomes very distressing. It appears to him as if the opportunity of unlimited gambling were even a greater attraction to the mass of the visitors, than the waters. Instead of interfering to break up the gaming-houses, the public authorities frequently profit by their establishment. In the gambling-rooms at Ems, and other places in Nassau, we observed that regulations for the games were hung up on the walls, by order of the duke, which, at least, proves that that personage sanctions and approves of the odious practice. We are told, in a native description of Nassau, that, "by an edict of the government, all the subjects of the duke are forbid to play, and any individual holding an office under him, who is detected in playing, loses his situation." I should, from what came under my own observation, doubt that such a law is in existence; but allowing it to be as stated, what must we think of the conscientiousness of a government which, while protecting its own subjects, allows strangers to be plundered with impunity?

We must now quit not only Ems and the other brunnens of Nassau, but also the upper Rhenish country in which they are situated. A drive of little more than an hour, over a tract of hilly ground, brought us once more to the right bank of the Rhine at Elrenbreitstein, and next morning a steamer from the opposite quay at Coblenz, carried us down the river on our way homeward. Having already described both banks of the Rhine in ascending, it will not be expected that I should here recur to the subject, further than to give some little account of Bonn, a town at which we stopped for a few hours in our descent.

Bonn is situated on the left bank of the Rhine, about twenty miles above Cologne, and at present enjoys the reputation of being the best seat of education in Prussia. The town, like Cologne and Coblenz, is surrounded with walls, and is consequently confined and wretched in its internal organisation. The streets are narrow and badly paved, and most offensive from the want of drains. So far, therefore, as physical comfort and health are concerned, the learning for which the town has obtained some celebrity, has been of no service. On visiting Professor Schlegel, I found him living in a quarter infinitely more vile in aspect than that of the lowest parts of London or Edinburgh, though, such is the influence of habit, the desagremens of the locality do not seem to affect him.

Bonn is a town of considerable antiquity, having, like Cologne, been originally a settlement of the Romans, and in later times a seat of some important religious bodies. The most remarkable of its edifices is the Dom Kirk or Cathedral, which is in the Byzantine style of architecture, and was built some centuries ago on the site of a church erected by the Empress Helena, mother of Constantine the Great, in the year 316. In the neighbourhood of the cathedral, and verging on the southern environs of the town, stands a fine large edifice in the Grecian style of architecture, now used as one of the principal university buildings. The other chief edifice, which is used for a certain department in the course of instruction, is the ancient chateau of Poppelsdorf, situated at the extremity of an avenue of trees leading from this quarter of the town. The university of Bonn was established by the present king of Prussia in 1818, and has been placed on the most liberal footing as respects the nature of its education, while the discipline maintained among the students is allowed to be more correct than has usually been the case at other German universities. The Prussian government has at least, with its well-known regard to the instruction of youth, taken care to appoint only men of first-rate abilities to the different professorships. The faculties include theology, according to the Roman Catholic and Reformed churches, jurisprudence, medicine, literature, and physics—the latter comprehending zoology, botany, mineralogy, and chemistry. The botanical garden, which is situated near the chateau, is upon a most extensive scale, and kept in the most beautiful order. The number of students lately enrolled in the university books for one year, was nine hundred and eighty-eight, which included one hundred and ninety-two youths from countries foreign to Prussia.

In the after part of the day we went on board a steamer descending the river, and were in a short time landed on the quay of Cologne. Next day we departed from this ancient city, and pursued a westerly direction towards Aix-la-Chapelle. The road is quite uninteresting, being mostly flat, with some slight rises; it is, however, rich and arable, and

only requires capital and skill to make it produce abundant crops. Nothing that I had ever seen before, except in Ireland, equalled the apparent poverty and wretchedness of the population. The villages in which they cluster are built of mud and wattle, and have no symptoms of thriving. Nowhere as far as the eye can reach is there a single gentleman's house to be seen; the whole country seems delivered up to a race of toil-worn peasantry, from whom all hope of bettering their condition appears to be shut out. Riding through this border country of Prussia and Belgium, we first reach Berghem, a small old town with decayed walls, and next Juliers, a town surrounded with regular and strong fortifications. Thence a drive of two hours along a badly paved road brings us to Aix-la-Chapelle, situated in a valley in the midst of a district more beautiful and better enclosed than that through which we have passed.

Aix-la-Chapelle, or Aachen, as it is called by the Germans, is a town of great antiquity: its origin, indeed, is probably coeval with the first peopling of the country, for it appears to have been occasioned by certain medicinal springs which exist upon the spot. The town is celebrated as the scene of both the birth and death of the Emperor Charlemagne (742-814). In the present day, it consists of several respectable, but many more dirty and confined streets, with a population of about 38,000. Necessity, as well as inclination, led us, shortly after our arrival, to visit the Rath-Haus, or Hotel de Ville. Being the last of the towns in the Prussian league which we had to pass through, it was necessary to have our passports inspected, and stamped with the licence for departure from the kingdom. To the Hotel de Ville, therefore, which is now the police-office of the town, we proceeded to have this troublesome ceremonial performed, for here personal attendance is imperative. The edifice is a large handsome building, of stone, with elegant exterior flights of steps, and stands in a high part of the town, at one side of the open market-place. We feel, in looking upon this imposing structure, that we behold a palace in a state of degradation and neglect. The roof and walls of the spacious vestibules and corridors have been painted with historical figures and scenes, but smoke and dirt have rendered them dim and undistinguishable; a lofty room, which has been similarly embellished, is divided in two by a paltry wooden partition; and the whole interior has an air of squalid misery. Yet this edifice has been a great place in its day. In its principal saloon, important assemblages of political characters have occasionally taken place for the conclusion of great treaties; the last took place in 1818, when the emperors of Austria and Russia, with ambassadors from the Prince Regent of England and Louis XVIII., met to decide upon the evacuation of France by the troops of the allied powers.

The Hotel de Ville is said to stand on the spot where Charlemagne was born; and to preserve the recollection of that personage, a splendid fountain has been erected in the market-place in front: it is composed of a large bronze basin for receiving the water, and from the centre of the basin rises a pedestal, on which a statue of Charlemagne, also in bronze, is erected. The whole fabric was erected so long ago as 1353 (when the neighbouring Hotel de Ville was finished), and it has been kept carefully in repair since that time.

Proceeding from the open market-place down a narrow lane lined with tall dingy houses, we arrive at a low spot of ground whereon stands the ancient Cathedral—the chapel from which the town has received a portion of its name. It is impossible to make out either style or date from the appearance of the structure. It is a mass of ill-assorted parts, Gothic, Saxon, Byzantine, old and new all stuck in a heap. Such at least is the exterior. The interior of the building is chiefly remarkable for an octagonal nave with tall rounded arches, which forms the most ancient of the various parts of the motley structure, having been built by Charlemagne in 796 as a chapel for his place of sepulture, on the model of the Holy Sepulchre at Jerusalem. It was afterwards partially destroyed by the Normans, but was restored by the Emperor Otho III. about the year 1000; its age is, therefore, at least between eight and nine hundred years. Charlemagne was entombed, according to his request, in a vault below the centre of the dome, but here his remains do not repose till the present day.

Had this monarch contented himself with going down into the dust like the rest of his fellow-creatures, he would have stood a fair chance of being left to dissolve into the original elements of humanity. Unfortunately, however, for his posthumous repose, he chose to be buried in all the magnificence of his robes of state, and sitting upon a throne, as if still, though in his dreary dungeon tomb, ruling the destinies of half the world. It was not in the nature of things that his majesty should be allowed to sit for ever in this condition of costly splendour. Otho III., emperor of Germany, visited the spot, probably at the time he ordered the restoration of the edifice, and causing the tomb to be opened, there found the skeleton of Charlemagne sitting on the throne on which it had been placed at his death in 814. A lapse of nearly two hundred years had not materially disfigured the gay ornaments in which the dead monarch was invested. On the fleshless skull there was stuck a crown which he had worn during life; a sceptre was fastened in his right hand; a jewelled mantle of state was thrown over his shoulders; a copy of the gospels was

carefully placed upon his knees; a sword was buckled to his side; and to his girdle was hung the pilgrim's pouch which he had borne when alive as a token of Christian piety. Otho forthwith removed these valuable insignia of royalty, to be used at the coronations of the emperors of Germany. The tomb was again shut up after this spoliation, and it remained closed till the year 1165, when Frederick Barbarossa, moved by curiosity and piety, ordered it to be opened in presence of the bishops of Liège and Cologne, and caused the body to be removed, and placed in a splendid sarcophagus prepared for the purpose; at the same time the throne, or all that remained of it, consisting of a chair of white marble, was brought up to the church, where it is now preserved with much care, and exhibited to strangers. Although the body of Charlemagne was thus, to all appearance, stowed safely away, it was destined to be again handled and disturbed. At what period it was taken from the sarcophagus, is not told by any authority, but it is certainly gone, as the empty sarcophagus testifies. In all probability it has been dispersed in the form of relics, a leg in one place, an arm in another, and so on with all the other members. I understand that the only fragments remaining in the reliquary of the cathedral, are the skull and an arm bone, but during my somewhat hurried visit, I had not an opportunity of seeing them.

At a short distance south from the cathedral, in the lower part of the town, we find the chief street of fashionable parade in Aix. Here are situated the principal mineral springs, and the rooms and arcades which cover them. The waters are sulphureous, warm, and nauseous, both to the sense of smell and taste. One of the hottest of the springs is so abundant that it cannot all be used for drinking and bathing, and is therefore allowed to escape for the benefit of the lower class of inhabitants, who wash all their clothes with it; and as it is alkaline, they have no need for soap. Adjoining the water-drinking and bath rooms, stand some magnificent hotels and gambling-houses. One of the latter, called the New Redoute, ranks as the most splendid and profligate of all the establishments of the kind on the continent. Gamblers flock hither from France, England, and most other countries in Europe, and the sums lost and won at the tables exceed all calculation. Aix-la-Chapelle is the only place within the Prussian dominions in which gambling is licensed or allowed. A number of years ago, the public authorities, shocked with the misery and depravity arising from the practice, endeavoured to prevent it from being carried on within the town. The consequence was, that a small village, named Bocette, sprang up in the environs, to which all the inveterate gamblers, with their tables, resorted; and as Bocette has also hot springs, visitors began to prefer it to Aix. After a time, the town authorities relaxed, and the present elegant gambling-houses have been erected, and placed under some kind of regulations, one of which is, that a portion of all winnings, by the keepers of the tables, shall be devoted to the embellishment of the town.

EDUCATION IN INDIA.

THE widest of all the fields of human improvement now disclosing themselves to the consideration of thoughtful men, is that which is afforded by the British possessions in India. In the extensive regions of Hindoostan, over which the East India Company, conjointly with our government, exercise a control, there are at the very lowest computation a hundred millions of human beings. These are of various races, speak different languages, and have attained different degrees of intelligence. They are also of different religions, principally Mahomedan and Hindu; but, practically, the religious belief in either way is little else than a mass of superstition and absurdity. To improve this numerous and interesting family of mankind, some benevolent efforts have been made within the last twenty or thirty years; unfortunately, however, for want of a just knowledge of the very critical nature of the habits of thought, and deeply rooted prejudices of the natives, comparatively little good has been effected. One great error has consisted in an attempt—well meant, no doubt—to proselytise to Christianity, before opening the mind by instruction in simple secular knowledge. It is time that this profound mistake should be corrected. The bulk of the lower orders are as ignorant as children, while the higher castes are pridefully encased in the mysteries of their own faith, and have, generally speaking, resisted all that has been done to bring them within the pale of the gospel.

It may be known to most of our readers that the melioration of the condition of the native tribes of India was an object which Lord William Bentinck had earnestly at heart, during his government of that country, and that he actually carried into execution a law to prevent widows from devoting themselves to the flames on the funeral pile of their deceased husbands. We have now to make generally known, perhaps for the first time in this country, a great educational project, which occurred during his lordship's government. This was prefaced by the collection of information throughout the provinces of Bengal and

Behar regarding the state of popular education. The gentleman entrusted by the governor-general and his council with making the required investigations, was Mr William Adam, who commenced operations in January 1835. From this period Mr Adam was engaged in prosecuting his very laborious duties till June 1838, when he laid before government his third and concluding Report, which was forthwith ordered to be printed at the Bengal Military Orphan Press in Calcutta. By an accidental circumstance, a copy of this work now lies before us, and we shall endeavour to gather and arrange a few important particulars from its pages.

Travelling from district to district, and assisted by a suite of intelligent sub-investigators acquainted with the localities, Mr Adam collected a large body of minute statistical facts regarding the manners and the intellectual state of the people. The first part of his evidence consists of an account of the schools of native origin and growth. It appears that India is very far from being destitute of schools. In all the towns there are a number of schools of different kinds, suited for the various races and castes, from the lowest to the highest, and in most villages there are schools of a humbler order for the rural population, who speak only the vernacular tongue. Let us take, as an example, Mr Adam's account of the state of instruction in the city and district of Moorsheadabad. "In 20 thanas [police subdivisions] of this city and district there are 67 vernacular schools, of which 62 are Bengali and 5 Hindi. There are eleven villages, mohallas, or bazars, containing each two vernacular schools, or twenty-two in all, of which twenty are Bengali, and two Hindi. The remaining forty-five are found each in a different village or mohallah. The number of teachers is the same as the number of schools," and they belong to eleven different Hindu castes. "Besides these, there is one Bengali school taught by a Mussulman. To teach reading, writing, and accounts, is considered the proper duty of the Kayastha, or writer-caste; and a Brahmin, a Vaidya, or a Kshatriya, is supposed to degrade himself by engaging in such an occupation, while, on the other hand, any of the castes inferior to the Kayastha acquire by the same means increased respect. Persons of good caste do not hesitate to send their children to schools conducted by teachers of an inferior caste, and even of a different religion. Of these teachers there are five who give their instructions gratuitously, of whom two are family priests, one is a weaver, and another a retail-dealer. One of the priests, although he receives no fixed payment either in the form of monthly wages from the parents, or in the form of fees for each scholar, accepts at the period of the great annual festival, or Durga Puja, a present of uncooked rice, pulse, salt, oil, vegetables, wood, cooking utensils, &c.; and the weaver, though he does not exact any fees from his scholars, receives what they offer him. His school was opened only about a month before I visited the district, and he had received within that time ten pice from the different scholars to aid him in bearing incidental expenses. By day he works as a weaver for his livelihood, and teaches in the evening. There are also many cases in which paid teachers instruct a greater or less number of their scholars gratuitously. It gives me great pleasure to mention these instances of unostentatious benevolence in the humblest ranks of native society. They prove both the merit attached to the communication of knowledge, and the readiness to receive instruction on the part of many who can offer no compensation for it. A people amongst whom such dispositions are found, presents both materials to work upon, and good instruments to work with."

The majority of teachers, as we are told, receive each from four to five rupees (9s. to 10s. 6d.) per month as their entire remuneration, and the school-houses are sometimes on the most primitive scale. "In a majority of instances there is no school-house, in which case the house of the teacher, a family or village temple, an outhouse of one of the parents, the hut assigned for the entertainment of travellers, the corner of a shop, the portico of a mosque, or the shade of a tree, is employed for the purpose. Regarding the school-houses of the district of Beerbhoom, I shall transcribe only a few of my notes. In one village the school-house was built by the teacher at a cost of money of Rs. 1-4 [we suppose something like half-a-crown] with the aid of his pupils, who brought the materials from the jungle. In another, the school-house was built by the scholars at a cost of Rs. 1-8, in addition to their own labour. The house is thatched, and the walls consist of branches and leaves of the palm and sal trees interlaced. In a third, the scholars assembled in the village place of worship, and they were engaged in building a school-house with thatched roof, beams, and rafters, and mud walls, which was expected to cost in all about ten rupees, besides their labour. Several school-houses are noted as having been built by subscription among the parents. The temples consecrated to Yama, the Judge of the departed—the Minoos of Hinduism—I have found frequently used as school-houses in this district, in consequence of the extent to which the worship of that deity prevails."

With respect to the instruction communicated in these rude seminaries, it is, as may be supposed, very small. To acquire the art of keeping commercial and agricultural accounts, is the principal object. Speaking of what is taught in Moorsheadabad, Mr Adam observes: "In the only Hindi school in which vernacular

cular works are used, those works are the *Dan Lila*, and *Dadhil Lila*, both describing the amusements of Krishna, the former his boating pleasures on the Jamna, in the neighbourhood of Brindavan, and the latter the tricks he played the milkmen in that place with his youthful companions. In only one Bengali school, the *Guru Bandana* was found in use, a doggerel composition containing an expression of the respect and devotion due from the scholar to his teacher. The arithmetical rules of *Subhankar* were employed in thirty-two schools. The *Guru Dakshina*, another doggerel composition, which is sung by the elder boys of a school from house to house to elicit donations for their master, was taught in three schools. In addition to these vernacular works, a small portion of [the learned language of India] the Sanscrit vocabulary of *Amara Singh* was found to be in use in one Bengali school; in another, a work called *Sabda Sabanta*, containing the rules of Sanscrit orthography, the permutations of letters in combination, and examples of the declension of nouns; and in 14 schools, the Sanscrit verses of *Chanakya*, containing the praises of learning and precepts of morality, were read or committed to memory." He afterwards says—"The remaining works used in the common schools rank low as compositions, and consist for the most part of the praises and exploits of the gods recognised by the established religion of the country."

In the various common schools the languages used are the vernacular tongues of the different races, being chiefly Bengali in the Bengal, and Hindi in the Behar districts. In Burdwan, Bengali, and in South Behar, Hindi, are exclusively used; but in Mednapore, Uriya is largely employed as well as Bengali; in the city of Moorshedabad, and in the district of Beerbhoom, Hindi is used to a very limited extent in addition to Bengali; and in some parts of Tirhoot, Trilutiya, in addition to Hindi, prevails as the language of conversation, of verbal instruction, and of correspondence, but is never employed as the language of literary composition."

Next above the vernacular schools, are those in which the Sanscrit language is employed for the purpose of communicating a knowledge of literature, law, philosophy, and the Hindu religion. In twenty thanas of the city and district of Moorshedabad, there are 24 Sanscrit schools, all taught by Brahmins—of which 13 are of the sect Varendra, 8 Rarhi, and 3 Vaidika. The teachers of this class of schools are partly paid by small native endowments and partly by fees, their remuneration being greater than is received by teachers in the vernacular seminaries. There is not any mutual connection or dependence between vernacular and Sanscrit schools. "The former are not considered preparatory to the other, nor do the latter profess to complete the course of study which has been begun elsewhere. They are two separate classes of institutions, appropriate to distinct classes of society—the one for the trading and agricultural, and the other for the religious and learned classes. They are so unconnected that the instruction in Bengali and Hindi reading and writing, which is necessary at the commencement of a course of Sanscrit study, is seldom acquired in the vernacular schools, but generally under the domestic roof; and unless under peculiar circumstances, it is not extended to accounts, which are deemed the ultimate object of vernacular school instruction."

The class of institutions next in importance are the schools in which the Persian and Arabic languages, and the learning they contain, are taught. In 20 thanas of the city and district of Moorshedabad, there are 17 Persian and 2 Arabic schools, the teachers being with one exception Mussulmans. It is gratifying to find that among the Mahomedan teachers of this set of institutions, much generosity is displayed in the free communication of knowledge such as it is. In the district of Burdwan, we are told that "twenty-two teachers instruct gratuitously, and of that number six also support and clothe the whole or part of their scholars. I have not found any instance in which Hindu students receive from a Mussulman teacher or patron any thing beyond gratuitous instruction. Thus, in one instance, a Maulavi gratuitously instructs seven Hindu scholars; but in addition to gratuitous instruction, he gives also food and clothing to eleven Mussulman students; in another, a Maulavi gratuitously instructs two Hindu and six Mussulman students, and he gives also food and clothing to five other Mussulman students."

Mr Adam found the following works in use in the Persian schools (we omit the hard original titles)—an elementary work, a vocabulary, dialogues, a grammar, forms of correspondence, modes of address, the poems of Hilali and Kalim, an account of one of the kings of the Deccan, tales, names and attributes of God, the doctrines of Islam, and a work on medicine. In the Arabic schools, he found in use treatises on inflection, syntax, logic, rhetoric, natural philosophy, the elements of Euclid, on astronomy, on the law of inheritance, and on the doctrines of Islam.

There is also a class of seminaries, which may not inaptly be termed family schools, being formed simply of the children belonging to particular families of the more affluent order. The number of families in the city of Moorshedabad in which domestic instruction is given, is 216, of which 147 are Hindu and 69 are Mussulman families. The number of children instructed in each is only two or three.

The number of schools in which English is taught is very limited, and they are chiefly conducted by

missionaries, who can spare little time to instruct their pupils. It is a circumstance not a little extraordinary, that in most districts there are few or no schools supported or encouraged by the numerous and frequently wealthy European residents. "Every Englishman (says Mr Adam) lives and toils to amass a fortune: no passion is so strong or so pervading. The people, in the meantime, whose labour gives revenue to the state and wealth to the individual, are degraded by ignorance and poverty, and the obligation to instruct and elevate them is sometimes wholly denied, and in all cases is feebly felt and acknowledged."

Having detailed the special facts which he gathered throughout the districts he visited, Mr Adam proceeds to sum up the result of his inquiries. The amount of population of which an educational survey was made, so as to afford the basis of a correct inference, was 7,789,152; and the estimated additional population to which the inference may be extended, is 27,671,250, together amounting to 35,460,402, being that portion of the Indian population which has lived longest under British rule, and which should be prepared or preparing to appreciate or enjoy its highest privileges. It is estimated on the fairest evidence, that of the adult portion of this population, in the district where education is most abundant, only 9 per cent. have received instruction of any kind, even of the most insignificant description; while in a district less favourably situated, the proportion of the instructed adult population is shown to be less than 2½ per cent. In the same districts, of the juvenile population, that is, of the population between 5 and 14, in the one only 16 per cent. are receiving instruction, and in the other exactly 2½ per cent., leaving the rest wholly uninstructed. What may be the scope for a system of rational instruction in the other portions of our Indian empire, may be partly guessed from these results, though into this question Mr Adam prudently does not enter.

From all that has ever been told in England regarding the population of India, it has been made to appear that they were in general studiously opposed to instruction, and even to social intercourse with Europeans. There has been in this either some misapprehension or exaggeration. Mr Adam now discloses the fact—and this is the most valuable fact in his book—that the general population of Bengal and Behar, of high and low caste, are zealously anxious for instruction: they cry for it, they would receive it as the greatest of earthly blessings. Speaking of the tone of feeling of the lower castes on this subject, the author remarks—"They are gaining ground, and are almost imperceptibly acquiring a sense of the value of even the humblest instruction which is within their reach, but from which, by the customs of society, they were formerly almost debarred. The time is not distant when it would have been considered contrary to all the maxims of Hindu civilisation, that individuals of the *Malo*, *Chandal*, *Kahar*, *Jalia*, *Laharia*, *Bagdhi*, *Dhoba*, and *Muchi* castes, should learn to read, write, and keep accounts; and if some aged and venerable Brahmin who has passed his whole life removed from European contamination, were told that these low castes are now raising their aspirations so high, he would deplore it as one of the many proofs of the gross and increasing degeneracy of the age. The encroachment of these castes on the outskirts of learning is a spontaneous movement in native society, the effect of a strong foreign rule unshackled by native usages and prejudices, and protecting all in the enjoyment of equal rights."

It further appears from these valuable researches, that the native learned men of India, the class of influential literati among the higher castes, who have been hitherto wasting their energies on absurd and vicious fictions, have professed to Mr Adam "their readiness to engage in any sort of literary composition that would obtain the patronage of government. Instead of regarding them as indolent, intractable, or bigoted in matters not connected with religion, I have often been surprised at the facility with which minds under the influence of habits of thought so different from my own, have received and appreciated the ideas which I have suggested. Nor is it authors only who might be employed in promoting the cause of public instruction: it is probable that the whole body of the learned, both teachers and students, might be made to lend their willing aid towards the same object."

Our quotations have run to such a length that we have left ourselves little room to notice the arrangements proposed by Mr Adam, in conformity with instructions given to him, for the improvement and extension of public instruction in Bengal and Behar. The leading feature of his plan is, that any thing to be done must be based on the present varied organisation of native schools; in other words, aiding the schools already in existence, and establishing new schools only where there is a total destitution with respect to public instruction. The whole race of native schoolmasters, ignorant as many of them are, must be conciliated. And no attempt whatsoever must be made upon the settled religious prejudices of any class of natives. Upon the supposition that the existing external arrangements are not to be altered, it is conceived that little trouble or expense would be incurred in the establishment of means for improving and supervising. Exclusive of the salary of a general examiner, small payments to teachers, and rewards to scholars, the principal expense would be incurred for school-books. These treatises, ac-

cording to Mr Adam, should form a series of four in number, and be printed in the Bengali and Hindi languages. The first to include all that is at present taught in scattered and disjointed portions in the vernacular schools; and to be a text-book for instruction in writing on the ground, on the palm leaf, and on paper; also to be a manual for accounts. The second book to explain the most important arts of life that contribute to comfort, improvement, and civilisation, and to give elementary views of the sciences which have produced and helped to perfect them; trade and the subdivisions of manual labour; manufactures and the use of machinery; and above all, the best modes of agriculture. The third book to be explanatory of the moral and legal relations, obligations, and rights, whether personal, domestic, civil, or religious, of men living in a state of society, and under the existing government. And the fourth book to be of a superior order on physical geography, history, and astronomy. It is confidently believed by Mr Adam, and all who have personally investigated the subject, that the universal inculcation of secular knowledge of the description mentioned in these books, would, at no distant period, put quite a new face on the intellectual condition of India. The minds of the natives being awakened and elevated, they would be prepared to throw off the mass of superstition which now presses upon them, and be favourably disposed to listen to the prelections of those missionaries of Christianity who would seek to engage their attention. However this view of the case may be received in Britain, it is satisfactory to know that it has met with the approbation of all classes of Christians in India.

We have now presented a superficial sketch of what is proposed to be done, in order to carry out this great project of human improvement. All that remains to be desired is the cordial co-operation and assistance of the British government. There is, it seems, no lack of funds in India to prosecute the good work, provided they are rightly applied; at least, not much more is wanting. May we trust that not only the executive government, but the people at large, will promptly exert themselves in a cause of such immense importance. In the language of Lord Moira, "To be the source of blessings to the immense population of India, is an ambition worthy of our country. The field is noble. May we till it worthily!"

VOLCANIC ISLAND IN THE MEDITERRANEAN.

THE heaving up of volcanic matter from the bottom of the sea to such a height above the surface of the water as to form an island which may be safely trodden, is a rare and interesting occurrence. That such things frequently happened at a former, and probably an early period of the earth's history, is quite evident from the great number of islands which are found to be of volcanic origin; but an event of this description taking place in our own times, is calculated to fix attention, as much from its novelty as from its extraordinary nature. In July 1831, an island was thrown up between Sicily and Pantellaria, in the following remarkable manner. About the 10th of July, a column of water, like a water-spout, sixty feet in height, and afterwards a cloud of vapour, were observed rising from the sea, at the place where the island afterwards made its appearance. No fire was seen until the 17th, when the master of a London brig was able to distinguish flame; and it is probable that at this period the land began to emerge from the water. On the night of the 18th, flashes of brilliant light, mingled with smoke, were distinctly visible by the light of the moon; and so remarkable were the appearances, as to induce the commander of one of his majesty's ships to steer for the spot, for the purpose of examining them more closely. A large column of smoke was seen towering above the sea to a considerable height, and from the midst of it pillars of lurid fire shot up, and then subsided, the column which was formerly dark gradually becoming white. This alternation of eruption and repose, of white and black, continued during the whole night. On the following morning a small hillock of a dark green colour was seen rising a few feet above the surface of the ocean, but it continued only visible at intervals between the more violent eruptions. The volcano was in a constant state of activity, and appeared to be discharging dust and stones, together with vast quantities of steam. On soundings being taken, no bottom was found till those who made the experiment were within twenty yards of the island. The form of a crater was now clearly discernible. It seemed to be composed of fine cinders and mud of a dark brown colour; and within it was decreed, during the pauses of the eruptions, a mixture of muddy water, steam, and cinders, dashing up and down, and occasionally running over the sides into the sea. All this time showers of hot stones or cinders shot upwards a few yards, and then fell into the gulf whence they were ejected. One of the eye-witnesses observes regarding these eruptions:—"No words can describe their sublime grandeur; their progress was generally as follows:—After the volcano had emitted for some time its usual quantities of white steam, suddenly the whole aperture was filled with an enormous mass of hot cinders and dust, rushing upwards to the height of some hundred feet with a loud roaring noise, then falling into the sea on all sides with a still louder noise, arising in part, perhaps, from the formation of prodigious quantities of steam which instantly took place. This steam was at first of a brown colour, having embodied a great deal of the dust; as it

rose, it gradually recovered its pure white colour, depositing the dust in the shape of a shower of muddy rain. While this was being accomplished, renewed eruptions of hot cinders and dust were quickly succeeding each other; while forked lightning, accompanied by rattling thunder, darted about in all directions within the column, now darkened with dust, and greatly increased in volume, and distorted by sudden gusts and whirl winds. The latter were most frequent on the lee side, where they often made imperfect water-spouts of curious shapes. On one occasion some of the steam reached the boat; it smelt a little of sulphur, and the mud it left became a gritty sparkling dark brown powder when dry. None of the stones or cinders thrown out appeared more than half a foot in diameter, and most of them were much smaller."

At this time the island was from fifty to ninety feet in height, and about three quarters of a mile in circumference. It attracted great attention as soon as the fact became known, and Captain Swinburne was dispatched in a cutter to ascertain the exact position of the island. This commander effected a landing on the 3d of August, hoisted the British ensign, and called it Graham Island. We subjoin a description of the volcano in nearly his own words:—"Seizing a favourable moment, we gave way with our oars. Our distance was rather greater than we could have wished, but we proceeded as quickly as the sea would allow. As we approached, some occasional jets were thrown up, but of little consequence; and a current was discovered running to the westward, and setting us farther to the right than we desired. Within twenty yards of the shore, the water appeared shoal, and the sea broke; but as there was no appearance of surf on the beach, we kept steadily on till the boat struck the ground. The union jack was then planted; such observations were made as the pressure of circumstances and the imminent danger of a fresh eruption every moment would admit of; a bucketful of the materials of which the island seemed chiefly composed was collected; and we re-embarked. The form of the crater is nearly a perfect circle, and complete along its whole circumference, excepting for about two hundred and fifty yards on the south-east side, which are broken and low, not apparently above three feet high. The height of the highest part I supposed by the eye to be about one hundred and eighty feet. The outer diameter is, I think, almost six hundred and forty yards, and the inner about four hundred. The whole circuit of the island I conceive to be from a mile and a quarter to a mile and one third. The fragments brought away are compact and heavy, and the whole surface of the island is dense, and perfectly hard under the feet. No variety of stones were procured, nor any lava; neither did I see any jets or streams of lava while on the island. All the fragments were very hot when collected; and I thought the temperature of the sea close to the shore somewhat higher than farther out, although of this I was not very certain. The latitude of the island is 37 degrees 11 minutes north, the longitude 12 degrees 44 minutes east of Greenwich."

The island went on increasing in size, and, according to some accounts, was in a few days above two hundred feet in height, and three miles in circumference. After attaining this, its maximum magnitude, it appears to have been gradually reduced by the action of the waves, for on the 25th of August it was only two miles round, and on the 3d of September it was no more than three-fifths of a mile in circumference, whilst its greatest height did not exceed one hundred and seven feet. It appears that the volcanic matter, during its ejection, had found a second vent at no great distance from the surface, for in the month of August a great ebullition and agitation of the sea occurred, accompanied by the constant ascension of a column of dense light-coloured steam. By the end of October, not a vestige of the crater remained, and, with the exception of a small heap of sand and scorie, the whole island was nearly on a level with the sea. In short, it at length entirely disappeared, and a dangerous reef, of an oval figure, three-fifths of a mile in extent, now occupies the submarine site of Graham Island. Towards the end of 1833, Captain Swinburne (the same who had planted the British flag upon the island to so little purpose) found, in the centre of the reef, a black rock, about twenty-six fathoms in diameter, and from nine to eleven feet under water. Around this rock were banks of black volcanic stones and loose sand. The rocky mass in the centre is supposed to be solid lava, which ascended in the principal crater; and as at some little distance there was discovered a second shoal, this, with great probability, is conjectured to be the site of the second cone, where the submarine eruption took place in August. It appears then, as Professor Lyell observes, that a hill eight hundred feet or more in height (the depth of water here being six hundred feet) was formed by a submarine volcanic vent, of which the upper part (only about two hundred feet high) emerged above the waters so as to form an island. This cone must have been equal in size to one of the largest of the lateral volcanoes on the flanks of Etna, and about half the height of the mountain Jorullo in Mexico. In the centre is a great column of solid lava, supposed to fill the space by which the gaseous fluids made their escape; and on each side is a stratified mass of scorie and fragmentary lava. The solid nucleus of the reef where the black rock is now found, withstands the movements of the sea; while the loose matter, which remained longest visible, was gradually washed away by it. Subsidiary craters are by no means rare near

the summit of a large cone, and one of these appears to have been formed in the case of Graham Island; a vent, perhaps, connected with the main channel of discharge, which gave passage, in that direction, to elastic fluids, scorie, and melted lava. It is not known whether lava overflowed from either vent, but it is quite possible that melted rocks may have run down the sides of the cone, as often happens on land, and have spread in a broad sheet over the bottom of the sea. There are some remarkable facts connected with this phenomenon. About a fortnight before the eruption was visible, Sir Pulteney Malcolm, in passing over the position of the volcano in his ship, experienced several severe shocks, as if he had struck on a sandbank, and which he attributed to an earthquake. The same shocks were felt on the west coast of Sicily. A circumstance still more worthy of notice is, that there is a tradition at Malta, of a volcano existing on the same spot about the commencement of the last century; and there is extant an old chart of the Mediterranean, which lays down a shoal, with only four fathoms of water on it, and called Larmour's Breakers, within a mile of the same latitude and longitude. Not long before the event took place, a naval officer, in surveying this part of the Mediterranean, found a depth of more than one hundred fathoms' water on the spot, where there is now only about ten feet.

There are other modern instances of the formation of islands by submarine eruptions, as that of Sabrina, in the year 1811, off St Michael's, one of the group of islands called the Azores; but no occurrence of the kind has attracted so much attention, or been so minutely described, as the appearance and disappearance of Graham Island.

THE SCOTTISH WIDOW'S LAMENT.

Afore the Lammass tide
Had dun'd the birken tree,
In a' our water side
Nae wife was blest like me;
A kind gudeman, and twa
Sweet bairns were round me here;
But they're a' ta'en awa
Sin' the fa' o' the year.

Sair trouble cam' our gate,
And made me, when it cam,
A bird without a mate,
A ewe without a lamb.
Our hay was yet to maw,
And our corn was to shear,
When they a' dwined awa
In the fa' o' the year.

I downa look a-field,
For aye I trow I see
The form that was a bield
To my wee bairns and me;
But wind, and weet, and snaw,
They never mair can fear,
Sin' they a' got the ea'
In the fa' o' the year.

Aft on the hill at e'ens
I see him 'mang the ferns,
The lover o' my teens,
The father o' my bairns:
For there his plaid I saw
As gloamin' aye drew near—
But my a's now awa
Sin' the fa' o' the year.

Our bonnie rigs theirsell'
Reca' my wae to mind,
Our pair dumb beasties tell
O' a' that I hae tynd;
For whae our wheat will saw,
And whae our sheep will shear,
Sin' my a' gaed awa
In the fa' o' the year?

My hearth is growing cauld,
And will be cauldier still
And sair, sair in the fauld
Will be the winter's chill;
For peats were yet to ca',
Our sheep they were to smear,
When my a' dwined awa
In the fa' o' the year.

I tittle whiles to spin,
But wee, wee pattenin' feet
Come rinnin' out and in,
And then I just maun greet:
I ken it's fancy a',
And faster rows the tear,
That my a' dwined awa
In the fa' o' the year.

Be kind, O heav'n abune!
To ane sae wae and lane,
And tak' her hamewards sune,
In pity o' her mane;
Lang ere the March winds blaw,
May she, far frae here,
Meet them a' that's awa
Sin' the fa' o' the year.

—*Scotlan newspaper.*

CIRCUMSTANCES WHICH PREVENT THE CORRECT NARRATION OF EVENTS.

Upon scarce any occasion do the witnesses of a perturbed, violent, and agitated scene, agree minutely in narrating what has passed before their eyes; and there often exist circumstances of discrepancy, which, nevertheless, are not considered as affecting the general truth and consistency of the evidence. The truth is, the surprise or shock which the mind receives when an individual witnesses any thing very extraordinary, has an operation in preventing exact circumstantial recollection of what has passed; and the witness, insensibly on his own part, is, in the detail of minute particulars, extremely apt to substitute the suggestions of imagination for those of recollection.—*Genius and Wisdom of Sir Walter Scott.*

TOBACCO-SMOKING.

THE following amusing observations on this practice occur in Mr Matthew's "Emigration Fields," a volume just published:—"Sucking tobacco smoke has become so general, and is indulged in to such excess, as must have a powerful effect upon the destinies of the species. In the north and east of Europe it has increased to such a degree as to act as a considerable population check; and I would desire to introduce it to the notice of our Malthusian philosophers.

The disposition or desire to suck, is no doubt instinctive—a baby reminiscence—and increased in the north of Europe, by the practice of sucking their male children too long. It is pity that this disposition or instinct to suck were not made subservient to some good, and that so much combustion did not extend to the diffusion of heat and light as well as smoke—that it could not be made to warm their cold bosoms to freedom, or enable them to illuminate the 'dark side of nature,' instead of veiling it further by transcendental cloud. Our Eastern neighbours are no doubt indebted to the demon of the 'accursed weed,' set loose by the combustion, for their dreamy philosophy, and their philosophic submission to despotic government. At the present time the weed-demon is the engrossing god of their idolatry. Although tobacco-smoking has not so immediately obvious an effect upon the system as drinking intoxicating liquors, yet from its influence being in more general and constant operation, it has comprehensively, as regards the species, a more powerful impression to disorder the brain mechanism, and derange the flow of the galvanic nervous currents, on which depends the character of our intellectual essence and organic frame. It is impossible to raise the veil from futurity; but notwithstanding the discovery of printing, instead of a progression to a superior nature, a condition of imbecility and degradation is yet in store for man—nay, even a sinking in the scale of being, unless means are taken to subvert the worship of the weed-demon. It is rather surprising that our New Zealand missionaries have allowed themselves to be hoodwinked by the subtle fiend, and made subservient in spreading his abominable rites.

In New South Wales, in the case of convict-slavery (the most pitiful condition of all), where *civilised* man is subjected to the thrall of his fellow-man, and where the feeling of degradation is embittered by the sting of guilt, tobacco-smoking may be necessary. It is even said that great numbers of the convicts would commit suicide, or take to the bush, if they did not receive tobacco to drown conscience and thought. Tobacco-smoking is a means of soothing misery and repressing energy, by inducing a dreamy stupefaction."

ATTENTION TO LITTLE THINGS.

COLONEL MACERONI, among his "Seasonable Hints," in the *Mechanics' Magazine* for January 1836, states that he has had only three pairs of boots for three years, and he thinks he shall not want any more for five years to come. And why? Why, because he has studied out a preserving preparation, suitable to the leather, and applied it in a suitable manner. Now, is there *no* use in that, brother mechanic? A little matter I know it is. Life, and the comforts of it, and the expense of it, and the use of it too, are all made up of little matters—the ocean and the land are made up of little matters—drops of water and particles of dust. I come every way, in a word, to one and the same conclusion. The mechanic, to conduct his business to advantage, or to live like a decent human being, to enjoy health and strength, to do justice to himself or family—to be, in a word, a comfortable, a respectable, or a useful person—must not be an ignorant or an inattentive man; and the more he knows and studies of the right sort of knowledge, the better it will be. This he must do for himself. Other men may do something for him. They have done a great deal, as I have shown. But they have not done, they cannot do all; no, nor the best part. A man's mind, like his eating and breathing, belongs to himself; and I should be as sorry to have my *thinking* done by my neighbour, as to have him eat up all my bread and potatoes, when I am as hungry as he is. I do not know why Colonel Maceroni, or anybody else, should have the better of me or my reader in that affair of the boots. I advise you to see to it, at any rate. And do you ask what is the colonel's recipe? I'll tell you what mine is. Go, see for yourself, my good friend. You might have invented it as well as he; but as you have not, do the best you can: read it, remember it, and practise it. Do the same in other matters. Keep a bright look-out. Take care of yourself. Mind your business. See, hear, read, think; and, my life on it, you'll come out as well as Colonel Maceroni.

There is a great deal which passes for luck, which is not such. Generally speaking, your "*lucky fellows*," when one searches closely into their history, turn out to be your fellows that know what they are doing, and how to do it in the *right way*. Their luck comes to them because they work for it: it is luck well earned. They put themselves in the way of luck. They keep themselves wide awake. They make the best of what opportunities they possess, and always stand ready for more; and when a mechanic does thus much, depend on it, it must be *hard* luck indeed if he do not get, at least, employers, customers, and friends. "One needs only," says an American writer, "to turn to the lives of men of mechanical genius to see how, by taking advantage of little things and facts which no one had observed, or which every one had thought unworthy of regard, they have established new and important principles in the arts, and built up for themselves manufactories for the practice of their newly discovered processes." And yet these are the men who are called the *lucky fellows*, and sometimes envied as such. Who can deny that their luck is well earned? or that it is just as much in my power to "go ahead" (as the Yankees say) as it was in theirs.—*From an excellent little book, called Hints to Mechanics.*

EXTREMES.

A LIABILITY to go to extremes in all things, is characteristic of some minds, while others observe a moderation in all things. No doubt this is a good ordination upon the whole, probably because it is desirable that examples of every kind of conduct and every degree of opinion, even the most extravagant, should be held up before the eyes of the multitude, to lead, to discover, and to warn. All experience, at the same time, shows that, when extremes are acted on, the immediate result is rarely so good as if a medium had been observed. The utmost rigour of law is proverbially pronounced to be the utmost extremity of injustice. Excessive wisdom, excessive amiableness, rigid righteousness, all of them are liable to be interpreted by the common sense of mankind as only varieties of folly. An extreme predilection for any one thing, in our tastes or amusements, is, in like manner, apt to appear ridiculous, though in itself innocent, and to a certain extent respectable. In a word, there is nothing in the world which does not excite the disapprobation and contempt of mankind, when it is presented to them in its most extreme forms, while, on the other hand, it is difficult to recollect any thing which has not an approvable medium.

If we only set ourselves for a few minutes to recollection, we shall be at no loss for examples to illustrate these truths. As one out of many—To adhere firmly to a conscientiously entertained opinion, or to a course of action which may appear to have a good end in view, is universally acknowledged to be laudable. But the opinion may be erroneous (for all men are liable to error), or the course of action may be injudicious; and it may consequently be desirable that the individual should listen to other minds for counsel and better direction. Should he refuse to do so, and continue to think and act against all truth and all prudence, he will manifestly be doing wrong. His principle, which in a certain extent was laudable, then becomes reprehensible: it has been carried to an extreme. Errors of this nature, in the minds of important political personages, have caused the greatest public disasters; and we every day see it frustrating the best ends of individuals in private life. On the other hand, a too great readiness to abandon opinion, or to change a course of action, is an opposite and equally dangerous extreme. The only true safety is in a medium; that is, neither so great a fixedness as to be inaccessible to advice and counter-persuasion, nor so great a sensibility to opposing influences as to be always changing.

It is, in like manner, universally allowed that the pursuit of wealth is laudable, seeing that this desire is the great source of most of those blessings which distinguish civilised man from the barbarian. But it is only laudable to a certain extent. Avarice, niggardliness, and excessive application to business, dangerous to the health of both body and mind, are the results of this passion in an extreme; and they are generally condemned. The opposite and equally dangerous extremes are found in an indifference to wealth, profusion, and neglect of all industrious courses; and these are not less generally condemned. It is good, in short, to desire wealth, but not to desire it keenly or exclusively: it is good to spend freely, and to be easy about this world's goods, but not to spend too freely, or to be too easy. The medium is alone approvable.

Again, secrecy is necessary in many things, and it is desirable that we should be able to restrain the expression of our thoughts on many occasions. But to make a secret of every trifle, and to conceal or dissemble every thought, is detestable, and it is equally wrong to be altogether unretentive of private matters

concerning ourselves or others. A moderate degree of retentiveness, and only where the concealment has a good end in view, is evidently all that the moralist can approve of. To think very much or very little of ourselves—to be extremely rash or extremely timid—or to be extremely deferential to public opinion, or altogether regardless of it—are the well-known extremes of other dispositions, the mediums of which are clearly approveable. So it is quite proper that a man should be capable of feeling and acting upon resentment to a certain degree, but neither too furiously nor too sluggishly. In the one extreme, we have vindictiveness; in the other, we have a mildness which would allow error, aggression, and crime, to have unchecked sway. What is desirable, is an irritability sufficient to repel and check injustice, but not so great as to go beyond the bounds of reason in inflicting penalties. In short, a medium is what is desirable. There are other passions, which some have endeavoured to mortify out of their nature altogether, from a moral horror of their excesses, but which, in a medium, are perfectly good and worthy. Restraint and regulation, not extinction, is the proper treatment of these parts of our nature.

With regard to worldly condition, we find the same beauty in a medium. It is not good to be either under Afric's sun, nor exposed to the severity of an Arctic winter. The middle latitudes give a temperate atmosphere, where all the processes of organic life go on in comparative serenity. So is it not good to be in the extremes of society. Great wealth tends to produce arrogance; great penury is equally apt to produce envy. The very rich man is apt to feed too luxuriously for health; the very poor, too sparingly. Very exalted station is attended with care, and exposes to tremendous errors: very lowly station deprives of self-respect, and makes a man regardless of the public or general interest. It is best to be in one of the middle stations, where one is neither rich enough to be arrogant, nor poor enough to be envious; neither too much tempted to luxury, nor stinted of needful aliment; neither oppressed with the responsibilities of great power, nor altogether without the dignifying sense of having something to say in public affairs. The people in these middle stations are said to be, in our own country, liable to a too great straining after the style of their respective superiors, from which many evil results arise. But here we have only a good tendency in excess. It is decidedly useful and proper that individuals should wish to live as well as the grade immediately above them, because the wish is the surest means of creating the power to do so; and thus the condition of individuals is constantly improving. All that the moralist will deplore, is, that this wish should ever be entertained with too much solicitude, or indulged in without the fitting means having previously been obtained. Presuming that this wish is entertained and acted on in moderation, it cannot be doubted that the middle stations are not only those most conducive to an agreeable life, but those in which virtue is most apt to flourish.

With respect to personal habits, we find the same philosophy hold good. To be slovenly, is bad; so is it to be too elegantly or too carefully dressed, for that implies an attention to the subject that is unworthy of a man. To be dressed at the medium of care and neatness, is alone what is compatible with a just taste. To take no amusements is bad, for it deprives the mind of needful rest and recreation; so likewise it is bad to be altogether given up to amusement, for then all serious objects are lost sight of. The true plan is to take amusement in moderation. Some minds have never awakened to a taste for poetry, fiction, the imitative arts, and music, and they thus lose much

pleasure which others enjoy: again, there are some in whom nature has implanted, and use cultivated, so strong a predilection for these things, that it becomes a vice. Both extremes are bad: much pleasure may be safely derived from these things, if moderation be observed. To be very much in society is sure to deteriorate the human character, making it frivolous, and incapacitating it for taking abstract and elevated views: on the other hand, a perfectly solitary life weakens the mind, lays it open to odd fancies and eccentricities, if not to hypochondria, and ends in some instances by altogether throwing it from its balance. The medium is here also found alone salutary. Even in the simplest points of behaviour, an extreme is to be condemned. To be excessively gay, in a world where so many evils lurk around our every step, and so many onerous things call for our attention, is wrong: so is it to be always serious, seeing that the world also contains the materials of much happiness, and that gaiety in a certain extent is positively salutary. What is proper is, that we should be ready to rejoice and mourn in moderation on the appropriate occasions.

All that is here said has been often thought and said before; it squares entirely with the common sense of mankind, who long ago conferred upon the mean or medium the epithet of *golden*, as expressing the value in which they held it. It is surprising, however, how even the most obvious kinds of wisdom are apt to be overlooked in practice. Both in individuals and in societies or nations, there is at all times a great tendency to extremes: and this is very much because the one is always generating its opposite, and the pendulum is never allowed to come to rest. For example, one man ruins himself by credulity and extreme benevolence, by which others are frightened into the opposite error of excessive anxiety about their worldly interests. Another is the victim of a love of amusement, wherefore some of those who observe his fate deem it necessary to deny themselves all amusement. Some give themselves up to excessive conviviality, which causes others to become fanatically abstemious and reserved. Or it may be that the carrying of a virtue by some to an offensive extreme, causes others to lean to the opposite vice. Thus, it was the puritanism of the reign of Charles I. and the Commonwealth, which caused the profligacy of the reign of Charles II. Men that otherwise would have been good, became disgusted with all of good which that age could show, and flew to gratify outraged common sense by steeping it in folly. The present age shows a number of extremes of this kind.

When we seek for the sources of this tendency in human nature, we find that they do not lie very deep, though apt to be overlooked by ordinary observers. The tendency evidently depends on a law of the constitution of the mental faculties. All of these faculties appear to be formed on a principle analogous to one which is found to govern the parts of the physical system, namely, a healthy action in a medium, with a capability of being used, with a view to particular exigencies, in an extreme of either action or inaction, as well as in all the intermediate degrees. Every one of these faculties may be employed with propriety in a certain amount of its force, and under the right circumstances; and all errors and vices are merely a consequence of an extreme action on their part, under different circumstances from those which would justify the extreme action. For example, resentment, as already observed, is useful in a medium; and, where great offence has been offered to the moral sentiments, as by cruelty or injustice, an extreme action of the faculty for resentment would also be justifiable, governed of course by reason in the mode of its expression. But if this extreme action take place in consequence of some offence offered to self-love, and if murder or any

other unreasonable outrage be the consequence, then we have crime or vice. The more nearly we can keep by the medium in the exercise of all our mental faculties, the more likely are we to exemplify the virtues, and to enjoy tranquillity, for the extreme action is not easily adjusted to the right circumstances, although neither is it to be altogether checked. It requires to be used in moderation as to frequency, and in propriety as to occasion, and if so used, it may also be said to be employed in a medium. Thus we see, as it were in the very physiology of our mental being, reasons for holding a MEDIUM IN ALL THINGS.

HAMMERTON,

A TALE.

BY THE OLD SAILOR, AUTHOR OF "TOUGH YARNS," &c.

Few families could boast of a prouder ancestry than the Hammertons of the county of C—; but the unstrained hospitality, as well as unbounded generosity, that had marked their character, had impoverished their means, so that when young Augustus, at the age of seventeen, became the sole representative on the death of his father, he found the estates mortgaged to nearly their full worth; and he was enabled to do little more than, by the sale of personals, to raise a sufficient sum to purchase a first commission in the army, and to leave an amount in the hands of his agent to raise him a second step, should an opportunity occur to buy his promotion. But he required no superfluities; his regiment was in the revolted colonies in North America, under General Burgoyne, and in three weeks from his first mounting the scarlet, he was career-ing across the ocean for New York; where, immediately on his arrival, he proceeded up the Hudson to join, and found his corps encamped nearly opposite to Saratoga. Nature had been extremely bountiful to the young man; his stature and appearance were majestic; his manners amiable and engaging; his features remarkably handsome; but there was at times a wild and reckless impetuosity in his temper, which forced him into extremes of passion that subsequently caused him many hours of uneasiness and sorrow.

Only two days elapsed after his joining, and the disastrous affair at Bennington took place, in which Augustus was hotly engaged, and, solely by his great strength and activity, escaped the fate of his less fortunate companions, who were either cut to pieces or taken prisoner; in fact, from the successes which at first attended the royal forces, it became too customary to treat the rebellious troops with contempt and indifference; and, notwithstanding the several humiliating lessons which the former were compelled to learn, they did not grow much wiser from experience. And here it is highly worthy of remark, that British blood was opposed to consanguinity. The indomitable spirit of those who first trod the bleak New-England shore, was bequeathed to their descendants, who fought for their wives, their children, and their home—every man in such a cause was a soldier; and though Burgoyne was considered brave, yet his fondness for Indian warfare strongly embittered the feelings of the Americans against him, whilst his pompous proclamations rendered him an object of ridicule. The success of the militia and countrymen at Bennington, though rather heavy to the British as to loss in numbers, was yet more serious in its consequences, through the confidence with which it inspired the enemy. A few hundred undisciplined troops with rusty firelocks, scarcely a bayonet amongst them, and no artillery, had defeated two detachments from the army composed of veterans inured to service, well equipped, and having four brass field-pieces, which fell into the hands of the continentals, together with a thousand muskets, nearly the same number of swords, and four baggage-waggons. Before this victory, the irregulars were dispirited and alarmed, but now, elated with their triumph, they flocked to swell the ranks of the American line, and gave additional stimulus to that energy which soon afterwards set their country free.

It is no part of my intention to enter upon a detailed history of transactions connected with the insurmountable obstacles and disasters that constantly opposed and beset Burgoyne, from the period of his meeting with the check at Bennington, to the time of his surrender; suffice it to say, that in the many sanguinary contests that took place, as well as the arduous and harassing duties on the banks of the Hudson, Augustus Hammerton established his reputation for bravery, discipline, and good conduct; but even his short experience showed him that several who commanded were totally inadequate to fulfil the onerous obligations of their office; they held the enemy too cheap, till adversity taught them the necessity of respecting the valour of those foes whom they had looked upon with disdain. Wisdom with them was dearly purchased by the loss of four thousand men (many of whom were the finest in the British service), a beautiful train of brass artillery, amounting to forty pieces, and all the arms and baggage of the troops; in short, the army which had excited the highest expectations in England, and which at first spread havoc and dismay throughout the United

States, was defeated, forced to surrender, the men and officers plundered and ill used, and ultimately sent back with shame in their hearts.

In the battles that had been fought, the skill of the American riflemen had caused great slaughter amongst the British officers, so that Hammerton, at the time of capitulation, had charge of a company, to the command of which he was eventually confirmed. By the convention of Saratoga, the royal troops were to embark at Boston, but it was evidently the design of Congress to keep five thousand men from active service, for they delayed the embarkation of Burgoyne and his people as long as they possibly could, making use of pretexts and subterfuges that were both frivolous and vexatious, to justify their proceedings; and at last, contrary to the stipulations agreed upon at the surrender, the men were harshly detained in Massachusetts, then marched to the back settlements of Virginia, and scarcely any of them obtained their release except by exchange.

This campaign produced an effect upon Captain Hammerton that governed his future life; the privations he had undergone, the ungenerous treatment he had experienced whilst a captive, the incompetency of many who were placed above him, the want of subordination amongst the troops, which led to the most calamitous results, together with other circumstances, rendered him harsh and severe as a disciplinarian, when, after his exchange, he once more assumed a command; he had witnessed the evil and frequently fatal effects of a want of proper control over the soldiers, and, verging upon the opposite extreme, he became rigid in his exactions, and severe in his punishments. These peculiarities, added to the impetuosity of temper which has already been alluded to, strongly marked his future life, and proved the source of all the misfortunes by which that life was clouded. But we must not anticipate.

Shortly after his rejoining the army, Hammerton was promoted to the rank of major, and placed upon the staff of the commander-in-chief; but this not suiting his desire, for more stirring occupation he was sent in charge of a detachment to lay waste the villages in South Carolina. But Major Hammerton was not exactly the man to carry the havoc and devastation of warfare among the helpless and the innocent; whilst the atrocities practised by the Indians disgusted him beyond measure; and when, after the battle of Camden, Earl Cornwallis issued the proclamation consigning all who had taken part in the outbreak to imprisonment, confiscation of property, or death, the generous feelings of his nature revolted against a decree that afforded to cruelty, malice, and rufianism, a full opportunity of indulging unrestrained barbarity; indeed, notwithstanding his rigid notions of obedience to command, the feelings of the man almost overpowered the mechanism of the soldier, and he was on the point of retiring in disgust, when a circumstance occurred that changed the tenor of his life. In constant occupation amid the rough usages of a barbarous war, that covered the country with blood and desolation, rancour and grief, Hammerton had but little time for that social intercourse with the world which softens the asperity of human nature, and binds, by ties of endearing intercourse, the compact which constitutes man the protection of the weaker sex. He had never experienced those emotions which cause the heart-strings to vibrate; his attachments had ever been devoted to his profession. Parents, brothers, sisters, he had none; and the few relatives who had honoured him with notice previous to his departure from England, had done so in a cold and formal manner by no means accordant with his warmth of temperament; he was alone, but not desolate; the path to fame and rank was open before him, and he resolved to earn, if he did not gain, both. But still there were seasons when his milder affections longed for something gentle to cling to—something more than merely the slight friendships of the world to attach him to existence.

He was in his twenty-second year, when, in the neighbourhood of Ninety-Six, a district of the upper country of South Carolina, he encountered a party of Indians, who, in carrying out the orders of the commandant according to the proclamation of Earl Cornwallis, had attacked and destroyed the estate of a family supposed to be favourable to royalty (for on such occasions proof was not necessary), and were now carrying off their prisoners, consisting of an aged and grey-haired man, of truly patriarchal appearance, and his two granddaughters—the one, three and twenty, majestic and proud amidst the terrors that surrounded them, the other between eighteen and nineteen, shrinking with alarm from the touch of the Indians, and, with weeping eyes, clinging to her elder sister for support. Both were beautiful, though widely different in the character of their beauty. The object of the Indians was ransom; and here the authority of Major Hammerton was of no avail. The savages had but followed the strict letter of the proclamation, and that, too, even with mercy, for Mr Campbell had been guilty of concealing his only son, the surviving parent of the two females, from the vengeance of his foes; the unhappy man having obtained a British protection as a loyalist, and served in the royal army, but, subsequently, commanded a troop of cavalry in the service of the United States. This, by the decree of Cornwallis, which said, "Every militiaman who has borne arms with us, and afterwards joined the enemy, shall be immediately hanged," consigned him to a disgraceful death.

A lovely spot was the rustic cottage and grounds of Mr Campbell senior, whose advanced age rendered him incapable of taking any part in the sanguinary struggle

that was going on, but his doors were never closed against the sick or the wounded of either side, who were carefully attended and nursed so as to excite the gratitude of all; he was highly esteemed, his property respected, and his family beloved. What circumstances induced his son to quit the royal army for the continental, has never fully appeared; nor is his conduct to be defended, as he must have well known that he compromised the safety of his father and his daughters. Captain Campbell was defeated in a skirmish, and, unable to re-collect his scattered men, he fled from the field, and was hotly pursued by the enemy, who could not overtake him. The Indian allies, however, had always cast a longing eye upon the valuables in the cottage, but more especially on the ladies; and having tracked the captain to the residence of his aged parent, they at once entered the building and demanded the prisoner. Trusting to the secrecy of a particular spot, the ladies had concealed their father, and, consequently, his presence at the cottage was denied; but a young negro, in expectation of reward, betrayed the place of his concealment. He was dragged forth, and though beauty and age pleaded for his life, yet they pleaded in vain. Only time was allowed him to embrace his children, and bid farewell to his heart-broken father, for in less than ten minutes from the period of his discovery, his body was heaving with convulsive death throes as it hung suspended from the branch of a favourite tree, round the trunk of which his children had been accustomed to play in earlier years. But Indian cupidity and cruelty was yet unsatiated: the valuables were removed—the cottage burned to the ground—the plantings laid waste, and that which had been a smiling paradise, was in a few hours a scene of ruin and devastation. All would have probably shared the same fate (for by the decree all were equally culpable), but the avarice of the savages induced them to spare the females, under the conviction that their redemption would be purchased by some one.

Such was the position of affairs when Major Hammerton encountered them, and, for the first time in his life, love made an impression on his heart. The weeping Elizabeth clung to his knees, and with beseeching looks, as well as earnest entreaties, implored him to save them from their implacable and cruel foes. Never did the bloody ruthlessness of war appear more hateful to Hammerton than at that moment; but he knew the wily character of the barbarians he had to deal with, and therefore he endeavoured to restrain the impetuosity of his temper, till, thrown off his guard by the impassioned appeals of the beautiful girl, who fancied that the major's coolness proceeded from indifference as to their fate, he demanded their release. Alas! he was in a moment sensible of the illegality of his request, as well as the impossibility of enforcing it; for, except a corporal and an orderly, he was unattended, whilst the Indians mustered thirty men. The tribe belonged to the most murderous in that part of the world, and the chief instantly became sensible of his advantage.

"My brother does not speak with the tongue of wisdom," said he, calmly; "the father of his people has decreed death for treason—is it not so?"

By "the father of his people," Hammerton well understood that Cornwallis was meant; and although distressed beyond measure at the conviction, yet the fact was undeniable, that they were at the mercy of their captors. The place they were in was far distant from any of the posts; it was a piece of scenery rich in wild luxuriance. There was the tangled foliage, with its many shades of green, enveloping the dark-skinned warriors in their paint, who surrounded the prisoners, together with the major and his men, whose scarlet dresses, mingling with the drapery of the ladies, gave a vivid effect to the picture. The chief stood in the centre with his battle-axe poised upon his arm, and proposed to release his captives for a ransom.

"Name the amount," exclaimed Hammerton, with eagerness, while the full blue eyes of Elizabeth beamed upon him through her tears with gratitude.

The chief enumerated his services, the scalps he had taken, the wounds he had received, enhanced the beauty and qualifications of his prisoners, extolled the generosity of the British, and then concluded by demanding an enormous sum for the release of the ladies and their father. Hammerton felt an inclination to promise the amount, however extravagant, but his principles of honour and honesty revolted at the thought of deception; besides, he had those to deal with whom it was very difficult, if not altogether impossible, to deceive. The Indians were able and willing auxiliaries against the continentals, and it was dangerous to depart from a strict line of integrity in dealing with them. Still, Hammerton felt that the ransom demanded was far beyond his immediate means; and, therefore, after a plausible harangue, in which he depreciated the value of the captives, he finished with offering something more than half the sum demanded. The chief betrayed no emotion; there was not the slightest symptom of anger or resentment; not a muscle of his countenance changed; but, raising his tomahawk, he cleft the skull of the elder of the sisters, who fell dead at his feet. The spectacle which followed no pen can describe; the aged grandfather sank prostrate on the body of his son's child; the kneeling sister clasped her hands in speechless horror, and gazed with stupefied amazement on the deed. Hammerton's sword was instantly out, but a dozen bows were bent, and the arrows drawn to the head, against his breast. The corporal and the orderly held him back, and prevented him from rushing on certain destruction, whilst the chief, with foisted

arms, remained unmoved at the sight of the bleeding victim before him. At length

"My brother is a chief," said he, pointing to the major's uniform; "his captives are his own, and the Huron does not interfere; why then should my brother be angry with his friend for making the ransom less?"

The truth instantly flashed upon Hammerton's mind; in lessening the amount proposed, he had unwillingly consigned the noble-minded Matilda to death; for the savage, artful in his bargain, would not reduce the terms for the three, but, by putting one of them aside, he at once entered upon the major's offer, which he agreed to accept, and which the officer now unhesitatingly pledged his word should be forthcoming. The usual preliminaries being arranged, the Indians resigned possession; but on raising the venerable man, it was discovered that his spirit had passed away, and he was spared the infliction of further agony. The bodies of the dead were conveyed to the nearest post, where they were consigned to the tomb, and as soon as circumstances would admit, Elizabeth became the major's wife; and one more affectionate, more faithful, or more devoted, never existed. But, alas! their union was not destined to endure. Mrs Hammerton expired in giving birth to her second child, and the major was left with a bereaved heart, that was never to love again, and two infant sons.

We must now pass over a series of years, during which Hammerton was promoted to be lieutenant-colonel, and served in Holland, and other places, till the expedition against South America, when his regiment embarked, and was conveyed to the river Plate. Both his sons held commissions under their father, and experienced from him that rigid discipline for which he had become proverbial, and which deadened the confidence and filial feeling that a child should cherish for his parent. But still he denied them no indulgence consistent with their profession, and never suffered an opportunity to escape which promised to advance their welfare, and, as he thought, their happiness. The eldest, Augustus, combined in his disposition the high-spirited notions of his father, with much of the softened feelings of his mother: the youngest most strongly resembled the latter; and both were admired and beloved by the regiment, in which they had in fact been educated. Soon after landing, having marched to the neighbourhood of Monte Video to besiege the city, the young lieutenant became acquainted with a Spanish family, resident at a large farm about seven miles from the city walls, and near to which a strong post had been established to cut off all communication with the interior. The command of this post was given to Colonel Hammerton, and the young lieutenant, with a detachment of the regiment, remained with his father. Those who have been in South America must well recollect the fascinating beauty of the females who seduced many a soldier from his duty and allegiance, and induced them to desert, notwithstanding the rigid watchfulness of the commandant, and the severe punishments inflicted where the delinquent was caught.

Donna Isabella, the eldest daughter at the farm, was extremely lovely, and she possessed those manners which could not fail to attract admiration, as well as to attach the affections of a heart like that of the young lieutenant; in short, they became mutually bound to each other, and entered upon their earnest ardent love, as if it was the only desirable good or delight of existence. Colonel Hammerton was ignorant of this; for the young man was aware that if it came to his father's knowledge, he should be removed to a distance, and therefore the lovers communicated in secret, and met as often as prudence would allow. But at length the dispositions for storming the city were made, and Colonel Hammerton and his men were ordered to join the main body. But the colonel had received intelligence of a strong force of irregular cavalry and guerrillas advancing upon his post, which it was absolutely necessary to keep in check; he therefore determined to dispatch his son to the general, informing him of the circumstance, and requesting further advice. Augustus received directions to be prepared for departure by daylight the following morning, and strict injunctions were given that no one was in the mean time to quit the fort. Evening approached, and Augustus longed to ride to the farm to acquaint Donna Isabella that he was about to leave her, but would return as speedily as possible, and claim her as his bride. But his father kept him in his presence, giving him various instructions, and enjoining upon him a strict adherence to integrity of purpose: it was late before they separated, and the last words of the commandant were, that the lieutenant should hold himself in readiness at a moment's warning to mount and be off. Sharp were the struggles in his breast between love and duty: the young man revered his parent, but he felt convinced that even the near relationship between them would not screen him from the effects of a breach of military discipline; and yet his very soul sickened at the thoughts of leaving the place without one parting word with Isabella.

It happened that the sentry at the gate was a young soldier, whom Augustus had more than once saved from punishment, and the grateful fellow longed to testify, by some means or other, his sense of the obligation. Love overcame reason in the officer's breast, and he easily prevailed upon the sentry to allow him to take his post whilst he ran to the farm for the purpose of delivering a note to Donna Isabella, informing her of his almost immediate departure, and earnestly soliciting her to accompany the bearer, that they might enjoy

a few minutes' interview. Wrapped in the greatcoat of the soldier, the young lieutenant entered the sentry box, and, leaning against the side, weariness overpowered him, and in the midst of ruminations of happiness, he fell asleep.

It was a still, calm, cold night; the stars were brightly shining, and in the tranquillity that prevailed, none could have conjectured that the demons of mischief were abroad to work evil. Yet so it was. The colonel, restless at the news he had received, could not remain in his quarters; he rose, and after pacing the platform for several minutes, an irresistible impulse urged him to proceed towards the gate. The sentinels had promptly challenged, and received the countersign as he approached, but at the most important post no one was to be seen, not a voice heard. The wrath of the commandant was raised to a pitch of ungovernable fury. He advanced towards the box, saw the supposed sentry asleep; his sword was instantly plucked from the scabbard and plunged through the young man's heart; the colonel heard one heavy groan as the body fell to the ground, and he then passed on to the guard-house, to direct another man to be sent to the gate, and a party to remove the dead. But, in the mean time, the sentry returned with the lady, and, discovering what had occurred, he fled and joined the ranks of the enemy. The colonel was still in the guard-house when the corpse, together with the distracted Isabella, who had been found prostrate on the bleeding body, were brought in. But who can paint the stern agony of the father when he beheld the lifeless form of his son, slain by his own hand through intemperate zeal, and heard the curses, "not loud but deep," that were muttered by the guard. After perpetrating the rash act, reflection had wrought contrition; but now, what were his feelings as they extended the fine manly figure of the young man upon the table, and he saw in a moment that life was extinct; all the rigour of the soldier gave way, and the strong man wept like a helpless infant. But we must pass over the scene. Isabella became an idiot; the colonel was tried and acquitted, but he retired from the army. His second son could not be prevailed upon to quit his father, and, obtaining leave of absence, they returned to England. Here they found that the agent in whose hands he had left the business of clearing the encumbrances from the family estate, had succeeded beyond his most sanguine expectations—it was free, and he took possession. But remorse preyed upon his mind, and he determined to withdraw from the world, to some wild spot where he might toil and nurse his grief in secret. By the death of a relative, the place on Mahaica Creek was bequeathed to him, and thither he went: nor would his son remain behind; he disposed of his commission, and employed his days in striving to soothe the affliction of his parent's heart. The estate was not large, and required but few slaves; yet on the arrival of Hammerton, he made them cease from labour, gave them small allotments for themselves, merely retaining their services when required, and he commenced his own personal exertions in the construction of his botanical garden. Hospitable and generous, all found plenty and a welcome at the Solitaire, but he himself was seldom seen. The son sometimes drove to the town—the father, never; yet exercise renewed his health; the climate agreed with him; a desire to revisit the world, and place Edward in the seat of his ancestors, was reviving in his breast, when an occurrence took place that once more plunged him into misery and madness.

Whatever was the colonel's motive for suffering his negroes to live in comparative idleness, certain it is that the plan produced disastrous results, not only to himself, but also to the neighbouring planters; for the Solitaire soon became the refuge for the runaway, and a rendezvous for all bad characters, who were easily concealed by day in the thick bush that had been suffered to grow undisturbed, and at night, when necessity compelled them, they engaged in marauding excursions for subsistence. Nor were the colonel's grounds more free from depredations than those of his neighbours; whilst his tender plants, reared with much care and labour, frequently were trodden down and destroyed. Remonstrances and threats were equally unavailing, till at length he determined to make an example of the first marauder he could catch. For this purpose he secretly sallied forth after nightfall, armed with his rifle. Edward, however, detected his father's watchings, and, apprehensive that he might fall into ambush, generally contrived to be near him, though unseen. Nor were the negroes so ignorant of his whereabouts as he imagined, but, unwilling to do him personal injury, they hoped, by intimidation, to deter him from his practices; and, therefore, on one occasion they assembled in a body and entered the grounds. But the rascals had miscalculated their powers: the colonel was insensible to fear, and boldly advanced upon the slaves, who, terrified at his daring, turned to retreat. Edward witnessed the whole, and suspecting that the design of the negroes was to tempt his father into the bush, he rushed forward with the intention of preventing him. Had he spoken—had his voice been heard—the catastrophe might have been spared, but, eager to save his parent, he thought not of himself. The night was dark; the colonel beheld some one hurrying with rapidity upon him, and, satisfied it was a reprobate slave, he raised his rifle. It was the work of a moment—there was a report—a flash; the young man sprang from the ground with a piercing shriek—he was mortally wounded.

For several days did the agonised father watch over

the couch of his dying son, and could his sufferings have appeased the angel of death, his life might have been prolonged; but the decree had gone forth, and, with his last breath, endeavouring to console his distressed parent, he expired. Thus fell two fine youths by the impetuous hand of a father, who, in losing his children, was indeed bereaved and alone in the world. Once again he was tried for shedding the blood of his offspring, and as before an acquittal followed; but, bowed down with the affliction, his mind gave way under the heavy pressure, and for months he passed his whole time over the grave of Edward, who was buried by the creek side. A tomb was ordered from England, and placed upon the spot; a shrubbery in that luxuriant clime quickly grew around it, and the boatmen, as they row up and down, tune their chaunts to the memory of the departed.

Plantain grow round white man grave.

Sing sadly row:

Plantain grow round white man grave.

Sing sadly row.

The colonel lived several years after my visit, a melancholy monument of the evils which spring from rashness and ungoverned resentment. He was at length found dead by the side of his son's tomb.

SKETCHES IN NATURAL HISTORY.

SEA-BIRDS.

ONE of the most remarkable phenomena which are observed at sea by passengers in vessels sailing to distant countries, is the number and variety of birds whose lives seem to be spent on the face of the deep. Sea-birds are among the most interesting of the works of nature. They belong to the same order of creatures as the birds that live and swim on inland waters, of which the swan, goose, and duck, are familiar examples. This order, in the Cuvierian arrangement of the feathered creation, receives the name of the *Palmipeds*, which term indicates the main characteristic of the whole order, namely, their *webbed feet*. The web-footed birds, including both the salt-water and fresh-water divisions of them, have also various other striking peculiarities of structure, fitting them for the extraordinary mode of life they pursue. Their bodies are arched beneath, and bulged like the hull of a ship, while the neck, rising from a projecting breast, represents a prow, and the short thick tail serves the office of a rudder. The feet and legs are short, and placed far back on the body, so as to adapt them admirably for the duty of oars, with the aid of the broad webs between the toes. The shortness of the legs fulfils another important purpose, by enabling the birds, when swimming, to plunge their necks, which are comparatively long, below the level of their feet, and so to procure their food. Another and still more useful provision in the structure of these birds, is the oily secretion with which their skin and bodies generally are furnished in great quantities, and which moistens their plumage so as to prevent it imbibing humidity, or being injured by the salt contained in the element on which many of them live and move. By this provision, their bodily warmth is also maintained in spite of long-continued contact with the cold waters. These are peculiarities common to all the *Palmipeds*, but the sea-birds have qualities proper to themselves. They have the most astonishing powers of flight, and, accordingly, are remarkable for the strength and muscularity of their wings; "this structure (to quote the words of Audubon) being essentially requisite for birds that traverse such large expanses of water, and are liable to be overtaken by heavy squalls." Other characteristics of the marine *Palmipeds* will be noticed in describing individuals of the order.

The most common and best known of all sea-birds is the Petrel, to one variety of which our sailors give the appellation of Mother Carey's Chickens. It might be somewhat difficult to discover the origin of this designation, but the source of their more legitimate one is well understood, and is fanciful enough. Besides the faculty of swimming, this bird possesses the power of supporting itself on the water, by striking very rapidly with its feet; and hence they have been compared to *St Peter* walking on the water, and have got the name of Petrels. The French call them *Petit Pierre* (Little Peter) from the same cause. The Stormy Petrel, or Mother Carey's Chicken, is not much bigger than a lark, and altogether brown, except the posterior portion of its body, which is white. There is also a white stripe at the end of the great wing-coverts. The Petrel is to be seen in almost all seas from one pole to the other, and often at immense distances from land. In fact, they live so much upon the sea, that their presence cannot be taken by mariners as any indication of the proximity of land. They sleep as soundly and securely on sea as on shore. The Petrels are the inseparable companions of ships on long voyages, being seen daily in greater or lesser numbers. Sailors have a common notion that when they rest on the rigging of vessels, as they occasionally do, a storm is most certainly at hand; and it is natural that the birds should seek a refuge when their instinctive knowledge of the state of the atmosphere indicates to them the approach of a tempest. They often fall victims, on such occasions, notwithstanding the uncommon strength of their wings, which enables them to fly with ease in the face of an ordinary breeze. Their usual flight is so rapid that the eye follows them with difficulty, although they move their wings extremely little, seeming to hover along the surface of the water rather than to fly. Small fishes, dead octopuses

animals, marine worms, and the spawn of fish, appear to be the food of the Petrels, and they have the power of ejecting this food from their stomachs at any time after swallowing it. This answers an obvious purpose. The length of their flight renders it impossible for them to carry food in their bills to their nests, which are built on precipitous rocks by the sea-shore; and hence their young could not be nourished without some such way of retaining the food securely till the proper time, and of giving it up at the moment it is required. Besides, the half-digestion undergone by the food will probably be no slight addition to its acceptability. A natural oil lies always in large quantities on the stomach of the Petrel, and seems partly to serve as food to the young birds, as well as to be a defence to the creature against its enemies; for it squirts out this fluid into the eyes of its assailants, and human beings have frequently lost their lives by tumbling down precipices, when blinded by this unexpected discharge.

Audubon thus speaks of a dark-greyish-brown variety of the Petrel, which is known by the name of Wilson's Petrel:—"A long voyage would always be to me a continued scene of suffering, were I restrained from gazing on the vast expanse of the waters, on the ever-pleasing inhabitants of the air, that now and then appear in the ship's wake. Ever flapping its winglets, I have marked the little bird, dusky all over save a single spot, the whiteness of which contrasts with the dark hue of the waters and the deep tone of the clear sky. Full of life and joy, it moves to and fro, advances towards the ship, then shoots far away, gambols over the swelling waves, dives into their hollows, and twitters with delight as it perceives an object that will alleviate its hunger. Never fatigued, the tiny Petrels seldom alight, although at times their frail legs and feet seem to touch the crest of the foaming wave. I love to give every creature all the pleasure I can confer on it, and towards the little things I cast over the stern such objects as I know they will most prize. Social creatures! would that all were as innocent as you! There are no jealousies, no bickerings among you; the first that comes is first served; it is all the result of chance; and thus you pass your lives. But the cloud gathers, the gale approaches, and our gallant bark is trimmed. Darkness spreads over the heavens, and the deep waters send back a blacker gloom, broken at intervals by the glimmer of the spray. You meet the blast, and your little wings bear you up against it for a while; but you cannot encounter the full force of the tempest; and now you have all come close beneath me, where you glide over the curling eddies caused by the motion of the rudder. You shall have all possible attention paid you, and I shall crawl to the camboose, in search of food to support your tiny frames in the hour of need. But, at length, night closes around, and I bid you farewell. When morning comes (continues this most agreeable of writers), the dusky wanderers are again seen around us; the rudder-fish, yesterday so lively, has ended its career, so violently it is beaten by the waves against the vessel; and now the Petrels gather around it, as it floats on the surface. Various other matters they find; here a small crab, there the fragments of a sea-plant. Now over the deep they range, and now with little steps run on the waters. Few are their notes, but great their pleasure, at this moment. It is needless for me to feed them now, and therefore I will return to my task." The notes here alluded to have the sound of *kee-ro-kee-kee*, but some species have a slightly different cry.

The Common Stormy Petrel, the Forked-Tail Petrel, and Wilson's Petrel, are the most common varieties of these birds found on the Atlantic, and some of them occur at all points between the old and new worlds. There is another species worthy of a little notice. This is the Fulmar Petrel, or the Fulmar, as it is often simply called. The Fulmar spends the summer and breeding season in northern latitudes, and returns in winter to more southerly climes. It frequents but one place on the British coasts, the island of St Kilda. Like other Petrels, the Fulmar has large quantities of oil on its stomach, and it feeds its young solely with this liquid. The inhabitants of St Kilda use this oil for their lamps, but, to procure it, they are obliged to kill the birds by surprise, otherwise the oil would be squirted out in self-defence. The Fulmars are pretty large birds, measuring about sixteen inches from head to tail, and their plumage is greyish blue on the back and wings, and white on the inferior part of the body. They are assiduous attendants on whaling-vessels in the arctic seas, and devour greedily the fat of whales, and other food of a similar kind which may fall in their way. The Shear-Water, the Dusky Petrel, and the Pacific Petrel, are other varieties of this division of birds, found in various seas on the surface of the globe. They differ little in size and colour from one another.

The other kinds of sea-birds resembling the Petrels more or less in habits, and belonging like them to the web-footed order of Cuvier, are the Albatross, the Gull, the Tern or Sea-Swallow, the Frigate-Bird, the Booby, and some members of the Duck tribe, besides several others. The most of these birds are much more circumscribed in their range than the Petrel. The Albatross has its habitual dwelling in the Austral Ocean, from the Cape of Good Hope to Holland, and is found also on the coasts of Kamtschatka. The Wandering Albatross, the most common species, is so large as to be called by our sailors the Cape Sheep, which title its white body renders not inapplicable.

Its cry is said to resemble the cry of an ass, both in tone and volume of sound. Like all others of the Palmipedes, the Albatross is a very bad walker, and rises with difficulty, but when once on the wing, it flies easily, and skims along the surface of the water with great rapidity. They often proceed to immense distances from land, and, like the Petrels, can sleep on the water with perfect comfort. It used to be reckoned a heavy crime among sailors to injure this bird, and upon this notion is founded the poem of Coleridge, called the Ancient Mariner. The Albatross lives on fish and marine remains, and is extremely gluttonous, being easily caught by the rudest bait.

The Gulls form a numerous tribe of birds, all of which frequent the neighbourhood of that element for which the structure of their bodies and palmated feet naturally fit them. Some Gulls are occasionally to be met with more than a hundred leagues from land. The Gull is one of the most beautiful of all the sea-birds; the breast is generally pure white, and the back and wings a bluish grey; the appearance of the creature is therefore light and attractive. It is a remarkably keen-sighted animal, and darts upon its finny prey from a great height above the surface of the water. It both flies and swims well, being able to brave the wildest tempest through the great strength and length of its wings. Gulls breed on rocks, or sandy beaches, and sometimes on trees. Terns, or Sea Swallows, are small fork-tailed birds, resembling the land swallow in shape. Terns are never seen to swim, though web-footed. They do not leave the land so much as the preceding birds. The Frigate-Bird is of the Pelican division of the Palmiped order. The Pelican is one of the largest of water-birds, measuring sometimes six feet in length from bill to tail, and twelve feet from wing-tip to wing-tip. Notwithstanding its size, it flies and swims with wonderful ease and power. The common Pelicans, however, live as much inland as at sea, but, as its name in some measure imports, the Frigate-Bird is more properly an ocean bird. It is larger than most eagles, and is found in all the intertropical seas. Audubon thus describes it. "When the morning light gladdens the face of nature, the Frigate-Bird, on extended pinions, sails from his roosting-place. Slowly and gently, with retracted neck, he glides, as if desirous of quietly trying the renovated strength of his wings. Towards the vast deep he moves, rising apace, and, before any other bird, views the bright orb emerging from the waters. Pure is the azure of the heavens, and rich the deep green of the smooth sea below; there is every prospect of the finest weather; and now the glad bird shakes his pinions; and far up into the air, far beyond the reach of man's unaided eye, he soars in his quiet but rapid flight. There he floats in the pure air, but thither fancy alone can follow him. Would that I could accompany him! But now I see him again, with half-closed wings, gently falling towards the sea. He pauses a while, and again dives through the air. Thrice, four times, has he gradually approached the surface of the ocean; now he shakes his pinions as violently as the swordsman whirls his claymore; all is right; and he sweeps away, shooting to this side and to that, in search of prey. Mid-day has arrived, and threatening clouds obscure the horizon; the breeze, ere felt, ruffles the waters around; a thick mist advances over the deep; the sky darkens, and as the angry blasts curl the waves, the thunder mutters afar; all nature is involved in gloom, and all is in confusion, save only the man-of-war bird, who gallantly meets the gale. If he cannot force his way against the storm, he keeps his ground, balancing himself like a hawk watching his prey beneath; but now the tempest rages, and, rising obliquely, he shoots away, and ere long surmounts the tumultuous clouds, entering a region calm and serene, where he floats secure, until the world below has resumed its tranquillity." When the Frigate-Bird has seized its fishy prey, and has carried it aloft, he exhibits great agility in swallowing it. The American naturalist saw the bird "mount with a large fish in his bill, and then, tossing it up, catch it as it fell, but not in the proper manner. He therefore dropped it, but before it had fallen many yards, caught it again. Still it was not in a good position, the weight of the head, it seemed, having prevented the bird from seizing it by that part. A second time the fish was thrown upwards, and now at last was received in a convenient manner, that is, with its head downwards, and immediately swallowed." Considering that the bird measures upwards of seven feet between wing-tip and wing-tip, it must be a splendid object to the mariners in the tropical seas. But the bird, notwithstanding its power of wing, does not leave the land to such distances as the Petrel or Albatross. Still the Frigate-Bird passes many of its nights on the waters, except at the time of breeding. The general tint of its body is brownish black, and its bill strong and broad.

The Booby is a large bird, about two and a half feet in length from head to tail, and is found in almost every sea on the globe. It has received its common name from its supposed dullness and stupidity in permitting itself to be knocked down and killed when it chances to settle about ships. But this only occurs when the bird is excessively fatigued, and the shortness of its limbs, and inability to rise, ought to be taken into consideration before the creature is charged with any uncommon degree of stupidity. Its flight is easy and graceful, but it seldom goes to a very great distance from shore.

To this list of the birds which are familiar to sailors as the inhabitants of the ocean's surface, others might be added, but these are the most common and notable ones. The general provisions which fit them for their remarkable mode of life, have been already noticed. The quantity of oil they contain renders their bodies almost too rank and rancid to be food for man; but from the same cause their feathers are most valuable for stuffing beds and other similar purposes, on account of their power of resisting humidity. The Fulmar is eaten by the St Kilda people, but this arises from the scarcity of other food. Even the common goose and duck, which belong to the Palmipeds, are too strong, as is well known, to be very desirable food.

SONGS OF BERANGER.

FIFTH ARTICLE.

We have for some time lost sight of our friend and favourite, Beranger. Again, however, let us enter his gallery of beautiful and exquisitely finished cabinet pictures, and select a few from the varied collection. Here is a sketch, executed while Beranger lay, a political prisoner, in the cells of La Force. It is entitled

THE PRISONER'S FIRE.

Right sweet society the captive owes
To his low fire, when nights are cold and long!
By me a sprite now sits, and toasts his toes,
And chats, or rhymes, or hums some fine old song.
He in the glowing embers makes me see
Forests and seas—a universe at will,
And with the smoke away my sorrows flee:
Oh, kindly sprite! amuse and cheer me still.
Restoring youth, he makes me dream—smile—weep,
Or lulls my age with memories of the past.
Lo! at his touch, across a stormy deep,
I see a ship careering free and fast.
Three masts she has—On! on! and soon her crew
In lovelier climes will drink of spring their fill;
I only cannot bid the shore adieu!
Oh, kindly sprite! amuse and cheer me still.
What see I now? an eagle soaring high,
Scanning the height of the imperial sun?
'Tis a balloon: see how her streamers fly!
And now the eye hath boat and boatman won.
Oh, if his daring breast know pity soft,
For those chained here it now most keenly thrills:
How pure and free the air he breathes aloft!
Oh, kindly sprite! cheer and amuse me still.
A Swiss canton, lo! now the embers form,
With glaciers, torrents, valleys, lakes, and flocks.
Why fled I not when I foresaw the storm,
And Freedom showed this home amid the rocks!
I would pass o'er these heights to where our flag
Still waves, methinks, as on a giant hill:
Away from France my feet I ne'er could drag—
Oh, kindly sprite! amuse and cheer me still.
A new mirage within my desert show!
Come, sprite, and roam we o'er these wooded slopes.
In vain there comes a whisper, soft and low,
"Be wise and bend the knee—your chain straight drops."
Thou who, despite the watchful turnkey band,
To make me young at fifty hast the skill,
Come, strike the fire again with magic wand!
Oh, kindly sprite! cheer and amuse me still.

In the second last of these stanzas, the poet alludes to an offer made to him of a refuge in the Swiss cantons, when he was first threatened with persecution at home; and in the first verse of the last stanza he refers to a private communication made to him on the part of the Bourbons, that a little timely concession, or display of penitence, would have the effect of softening the rigours of his doom. Beranger complied with neither of these offers; in the first instance, because he loved France too well ever to leave her voluntarily; and in the second, because the resources of his own mind brought him sufficient solace, enabling him, as we have seen, to conjure up a conversable companion even in the embers of his lonely prison-fire.

The next piece which we shall present from Beranger's collection, is one of date 1815, and which was evidently intended to soothe the recently excited feelings of his countrymen, and to produce peace and mutual forbearance between the two great parties which then changed places in France. Leaving such considerations out of sight altogether, most readers will probably agree with us in thinking the piece very pretty as a mere poetical composition.

THE OLD MINSTREL.

An humble, aged man am I.
The minstrel of this hamlet small:
Yet people wisdom in me spy,
And I have wine—unmixed—at call.
Come, and beneath the shade this day
Haste to unbend yourselves with me,
Fa, la, ye villagers, fal, lay,
Come dance beneath my old Oak Tree.
Yes, dance below my aged oak,
That stands our village inn before:
Discord still flits away like smoke,
Whene'er its boughs are waving o'er,
How often hath its foliage grey
Beheld our sires embrace with glee!
Fa, la, ye villagers, fal, lay,
Come dance beneath my old Oak Tree.
Pity the baron in his hall,
Although he be your manor's lord;
He well may envy you for all
The quiet ease your plains afford.
While he is whirled along your way,
Cooped in his coach so sad to see,
Fa, la, ye villagers, fal, lay,
Dance ye beneath my old Oak Tree.
Far from a wish at church to curse
The man who spurns the church's cares—
That Heaven may kindly bless and nurse
His crops and vines, send up your prayers.
Would he to Pleasure homage pay—
Here let his shrine of income be:
Fa, la, ye villagers, fal, lay,
Dance all beneath my old Oak Tree.

When with a feeble, faithless hedge
Your heritage is circled round,
Touch never with your sickle's edge
The grain upon your neighbour's ground.
But, sure that in a coming day
That heritage your sons' will be,
Fa, la, ye villagers, fal, lay,
Dance ye beneath my old Oak Tree.

Since peace its balm diffuses o'er
The ills that fell in clustering throng,
Oh! banish from their homes no more
The blind ones who have wandered long.
Recalling—now the skies are gay—
All whom the tempests tost at sea,
Fa, la, ye villagers, fal, lay,
Dance all beneath my old Oak Tree.

Hear then your minstrel's honest call,
And haste to seek my oak's broad shade:
From each let words of pardon fall,
Here be your kind embraces made.
And that, from age to age, we may
Peace fixed among us ever see,
Fa, la, ye villagers, fal, lay,
Dance all beneath my old Oak Tree.

In almost every one of Beranger's songs, however playful and merely imaginative they may seem, there may be found something more than meets the eye at a casual glance. His mind was incessantly attentive to the condition and interests of his country; and a recollection of its recent history, together with a notice of the dates (which he usually gives) of his compositions, will enable one to discover in his very lightest effusions the influence on his mind of passing events. And the greatness of his genius cannot be better shown than in his power of making his pieces at once the vehicles of such allusions and the objects of just admiration when regarded as mere poems. The lyrics already given sufficiently illustrate this point. Here is another to which the same observations apply. It refers to friends of the poet, who were exiled for political reasons from their country.

THE BIRDS.

Doubling its force, the winter pours
Its rage upon our roofs and plains,
The birds bear off to other shores
Their little loves and loving strains.
Yet find a refuge where they may,
This ne'er inconstancy will bring;
The birds whom winter drives away
Will come to us again with spring.

The doom of exile on them falls,
Yet more than they that doom we mourn:
From palace and from cottage walls,
Echo would still their songs return!
In some more tranquil land, may they
To please a happy people sing;
The birds whom winter drives away
Will come to us again with spring.

We envy these dear birds their lot,
Fix'd peacefully on that far strand;
For ev'n now many a cloudy spot
Warns us of northern storms at hand.
And happy those who can convey
Themselves afar on agile wing!
The birds whom winter drives away
Will come to us again with spring.

They will bethink them of our pain,
And come, when flies the storm at last,
To sit 'neath that old oak again.
O'er which so many a storm has passed:
The promise of a better day
And stabler, to our vale to bring,
The birds whom winter drives away
Will come to us again with spring.

With another piece of a somewhat different character, our present versions from the French songster may be concluded. This is a tale of a purely domestic character, more in the manner of Crabbe than Beranger's compositions usually are. The translator has adopted the English ballad-style, as best suiting the character of the poem.

THE POACHER'S WIFE.

At Anna's breast an infant sleeps,
And one upon her back she bears:
Another cold and shivering weeps,
Oppressed with more than childhood's cares.
He loudly rails at armed men,
Who bear his father far away;
For they have caught him in the glen,
As craftily he sought his prey.
A poacher and a man of strife,
He roamed the forest, wild and free.
Oh! Heav'n protect the poacher's wife—
A wretched captive now is he!

A happy maid she was and fair,
At village school the master's pride;
She read, she sang, and void of care
Full busily her work she plied.
I've pressed her hand at evening tide,
Danced with her 'neath the chestnut-tree:
But Aaron claimed her for his bride,
And, oh! a captive now is he.

A wealthy swain her love once sought,
And Anna looked his lot to share,
But he his tender vows forgot
When malice mocked her ruddy hair.
Small favour with the selfish throng
Had one who lacked the penny fee:
Heav'n guard the poacher's wife from wrong—
A wretched captive now is he!

The rover wild, of lawless life,
Cried, "Black or white, I care not whether,
But I will choose thee for my wife,
And we shall live and love together.
My arm is strong, my limbs are fleet,
In vain the keepers wait for me:
And know, I have a safe retreat,
A safe retreat and rifles three.
The aged priest who meekly dwells
Within yon castle walls so high,
When sounds the chime of evening bells,
This night the nuptial band shall tie.
Then come with me, fair Anna Rose,
And let me pay the church's fee,

And thou shalt share my bed of moss,
And love me 'neath the greenwood tree."
Oh! heav'n preserve thee, Anna Rose,
Thy husband now is torn from thee!

The yearning for the sweet employ
Of wife and mother moved the maid:
And twice she felt a mother's joy
Alone beneath the forest shade.
Her children grew in beauty rare,
Like blossoms on the vernal bough.
Oh! heav'n regard poor Anna's prayer—
Her husband is a captive now!

And faithful to the heart's best duties,
Still Anna smiles, despite her care,
For in her children's opening beauties
She marks their father's raven hair:
She smiles—for in his every cross
Her smile can lighten Aaron's brow:
Oh! heav'n regard poor Anna Rose—
Her husband is a captive now!

A FEW WEEKS ON THE CONTINENT.

ENTER BELGIUM—LIEGE.

On the morning after our arrival we departed from Aix-la-Chapelle, and proceeded in a westerly direction to Liege, which we reached after a journey of seven hours. The road wound through a beautiful undulating country, well wooded and enclosed, and very much resembling some of the fine woodland counties of England. After passing the small town of Henri-la-Chapelle, a few miles from Aix, we arrived at the boundary of the Prussian and Belgian kingdoms. It is only, however, by seeing two custom-houses placed on the roadside, within a hundred yards of each other, that we are made aware of there being here a political division of the country. The Prussian establishment we passed unheeded, but were brought to a halt opposite that of Belgium. An officer in a dark green uniform ordered our baggage to be taken from the calash and brought into the house, where it was properly ransacked. Not finding any thing to seize, the inspector seemed rather out of humour, and offered us for sale boxes of eau-de-cologne (the fruit of former seizures), which, however, we declined to purchase, and left him to his reflections, after getting our passports visied. As we drove off, the diligence from Aix hove in sight, and looking back when we had gone a short way, we perceived the cumbrous machine stopped and subjected to the process of having its packages unloaded and its passengers examined—a process which could not detain it less than an hour in its journey. It is only by actually witnessing such interruptions and annoyances in travelling on the continent, that one can rightly appreciate the degree of liberty which we possess in our own country.

At Aix we had begun to notice the growing prevalence of the French tongue, and now, as we proceeded on our way within the Belgian frontier, indications of the general use of that language became every mile more conspicuous. In the villages through which we pass, we find the sign-boards to be all in French, the word "Handlung," which is common over shop-doors in Germany, being now exchanged for the more intelligible phrase "Marchande," or "Commerce," though, on pushing northwards among the Flemings, we occasionally see our old Dutch acquaintance "Te Koop." The appearance of every thing about us, on penetrating into Belgium, tells us that we have got into an entirely different country from that lately passed through. We now observe that the land is thickly peopled, and well inclosed and cultivated; also that the farmers do not all live in villages, but in many instances have separate dwellings among the fields. The farther we advance, the country becomes more like Holland in flatness, and is on all sides marked by symptoms of improvement, delightful to contemplate.

Belgium is that portion of the Netherlands lying on the south-west of the lower branches of the Rhine, as Holland lies on the north-east, and consists of the provinces of Brabant, Antwerp, East and West Flanders, Hainault, Namur, and Liege. Luxembourg, lying on its southern German border, and Limburg, which is little else than the lower valley of the Meuse, are two provinces claimed, as is well known, both by Holland and Belgium. Independently of these two districts, Belgium contains twelve thousand English square miles, and four millions of inhabitants. The political history of the country (the province of Liege excepted) is nearly the same as that of the northern provinces of the Netherlands, until the epoch of Dutch independence in 1579. The southern provinces were less successful in freeing themselves from the Spanish yoke, and hence their period of national freedom has been postponed to a much later date. In 1714, they were ceded by Philip III. of Spain to his daughter Isabella, when she espoused Albert, Arch-duke of Austria, by which change of masters they became known as the Austrian Netherlands. In 1795, they were united with France, and continued under its dominion till 1814, when they were attached to the northern provinces, to compose the kingdom of the Netherlands. Their separation in 1830, to form a

distinct kingdom, and to depend, for the first time, on their own united resources, is known to every one.*

The long train of national disasters, from the days of the Counts of Flanders, downwards till 1830, has stamped a peculiar character on the people of Belgium. Although originally of a kindred race with the inhabitants of the northern provinces, they have become widely different. The ancient Teutonic language, which has taken the form of Dutch in Holland, has degenerated into Flemish in Belgium; besides which, there is the language called Walloon, a species of old French mingled with German, and spoken principally in Hainault, on the borders of France. Nevertheless, modern French may be described as the predominating language of Belgium. Not only the literature, but all the communications taking place in respectable society and in commerce, are in French, so that the Flemish and Walloon tongues are only heard in particular districts, or among the very humblest classes. As the Dutch tenaciously hold to a language which no other nation will take the trouble to learn, they are placed at a great disadvantage with respect to commerce and the ordinary intercourse of civilised communities. This circumstance in itself, notwithstanding that French is pretty generally taught in their schools, must certainly have some effect in retarding their prosperity. The next most remarkable difference between the two countries is in the matter of religion. Whether from the reformation never having taken deep root in the southern provinces, or from their long connection with Spain, Austria, and France, it happens that the Belgians are almost altogether Roman Catholics, which gives a turn to their manners and usages, and probably leads to that assiduous cultivation of the fine arts—as architecture, sculpture, and painting—for which they have obtained not a little celebrity.

As I design, before concluding these papers, to offer an exposition of the present flourishing condition of Belgium, I may only here premise, that since its liberation from the Dutch government, it has advanced in manufactures, commerce, internal improvements, and social comfort, with a rapidity which is perfectly surprising. With as sturdy a spirit of industry as the Dutch, the Belgians are much more lively and salient, both in thought and expression, and consequently they are infinitely more improveable—that is, taking the more intelligent amongst them, and not the mere rural peasantry. With these slight explanations, we may now proceed on our journey, in which we shall have ample opportunity of noticing a number of interesting points and signals of improvement in this lately emancipated country.

On making a turn in the road from Aix, on the brow of a rising ground, we find before us the valley of the Meuse, with the busy town of Liege in its centre. The valley of the Meuse is reckoned as beautiful as that of the Wye in England, and is frequently made the object of a special tour in this part of the continent. At a point some miles above Liege stands Namur with its strongly fortified castle, which, as the reader of history will recollect, was the object of a sanguinary contest between Louis XIV. and William III. of England, the former being successful. From Namur down to Liege, the banks of the Meuse abound in picturesque and lovely scenery. On approaching Liege, the vale opens, and exhibits the lively spectacle of thriving villages, orchards, well-enclosed and cultivated fields, gardens, and, though last not least, tall chimnies belonging to steam-engines, which are employed in divers processes of manufacture. The Meuse, after passing through Liege, where it receives the smaller river Ourthe, proceeds down the vale to Maestricht in Limburg, and thence, after a course of a number of miles, falls, as mentioned in a previous article, into the Rhine or Maas, which flows past Rotterdam on its way to the German Ocean.

The sight of Liege at once reminds us of an English manufacturing town. We hail its engine chimnies and smoke as emblems both of wealth and advancement in the mechanical arts; and as we drive into its busy streets, and pass along its open quays, thronged with commerce, we are apt to inquire of ourselves, can all this be on the continent, and not in one of the manufacturing districts of England? Liege is built with little regard to regularity on the Meuse and Ourthe, across which there are several bridges. On the north-west side of the Meuse lies the principal part of the town, and in this direction are situated the chief public edifices, hotels, and open places. The Meuse being navigable for small vessels from the Rhine upwards to this point, and also navigable for still smaller craft as far as within the borders of France, it offers considerable facility for carrying on foreign commerce, and in some measure makes Liege a sea-port; should Holland, however, permanently acquire Limburg, or charlishly prevent the free navigation of the Maas for

* There are few things more infamous in history than the manner in which these provinces have been handed over from one foreign power to another, without in the smallest degree consulting the wishes of the inhabitants. Twice they have been given as a marriage portion like a common landed estate, once taken possession of by the French, and once forced into a union with Holland. Strange to say, their very misfortunes in these respects are used by certain writers as an argument against their present independence. Considering all things, it is surprising that the Belgians have had the spirit to wish for national freedom, or the intelligence to preserve it; surely great excuses ought to be made for any errors of policy into which they may chance to fall.

Belgian vessels, much of this profitable trade will be checked, or sent in a new channel.

The history of the province of Liege, of which the town is the capital, differs from that of the rest of Belgium. All who have read Scott's *Quentin Durward* will not fail to recollect the revolt of the Liégeois against their temporal and spiritual sovereign the Bishop of Liege (1468), and the horrid cruelties they perpetrated under William de la Marck, commonly called the Wild Boar of Ardennes, for which outrages the city was destroyed by Charles the Bold of Burgundy, and his ally Louis XI. Liege, it must be explained, became the seat of a bishop about the year 712, and under his successors, who held the province as a fief of the German empire, it rose to considerable wealth and importance. Whether from a natural desire for independence, or the over-strict rule of the bishop-princes, the Liégeois, in the thirteenth century, began to manifest a settled discontent with their condition, and from that period till near the close of the eighteenth century, the history of the district consists of a continuous series of troubles and civil wars. At length the conquest of the country by the French in 1791, put an end at once to these intestine discords, and the long-protracted rule of the princely ecclesiastics. The ancient cathedral of St Lambert, adjacent to the episcopal palace, was now utterly destroyed, and its site is at present an open square. When the general peace of 1814 led to a new distribution of kingdoms, the province of Liege was consigned to the Netherlands, and latterly it has remained attached to Belgium.

The old episcopal palace still stands. It is situated in the more ancient part of the town, which lies on the face of the gradually ascending ground north-west from the Meuse. It is a dark stone building of great extent and magnificence, with two open courts surrounded with pillared arcades. At the present day it forms the Palais de Justice, or provincial court-house and prison. The arcades of one of the courts are used as shops for the sale of goods by sundry small merchants.

In 1816, the king of the Netherlands, with a desire to improve the state of education in this part of his dominions, established a university in Liege, which now occupies a handsome edifice built upon the ruins of the church of the Jesuits, on the side of the Meuse. It possesses a museum of natural history, containing, among other objects of interest, nearly 3000 specimens of fossil organic remains discovered in the surrounding district. In the library of the institution the antiquary finds an equally interesting collection of books and manuscripts, amounting to many thousands in number, which have been gathered from the suppressed monasteries and abbeys of the province. The university has a body of forty-six professors, and its classes are attended by from four hundred to five hundred students.

In the days of its episcopal greatness, and before its destruction by the Duke of Burgundy, Liege contained 120,000 inhabitants. At present it has only 62,000, but is surrounded by a large population, who are engaged, directly or indirectly, with mining and manufactures. The valley of the Meuse, and the hills which bound it, are rich in mines of ironstone, zinc, lead, copper, sulphur, alum, and coal; also quarries of marble and slate. The iron manufacture is the staple of the district. The quantity of iron issuing annually from all the foundries in this southern part of Belgium, amounts to 150,000,000 kilogrammes (a kilogramme is 2½ lbs. English), valued at 55,200,000 francs. While Namur manufactures goods resembling those of Sheffield, Liege produces articles like those of Birmingham. The cutlery of Namur gives constant employment to above 5000 workmen. In Liege there are fifty manufactories of fire-arms, and in 1836, 349,379 stand of arms issued from these various establishments, valued at 7,000,000 francs. The muskets made here are reputed to be inferior in finish to those of England or France, but they are much cheaper, and thus find a ready market. Liege possesses one of the largest cannon foundries in Europe; it belongs to the state, and executes work both in iron and brass. Steam-engines and machinery are now made to a great extent in Liege and its environs, but principally at Seraing, an establishment situated two or three miles up the valley, on the banks of the Meuse, and belonging to the eminent John Cockerill.

The village of Seraing consists of a long and populous street extending along the left bank of the river, and from this the workmen daily cross in boats to the factory on the opposite side. The factory buildings, which enclose an old palace of the bishops of Liege, are of considerable extent, and on a most complete scale. Nearly every species of iron-work is here fabricated, from the heaviest engine to the most delicate or complicated piece of machinery. The average weight of articles turned out daily in the establishment amounts to 25,000 kilogrammes. Latterly, as the rage for setting up manufacturing establishments in Belgium and other parts of the continent has increased, Seraing has come in for a large share of the orders for machinery, as, for example, cotton-spinning and power-loom apparatus. At a subsequent part of my journey, I had frequently occasion to observe the name John Cockerill on the locomotive machines on the Belgian railways. I have little doubt that from the establishment of Mr Cockerill every species of machinery can now, or will very shortly, be supplied as well as from factories in England, and at a much lower cost. I

was informed at Liege that Mr Cockerill has at present in his employment 3000 individuals, and pays weekly in wages about £2000. The establishment possesses a material advantage in being placed over one of the inexhaustible beds of coal for which the district is so celebrated. The coal is consequently raised within the limits of the factory, close by the furnaces; which must be not only exceedingly convenient, but productive of a great saving of expense.

Some time previous to our visit to Liege, a branch of the great system of railways in Belgium had been extended to Ans, in the vicinity of the town, and we had therefore an opportunity of proceeding by the easiest and quickest of all conveyances to Brussels. By one of the many omnibuses which drive round to pick up passengers from the hotels, we were speedily carried to the railway terminus, where a train of carriages was in waiting, with its locomotive engine hissing and chafing, as if impatient to be off. A very few minutes served to set the whole in motion, and in a trice we were travelling at the rate of at least thirty miles an hour, across the flat central part of the kingdom. Whether from the levelness and straightness of the line, or the power of the engine, the rapidity, we felt assured, was much greater than what is usually experienced on the English railways. Yet, with all our speed, the journey from Liege to Brussels, a distance of seventy-three miles, was not performed in less than six hours. The cause of this was the number of delays which occurred at different places. The route proceeded in a north-westerly direction, by Tirlémont and Louvain (the latter one of the largest of the Belgian towns), to Mechlin or Malines, and thence in a south-westerly line to the lower outskirts of Brussels. Besides stopping at a number of stations to let off and on passengers, the train was compelled to stand at rest for upwards of an hour at one place, waiting for the coming up of the train proceeding in an opposite direction. There is throughout all the railways in this country but one line, so that trains can pass each other only at appointed places; an arrangement which, being calculated to produce both delays and accidental encounters, is exceedingly unsatisfactory, and must in time be remedied.

The extensive series of railways in Belgium, of which the above is a section, was ordained by a law passed in May 1834, the principal object in view having been a ready means of transit from the two seaport towns, Ostend and Antwerp, across the country to Liege, thence to the boundary of Prussia, and from that to the Rhine at Cologne. It was hoped that by a line of railway to this extent, the foreign traffic of Germany and Switzerland might be carried on through Belgium, instead of following the course of the Lower Rhine and Maas, which is monopolised by the Dutch. The idea was excellent, and there cannot be the smallest doubt that in a few years hence both the mercantile traffic, and the concourse of travellers to and from the Rhine, will take this direction, in preference to that by the lower channels of the Maas, which are of difficult and tedious navigation. The ready transit from various points to Brussels, and to the borders of France, has likewise guided the arrangement of the lines; and as the state, for the public interest, has taken upon itself the whole undertaking, there has been little or no opposition from private parties. The organisation of the lines is peculiar. Malines is constituted a centre, whence all the railways shoot out in different directions, like spokes from the nave of a wheel; and hence, in whatever direction you wish to travel, you are carried in the first place to Malines, and there, by a change of carriages, in the direction you desire to proceed. Thus, there are lines from Malines to Antwerp, to Ghent and Ostend, to Liege and to Brussels; a line to the frontiers of France remains to be executed. The aggregate length of the lines already in operation amounts to 255,110 metres (a metre is 39 inches), or 157 English miles, the expense incurred for which has been on an average 450,000 francs for each league of 5 kilometres (a kilometre is 1000 metres), which is about £6250 per mile, English measure. Only a small expense, I apprehend, is incurred for keeping the lines in repair, or for attendance. The rails are all placed on billets of wood laid across, and the line is seldom more than two or three feet above the level of the country. All the persons employed as guards and attendants, the office-keepers excepted, seem to belong to the army, as they are all decked out in uniforms, with cocked hats and swords. The vehicles for conveyance of passengers are roomy and handsomely fitted up carriages of the omnibus form, but entered by the sides, and having the seats placed transversely. The fares are exceedingly moderate, and such has been the concourse of passengers, that already, I believe, the first executed lines have nearly repaid all the outlay upon them.

DUDDEN AND MORECAMBE BAY EMBANKMENTS.

THE idea of carrying a railway across the extensive sands of Dudden and Morecambe Bay, Lancashire (in order to avoid the Westmoreland hills), has been considerably ridiculed, but we cannot see with what justice. The whole of Holland has been embanked to keep out the sea; why may not something of the same kind be done in England? Mr Hague of London is the projector of the undertaking, and we give him credit for his intrepidity. The length of the Morecambe Bay embankment is, we understand, ten miles and fifty-one chains, and the length of the Dudden is one mile and sixty-five chains. Mr Hague intends first to construct a frame-work of wood, by means of machinery made for the express pur-

pose, having first driven into the solid clay four rows of piles, twenty-one feet apart. This done, the open space between the piles is to be filled up, for doing which Mr Hague calculates he will require 10,453,785 tons of material for the Morecambe Bay embankment alone. Of this quantity, 6,149,379 tons will, he states, be brought in by the sea, and furnished in the bay during the progress of the works; the remainder will be taken from the cutting for the railway in Furness, and from the Poulton shore. The estimated cost for Morecambe Bay embankment is £362,361, 0s. 10d., or about £34,111, 10s. per mile, calculating the distance as above given. The Dudden embankment is estimated at £71,270, 8s. 6d., or about £39,322 per mile, calculating the distance at one mile sixty-five chains. Thus the whole estimated outlay is £434,131, 9s. 4d. The amount of land reclaimed by the embankment will be 52,000 acres, which, being taken at £23 per acre, the total value will be £1,196,000.

THE VALLEY OF POISON IN JAVA.

ALL the world has heard of the celebrated poison tree of the island of Java, with a fabulous account of the existence of which Europe was first imposed upon by one Foersch, a Dutch physician. A translation of his romance, as it ought to be called, originally appeared in the *London Magazine* for 1783-4, and from its extravagant nature, its susceptibility of poetical embellishment, and its alliance with the cruelties of a despotic government, it at once obtained equal currency with the wonders of the Lerna hydra, the Gorgons, the Chimera, or any other of the classic fictions of antiquity. Darwin the poet found it admirably adapted to his purpose in composing his poem called the "Botanic Garden," in which the vegetable kingdom is personified under various forms, and endowed with human feelings and passions. It may well be believed that the upas-tree would be represented in no very amiable light; accordingly, as a malignant demon, like the evil spirit amongst mankind, it is assigned the appropriate form of a serpent:—

"Fierce in dread silence on the blasted heath
Fell upas sits, the hydra-tree of death.
Lo! from one root, the envenomed soil below,
A thousand vegetative serpents grow;
In shining rays the scaly monster spreads
O'er ten square leagues his far diverging heads:
Or in one trunk entwists his tangled form,
Looks o'er the clouds, and hisses in the storm!
Steeped in fell poison, as his sharp teeth part,
A thousand tongues in quick vibration dart;
Snatch the proud eagle towering o'er the heath,
Or pounce the lion as he stalks beneath;
Or strew, as marshalled hosts contend in vain,
With human skeletons the whitened plain!"

Admitting the existence of such a dreadful plant as the upas, the above personification (notwithstanding the pomposity and grandiloquence of the style) is by no means bad; but now, when we know that such a tree never had existence, except in the brain of Foersch (who would have looked for such grave mendacity in a Dutchman!), one can scarcely forbear smiling on reading the passage.

But although the island of Java is no longer invested with imaginary terrors on account of the deadly upas, there nevertheless exists in its interior a place equally fatal to animal life—indeed, in this respect it is the most extraordinary spot in the whole world. It is called the *Guevo Upas*, or Valley of Poison, or of Death (a most appropriate name); in short, it may be called a great natural sepulchre, where no bird can alight, nor beast stray, nor human being set foot, and live. Dr Horsfield has the following notice of this fearful Golgotha:—"The Guevo Upas is dreaded by the natives, and, according to their account, resembles the Grotto del Cane, near Naples; but they could not be prevailed on to conduct me to this opening." In 1830, however, Mr Alexander Loudon succeeded in inducing some of the natives to conduct him to the valley in question, and an account of his visit first appeared in the *Journal of the Royal Geographical Society*, in a letter addressed to Dr Horsfield. Whilst at Batur, on the 3d of July of the above year, he was informed by one of the native chiefs that there was a "valley only three miles from Batur, which no person could approach without forfeiting his life, and that the skeletons of human beings, and all sorts of birds and beasts, covered the bottom of the valley. At this time I did not credit all that the Javanese chief told me; I knew that there was a lake at the top of one of the hills, which it was dangerous to approach too near, but I had never heard of this valley of death."

On the following day, Mr Loudon set out in company with a friend and some natives, taking with him two dogs and some fowls, to make experiments. "On arriving at the foot of the mountain, we left our horses, and scrambled up the side of a hill, full a quarter of a mile, holding on by the extended roots and branches of trees, and we were a good deal fatigued before we got up, the path being very steep and slippery, from the heavy rains during the night. When within a few yards of the valley, we experienced a strong nauseous, sickening, and suffocating smell; but on coming close to the edge, the smell ceased. We were now lost in astonishment at the awful scene below us; the valley was about half a mile in circumference, oval, the depth from thirty to thirty-five feet, the bottom quite flat, no vegetation, a few large (in appearance) river stones, and the whole covered with the skeletons of human beings, tigers, pigs, deer, peacocks, and a great variety of birds and beasts. We could not perceive any vapour or opening in the ground, which appeared to be of a

hard sandy substance. The sides of the valley, from the top to the bottom, were covered with vegetation, trees, shrubs, &c. It was now proposed by one of the party to enter the valley; but at the spot where we were, this was difficult, at least for me, as a false step would have been fatal, and no assistance could be given. We lighted our cigars, and, with the assistance of a bamboo, we descended to within eighteen feet of the bottom; here we did not experience any difficulty in breathing, but felt a sickening nauseous smell. A dog was now fastened to the end of a bamboo eighteen feet long, and sent in; we had our watches in our hands, and in fourteen seconds he fell on his back; he did not move his limbs or look round, but continued to breathe eighteen minutes. We then sent in another, or rather he got loose from the bamboo, and walked in to where the other dog was lying; he then stood quite still, and in ten seconds fell on his face, and never moved his limbs afterwards, though he continued to breathe for seven minutes. We then tried a fowl, which died in a minute and a half; we threw in another, which died before touching the ground. On the opposite side of the valley is a large stone, near which is the skeleton of a human being, who must have perished on his back with his right arm under his head; from being exposed to the weather, the bones were bleached as white as ivory. I was anxious to get this skeleton, but I soon found that any attempt to get at it would have been madness. After remaining two hours in this valley of death, Mr Loudon and his companions returned to Batur. "The human skeletons," he observes, "are supposed to have been rebels who had been pursued from the main road, and had taken refuge in the difficult valleys. And a wanderer cannot know his danger till he is in the valley; and when once there, he has not the power or presence of mind to return."

We are further told that there is not the least smell of sulphur, nor any appearance of an eruption ever having taken place near it, although the entire range is volcanic, there being two craters at no great distance which constantly emit smoke. Indeed, the whole island is volcanic, and numerous eruptions have occurred in it. It is the opinion of Sir Stamford Raffles, that the face of the country has been repeatedly changed by these convulsions, and history and tradition support the opinion. This being the case, we are to look to volcanic agency for an explanation of the cause of this remarkable phenomenon. But first let us briefly advert to some phenomena of the same nature, but on a much more limited scale, which occur near Naples.

The Grotta del Cane, or Dogs' Cave, is the most remarkable of the many grottos around Naples which are mentioned by Pliny. It is hollowed out of a sandy soil, to the depth of ten feet and the breadth of four. A light vapour is always seen rising to the height of about six inches, but no smell is emitted, except that which is generally connected with a subterranean passage. Dogs are generally the subjects of experiment with this vapour, but its effects are the same on all animals. At first they struggle considerably, but lose all motion in two minutes, and would immediately die if not withdrawn into the open air. It is known to be the presence of carbonic acid gas which produces death merely by suffocation. This grotto has lost much of its celebrity since several volcanic caverns, emitting carbonic acid, have been discovered in other countries. We may, for instance, mention the still more remarkable and deadly Cave of Secunderah on the shores of the Caspian Sea, but prefer quoting an account of another nearer home. Mr Hamilton, British envoy at the court of Naples in 1825, has given a circumstantial and admirable description of the "Lago di Amsanctus" (the *Amsancti Valles* of Virgil), in the province of Principato Ultra, in the kingdom of Naples; and from his account, which is brought forward in illustration of Mr Loudon's communication regarding the Valley of Death in Java, we extract a few facts. The description is exceedingly interesting in itself, and valuable as throwing some light on the fearful phenomenon of Java. The lake is situated about a mile and a half from Rocca St Felici, at the mouth of a valley, and close under a steep shelving bank of decomposed limestone, which bears ample evidence of having been acted upon by sulphureous acid gas. It is of a rhomboidal shape, being in its smallest dimension about twenty paces in length, and not more than thirty in its longest dimension. The water continually bubbles up over a large portion of the surface, with an explosion resembling distant thunder, though not reaching to the height of more than two feet. The water is of a dark ash colour; indeed it may almost be called black, which is the effect of its mixture with earth blackened by the effect of the sulphureous acid gas. On one side of the lake is also a constant and rapid stream of the same blackish water rushing into it from under this barren rocky hill, but the fall is not more than a few feet. A little above are apertures in the ground, through which warm blasts of sulphuretted hydrogen gas are continually issuing with more or less noise, according as the opening is large or small. "On the opposite side of this small lake is another but smaller pool of water, on the surface of which are continually floating, in rapid undulations, thick masses of carbonic acid gas, which are visible a hundred yards off. This pool is called the Cocciaio, or Cauldron, as having the appearance of being perpetually boiling." The larger lake bears the appellation Mephitis.

The vapours arising from these waters are at times

fatal, particularly when they are borne in a high wind in one direction. "In calm weather," says Mr Hamilton, "as was the case while we were there, the danger is much less, as the carbonic acid gas will not, in its natural state, rise more than two or three feet from the ground, so that we could walk all round the lake and cauldron, and even step over some parts of it; but it was necessary to take care not to slip, so as to fall; as a very short time, with our faces too near the ground, would have sufficed to fix us to the spot. As it was, I had much difficulty in filling a small bottle with the water from the lake, as I was obliged to hold my head up high while I bent down; nor could I stoop low enough to place an insect on the ground, on which I wished to try the experiment how long it could live on it; but we saw the dead bodies of many strewn upon the ground all round the lake. They say birds, too, sometimes fall down dead either into the lake, or on the banks, and strayed sheep are frequently killed by the vapour." The gaseous products of these lakes, as ascertained by proficient chemists, are, 1. Carbonic acid gas; 2. Sulphuretted hydrogen gas; 3. Sulphureous acid gas; and, 4. Carburetted hydrogen gas. About one hundred and fifty yards from the lake, is a small stream of running water, in which, for the space of about ten yards, is a place called "The Vado Mortale," where is also a bubbling of carbonic acid gas, with a mixture of sulphureous acid gas in the stream itself. There are some other places besides those mentioned, where carbonic acid is constantly escaping; from all which we may draw the conclusion, that this is a very dangerous neighbourhood. One circumstance remains to be stated regarding the lake, namely, that with a constant stream rushing into it, and perhaps a supply from below, with the rising gas, there is no apparent exit, except when it overflows during the season of rain. But this is by no means singular, as all acquainted with physical geography know full well.

Mr Loudon offers no opinion as to what causes death in the Valley of Poison which he describes. But we have little hesitation in saying, that it is carbonic acid gas, which, escaping through some fissures in the ground, collects in a large body at the bottom of the valley; carbonic acid being much heavier than common air, settles near the surface of the earth, as we find in the case of the Neapolitan lakes. This gas, probably mixed with other gases, as in the instances referred to, is in all likelihood set free by volcanic action going on under ground, but with an intensity less than that which produces an eruption. This is supposed to be the case at Naples; for although there is no appearance of volcanic products in the surrounding district, yet all the world knows that this is a volcanic country. Vesuvius is close at hand, and, as is well known, is in a state of frequent activity. Some parts of Java are in a state of almost constant volcanic activity, there being several hot wells, mud volcanoes, and places where vapour is constantly emitted. One of these mud and vapour volcanoes has been well described by Dr Horsfield, in his account of Java; and as its attendant phenomena bear a considerable resemblance to those exhibited by the lake Amsanctus, we make an extract from his description. "About the centre of this limestone district, is found an extraordinary volcanic phenomenon. On approaching it from a distance, it is first discovered by a large volume of smoke rising and disappearing at intervals of a few seconds, resembling the vapours arising from a violent surf. A dull noise is heard, like that of distant thunder. Having advanced so near that the vision was no longer impeded by the smoke, a large hemispherical mass was observed, consisting of black earth, mixed with water, about sixteen feet in diameter, rising to the height of twenty or thirty feet, in a perfectly regular manner, and, as it were, pushed up by a force beneath; which suddenly exploded with a dull noise, and scattered about a volume of black mud in every direction. After an interval of two or three, or sometimes four or five seconds, the hemispherical body of mud or earth rose and exploded again. In the same manner, this volcanic ebullition goes on without interruption, throwing up a globular body of mud, and dispersing it with violence through the neighbouring plain." Farther on, we are told that "a strong, pungent, sulphureous smell, somewhat resembling that of earth-oil, is perceived on standing near the explosion; and the mud recently thrown up possesses a degree of heat greater than that of the surrounding atmosphere. It owes its origin to the general cause of the numerous volcanic eruptions which occur on the island."

We must briefly advert to the coincidences between the two phenomena. They both occur in districts where lime is present, it would appear, in abundance, in combination both with carbonic acid and with sulphuric acid. By internal heat these are disengaged from the lime with which they are combined, and of course seek a vent and rise to the surface of the ground. Sulphuretted and carburetted hydrogen are gases often formed in the bowels of the earth by the agency of heat, in connection with other causes, and emitted in certain localities. They make their escape at the Lago di Amsanctus, and in all probability at the mud volcanoes of Java. But this is an immaterial point. Whether carbonic acid gas be present in the Java case, we know not, as Dr Horsfield is silent upon the subject; he does not appear to have made any experiments with animals, so that the evidence is negative. It may be present, as in the Neapolitan instance, and very likely it is so. In both cases the vapours

make their escape with a noise resembling "distant thunder," such is the descriptive phrase employed by both writers. The water of the one, and the mud of the other, is coloured black by the action of sulphureous acid gas upon the earthy matter. This is the only one of the gases mentioned which is visible to the eye as a vapour; carbonic acid, sulphuretted hydrogen and carburetted hydrogen gases, being all colourless, so that Mr Hamilton is in error when he says that the undulating masses which are visible at some hundred yards' distance are carbonic acid. The vapour is certainly sulphureous acid gas, but having the others mixed with it of course. Dr Horsfield expressly states that when standing "near the explosion" he felt a "strong, pungent, sulphureous smell." Did our limits permit, we might point out other coincidences, but we have shown enough to warrant the conclusion, that the phenomena are of the same description, and produced by the same cause.

There being no vapour seen in the Valley of Poison, is neither for nor against the supposition that carbonic acid is the cause of death to animals, because it is a colourless gas, and may be present in great quantity without being visible. Our object in bringing forward the case of the mud volcano, is to prove that at least one of the gases discharged from the Neapolitan lake is also emitted by it, and that, as in the first instance, the same cause likewise sets free carbonic acid, so in the second it may do the same, although the latter gas issues in another locality, and unaccompanied by visible vapour. There is no necessity for the contemporaneous existence of all the gases in either instance; and the one which appears in the shape of smoke, namely, sulphureous acid gas, may therefore be absent in the case of the Valley of Death.

Lastly, we may observe, that carbonic acid is the gas which is so destructive to the lives of those shut up with burning charcoal, and which is also found in brewers' vats, in cellars, wells, drains, graves, and other places which have been long unopened, and into which it may prove fatal to descend until they are ventilated. Carbonic acid in a more harmless shape gives its effervescing quality to the humble beverage, soda water. Thus, by a coincidence by no means singular in nature, does the same gas afford a mortal poison, and a luxurious refreshment. It has lately been reduced to a solid state in a very ingenious manner by Mr T. K. Kemp, chemist in Edinburgh. It is not, therefore, at all unlikely that in this condensed form carbonic acid may yet prove very useful in the arts and in medicine.

MOTTOS.

The observation of an extremely happy and humorous motto, in a most unlooked-for place, has called our attention to this subject. No man of woman born, who ever lights gas or candle, or seals a letter, needs now-a-days to be told what a Lucifer match is. One of the numerous vendors of this article about the British metropolis, desirous of announcing emphatically the great reduction which he had made in its price, has placed in his window the following inscription, in large letters—"Oh, Lucifer, how art thou fallen! only one penny a-box!" Doubtless, a considerable increase in sale has been the consequence of this clever hit, and the man deserved it. In the matter of books, also, a well-selected motto is a thing not altogether unimportant. The sight of it, on a title-page, leads one to anticipate good stuff within.

The famous contest between Byron and the Rev. W. Lisle Bowles, respecting the question of Pope's poetical genius and character, brought out nothing better, in its whole progress, than the mottos respectively affixed by the combatants to their lucubrations. Byron's attack on his clerical contemporary had this bold line on its title page: "I will play at Bowls." Bowles, with equal point and greater courtesy, replied with the inscription, "He that plays at Bowls must expect Rubbers." These prefatory "pellets of wit" were worthy of the men, and of their high argument. One of the happiest mottos ever hit on, perhaps, was that with which Sir Walter Scott opened his confessions and revelations, at the commencement of his new edition of the Waverley Novels. There is consummate modesty in it—

And must I ravel out
My weaved-up follies?—Richard II. Act IV.

The motto which long headed the pages of the Examiner newspaper, was very generally admired for its force and point—

Party is the madness of many, for the gain of a few.

The same writer (Leigh Hunt) who in all probability selected the preceding motto, has a very appropriate and characteristic one on the title-page of his Indicator, a series of light periodical essays, to the discursive nature of which the subjoined lines are particularly applicable—

There he arriving round about doth sit,
And takes survey with bume, curious eye:
Now this, now that, he teacheth sundrily.

Samuel Johnson defines a motto to be "a sentence or word prefixed to any thing written, or added to a device." The latter sense of the term alludes chiefly to the words or sentences accompanying the armorial bearings of different families. Some of these are curious in more respects than one. The motto of the family of Cunningham, for example, is "Over fork over," and their arms a long fork, or instrument with which hay is thrown up to horses. Some genealogical works merely say that this motto was taken by

the family on account of their having at one time the mastership of the king's stables and horses. But its true origin is much more interesting than this account would make it. One of our old Scottish kings, being pursued by enemies, and in mortal peril, took refuge in the house of a Cunningham, or at all events of the ancestor of the Cunninghams. This person was loyal to his king, and concealed him beneath some hay or straw, while he busied himself in forking over when the monarch's foes came to the place. The seemingly natural and ordinary character of the occupation deceived the hunters, and the king was saved. In gratitude for the deed, he afterwards bestowed lands on his preserver, and gave him the commemorative armorial bearings, which his descendants, the Cunninghams, still bear.

Some of the mottoes of the peerage are remarkable as containing puns on the names of the families who have chosen them. Some of these plays on words are good, others detestably bad. The family motto of the Vernons is one of the best: "Ver non semper viret," which may either be read "Vernon always flourishes," or "Spring does not always flourish," in which latter truism, it must be allowed, there is little appropriateness, unless, indeed, we hold it as a warning to "make hay while the sun shines." Perhaps a better motto of this species is that which the noble family of Onslow have selected. This is "Festina lente," an old Latin proverb, signifying "on slow," or "hasten slowly," an advice at once to progress, and a caution at the same time to beware of imprudent haste. The Scottish Barons Fairfax have a pithy quibble for their family motto; namely, "Fare fac," which, being translated, signifies "Speak, do." This is not very happy, as it has been generally held a better rule "faire sans dire," "to act without much talking," which is the motto of the Fox family. The motto of the Nevilles is another of these punning devices, and is a tolerable one on the whole. "Ne vile velis," "Incline to nothing base." Very similar is the motto of the Fanes Earls of Westmoreland, which runs thus, "Ne vile fano," "Bring nothing base to the fane," or temple. The dual house of Cavendish has the words "Cavendo tutus," signifying "Safe by caution," as its motto. All these are respectable quibbles enough in their way, but as much cannot be properly said for the succeeding ones. "Forte scutum salus ducum" is a piece of bad Latin, intended to express that a "strong shield is the safety of commanders," and embodying in its first syllables the name of Fortescue, of which family it is the motto. Another of the same kind is that of the noble Irish family of Maynard: "Manus justa nardus," "The just hand is a precious ointment." This is too obviously a manufacture for a purpose, and but for the poor pun involved, could have been taken by nobody as a motto. Worse rather than better is the device of the Barons Henniker, whose family name is Major. "Deus major columna," "God is the great support," are the words in question. With a little more skill, though at the cost of employing an obsolete Latin word, the family of Aston have contrived to get their name nearly hitched into a line of a decent kind as regards sense. Their motto is, "Numini et patrie asto," "I stand to God and my country." But the greatest degree of vanity, and the weakest invention exhibited in this way, occur in the case of the Temples, or at least the Buckingham branch of that family. "Templa quam dilecta," in English, "Temples, how beloved," is the sentence alluded to. The second meaning, or *double entendre*, is nothing else than, "What an amiable family the Temples are!" From such armorial mottoes as these, it is a pleasure to turn to that now borne by the line of Bruce, once royal and yet noble. A single word forms their dignified and pathetic motto, "Fuimus," "We have been." Volumes could not tell more emphatically the history of the house.

One of the most apt and perfect of all witty mottoes, was that suggested by Henry Erskine for the family arms of Gillespie, the founder of Gillespie's Hospital at Edinburgh, and who had made a fortune by dealings in snuff. The lines

Who could have thought it,
That noses had bought it?

were those proposed by the witty lawyer, but Mr Gillespie did not, we fear, adorn his carriage with them, though, for the credit of his sense, it is to be hoped he enjoyed their humour. For the present, we leave the subject of mottoes. On falling in with a few more of a curious kind, we may return to it.

IRISH WIT AND HUMOUR.

The poverty of the Irish is not exaggerated—neither is their wit—nor their good humour—nor their whimsical absurdity—nor their courage. WIT—I gave a fellow a shilling on some occasion when sixpence was the fee! "Remember you owe me sixpence, Pat!" "May your honour live till I pay you!" There was courtesy as well as art in this, and all the clothes on Pat's back would have been dearly bought by the sum in question. HUMOUR—There is perpetual kindness in the Irish cabin; butter milk, potatoes; a stool is offered, or a stone is rolled that your honour may sit down and be out of the smoke, and those who beg every where else seem desirous to exercise free hospitality in their own houses. Their natural disposition is turned to gaiety and happiness; while a Scotchman is thinking about the term day, or, if easy on that subject, about hell in the next world; while an Englishman is making a little hell in the present, because his mufin is not well roasted—Pat's mind is always turned to fun and ridicule. They are terribly excitable to be sure, and will murder you on slight suspicion, and

find out next day that it was all a mistake, and that it was not yourself they meant to kill at all at all.—*The Genius and Wisdom of Sir Walter Scott.*

SCOTT'S ADVICE TO HIS SON.

Read, my dear Charles, that which is most useful. Man only differs from birds and beasts because he has the means of availing himself of the knowledge acquired by his predecessors. The swallow builds the same nest which its father and mother built, and the sparrow does not improve by the experience of its parents. The son of the learned pig, if it had one, would be a mere brute, fit only to make bacon of. It is not so with the human race. Our ancestors lived in caves and wigwags, where we construct palaces for the rich, and comfortable dwellings for the poor; and why is this?—but because our eye is enabled to look back upon the past, to improve upon our ancestors' improvements, and to avoid their errors. This can only be done by studying history, and comparing it with passing events.—*The same.*

WEEDS.

BY J. F. SMITH.

Scorn not those rude, unlovely things,
All cultureless that grow;
And rank o'er woods, and wilds, and springs,
Their vain luxuriance throw.
Eternal love and wisdom drew
The plan of earth and skies;
And He, the span of heaven that threw,
Commands the weeds to rise.
Then think not nature's scheme sublime
These common things might spare:—
For science may detect in time
A thousand virtues there.

BRUMMELIANA.

THE celebrated Beau Brummel was the subject of a short paper in the Journal, No. 297. To the memorabilia of him, there recorded, the following, from a publication of past date, entitled the Literary Pocket-Book, form an appropriate addition:—

Having taken it into his head, at one time, to eat no vegetables, and being asked by a lady if he had never eaten any in his life, he said, "Yes, madam; I once ate a pea."

Being met limping in Bond Street, and asked what was the matter, he said he had hurt his leg, and "that the worst of it was, it was his favourite leg."

Somebody inquiring where he was going to dine next day, was told that he really did not know: "they put me in a coach and take me somewhere."

He pronounced of a fashionable tailor that he made a good coat, an exceedingly good coat, all but the collar: nobody could achieve a good collar but Jenkins.

Having borrowed some money of a city beau, whom he patronised in return, he was one day asked to repay it; upon which he thus complained to a friend: "Do you know what has happened?" "No." "Why, do you know, there's that fellow Tomkins, who lent me five hundred pounds; he has had the face to ask me for it; and yet I had called the dog 'Tom,' and let myself dine with him."

"You have a cold, Mr Brummel," observed a sympathising group. "Why, do you know," said he, "that on the Brighton road, the other day, that infidel Weston (his valet) put me into a room with a damp stranger."

Being asked if he liked port, he said, with an air of difficult recollection, "Port? Port?—Oh, port!—Oh, ay; what, the hot intoxicating liquor so much drunk by the lower orders?"

Going to a rout, where he had not been invited, or rather, perhaps, where the host wished to mortify him, and attempted it, he turned placidly round to him, and, with a happy mixture of indifference and surprise, asked him his name. "Johnson," was the answer. "Jaulnson," said Brummel, recollecting, and pretending to feel for a card; "Oh, the name, I remember, was Thaumson (Thompson); and Jaulnson and Thaumson, you know, Jaulnson and Thaumson, are really so much the same kind of thing!"

A beggar petitioned him for charity, even if it was only a farthing: "Fellow," said Mr Brummel, softening the disdain of the appellation in the gentleness of his tone, "I don't know the coin."

Having thought himself invited to somebody's country seat, and being given to understand, after one night's lodging, that he was in error, he told an unconscious friend in town, who asked him what sort of a place it was, that it was an "exceedingly good place for stopping one night in."

Speaking lightly of a man, and wishing to convey his maximum of contemptuous feeling about him, he said, "He is a fellow, now, that would send his plate up twice for soup."

It being supposed that he once failed in a matrimonial speculation, somebody condoled with him; upon which he smiled, with an air of better knowledge on that point, and said, with a sort of indifferent feel of his neckcloth, "Why, sir, the truth is, I had great reluctance in cutting the connection; but what could I do? (Here he looked deploring and conclusive.) Sir, I discovered that the wretch positively ate cabbage."

On being asked by a friend, during an unseasonable summer, if he had ever seen such a one? "Yes," replied Brummel, "last winter."

On a reference being made to him as to what sum would be sufficient to meet the annual expenditure for clothes, he said, "that with a moderate degree of prudence and economy, he thought it might be managed for eight hundred per annum."

He told a friend that he was reforming his way of life. "For instance," said he, "I sup early; I take a-a-little lobster, an apricot puff, or so, and some burnt champagne, about twelve; and my man gets me to bed by three."

ECONOMY OF A SCOTCH FARM.

The Scotch system of farming having been frequently praised for its superiority, the following statements relating to a farm in the county of Haddington may not be uninteresting to our agricultural readers. The account is collected from the evidence of Mr Brodie, the occupier, and may be seen at length in the third report of the select committee appointed to inquire into the state of agriculture. The farm consists of 500 acres, cultivated according to the following rotation:—The first is fallow and barley; the next wheat, and perhaps a little barley after the turnips; the third is pastured grass; the fourth is oats; the fifth is drilled peas and beans, mixed in proportion of four bushels of beans to one of peas; and the potatoes are generally planted upon a portion of this break, upon the dry land. Very little hay is cut, from 12 to 20 acres; a small portion of grass is raised off, to cut green for the horses; and in winter they are fed on straw of the beans and peas, which is very nutritious when well got. The farm is divided into six breaks, as nearly equal as possible. The first year, 40 acres in one of the breaks may be a fallow. In the next year, all that has been summer fallowed, is sown with wheat, and in a good season, part of the land which was sown on turnips is sown with wheat, and if not with wheat, with barley. Two-thirds of it is in wheat, and the remainder in barley. There are about 80 acres of grass altogether. Barley has been tried after grass, but has not answered. The oats are about 80 acres, and are not got in with once ploughing. Fallow is sown with wheat about the end of September, and the bean land as soon after that as possible. If the land is dry and in good order, it is sown any time before the end of November. The produce per acre is as follows—Wheat 3 qrs. 5 bushels; oats 6 qrs.; barley 5 qrs. 3 bushels; beans 3 qrs. 2 bushels; potatoes 34 bushels. A pair of horses is kept for every 62½ acres. The poor-rates amount to L.10, and are equally divided between the landlord and the tenant.—*Newspaper paragraph.*

CIGAR MANUFACTURE.

The manufactory of Malaga employs 700 persons (women and children) in making cigars. A good pair of hands at the work may furnish three hundred a-day; but (as the children cannot make half that number) taking the average at two hundred, gives a daily supply of 140,000. The manufactory of Seville employs 1000 men, and 1600 women. These 2600 persons may be calculated as furnishing, on an average, 250 each per diem; or, altogether, 650,000. Add to this number the 140,000 made at Malaga, and we have 790,000 as the "total of the whole" manufactured daily in Spain. The persons employed in the manufactory of cigars are paid at the rate of one real vellon for fifty, which enables even a first-rate maker to earn but fifteenpence a-day. The best cigars are made entirely of Havana tobacco, and are sold at the factory at the rate of thirty real vellons a-hundred, or about three farthings English each. The second quality, composed of mixed tobacco (that is, the interior of Havana leaf, and the outside of Virginia), cost eighteen real vellons per hundred, or something under a halfpenny each. It may be seen, from this statement of the cost of cigars of the royal manufactory, that smuggling cannot but prosper; since, at the Havana, the very best cigars are sold for twelve dollars a-thousand (or a trifle above a halfpenny each), whilst those of inferior quality may be had for one-fourth that price.—*Captain Scott's Excursions in Spain.*

REGULATION OF DIET.

Many shut themselves up entirely, in unpleasant weather, during the long winter, or whenever they find a pressure of business within, or unpleasant weather without; and yet they eat just as voraciously as if they took exercise every day. To say that no attention is to be paid to diet, is madness. You must pay attention to it sooner or later. If you are faithful to take regular, vigorous exercise every day in the open air, then you may eat, and pay less attention to quantity and quality. But if you take but little exercise, you may be sure that you are to be a severe sufferer if you do not take food in the same proportion. I do not ask you to diet, that is, to be as difficult, and as changeable, and as whimsical, as possible, as if the great point were to see how much you can torment yourself and others; but I do ask you to beware as to the quantity of food which you hurry into the stomach three times each day, without giving it any rest. It is the quantity, rather than the kinds of food, which destroys sedentary persons; and it is certainly true that the more simple the food, the better. If you are unusually hurried this week; if it storms to-day, so that, in these periods, you cannot go out and take exercise, let your diet be very sparing, though the temptation to do otherwise will be very strong. When by any means you have been injured by your food, have overstepped the proper limits as to eating, I have found, in such cases, that the most perfect way to recover is to abstain entirely from food for three or six meals. By this time the stomach will be free, and the system be restored. I took the hint from seeing an idiot who sometimes had turns of being unwell; at such times he abstained entirely from food for about three days, in which time nature recovered herself, and he was well. This will frequently, and perhaps generally, answer instead of medicine, and is every way more pleasant. The most distinguished physicians have ever recommended this course. It is a part of the Mahomedan and Pagan systems of religion, that the body should be recruited by frequent fastings. Let a bull-dog be fed in his infancy upon pap, Naples biscuit, and boiled chicken; let him be wrapped in flannel at night, sleep on a good feather bed, and ride out in a coach for an airing; and if his posterity do not become short-limbed, puny, and valetudinarian, it will be a wonder.—*Todd's Student's Manual.*

THE HEROINES OF BURNS.

SECOND ARTICLE.

It has been said that the visit of Burns to Edinburgh in the winter of 1787-8, opened up a new world to him. One peculiar novelty to which it introduced him was the society of elegant and accomplished women. Such a phenomenon had not previously crossed his path, and it was one calculated to make a deep impression on him. He regarded them with as much admiration as he had previously bestowed on the homely maidens of Kyle, but it was an admiration in which reverence was mingled. His address to them was extremely deferential—so we are informed by Sir Walter Scott—and "always with a turn to the pathetic or humorous which engaged their attention particularly." Another witness, herself a lady moving in the highest walk of life—the late Duchess of Gordon—described the power of his conversation with persons of her stamp by the Scottish phrase, that "nothing ever had carried her so completely off her feet." Amongst the first gentlewomen with whom he formed any friendship, were Miss Margaret Chalmers and Miss Catherine Hamilton, the latter being sister to his friend Mr Gavin Hamilton of Mauchline. A relationship between the two ladies had ripened into a warm attachment, and Burns seems to have always regarded them as a binity of female loveliness and worth, rather than as two persons. An elder sister of Miss Chalmers, by name Lady Mackenzie, added an equally agreeable third to the group. We get an affecting insight into the pleasure which their society conferred on him, from a passage in a letter written by him to Miss Chalmers, after he had retired to the country, to resume his life of obscure toil—"When I think of you—hearts the best, minds the noblest of human kind—unfortunate even in the shades of life, when I think I have met with you, and have lived more of real life with you in eight days than I can do with almost any body I meet with in eight years—when I think on the improbability of meeting you in this world again—I could sit down and cry like a child!" He never did see any of them again.

During the autumn of 1787, being engaged in writing songs for Johnson's Scottish Musical Museum,* he resolved to canonise Miss Hamilton and Miss Chalmers. Upon the former—whom he has in prose described as "not only beautiful, but lovely," of "an elegant form," features not regular, but invested with "the smile of sweetness and the settled complacency of good nature," and "a complexion equal to Miss Burnett's"†—upon her he wrote his song "How pleasant the banks of the clear winding Devon," in which occurs the following exquisite stanza:—

"Mild be the sun on this sweet blushing flower,
In the gay rosy morn, as it bathes in the dew!
And gentle the fall of the soft vernal shower,
That steals on the evening each leaf to renew."

Miss Chalmers, on the other hand, was the Peggy of

his song beginning "Where braving winter's angry storms," and of another beginning "My Peggy's form, my Peggy's face," in which last he chiefly insists on the mental beauties of the heroine—

"The lily's hue, the rose's dye,
The kindling lustre of an eye;
Who but owns their magic sway!
Who but knows they all decay!
The tender thrill, the pitying tear,
The generous purpose, nobly dear,
The gentle look, that rage disarms—
These are all immortal charms."

Miss Chalmers was married in the ensuing year to a gentleman named Hay, and we are given to understand that she still lives, at Pau, in the Pyrenean district of Berne. Miss Hamilton, two or three years later, became the wife of Dr Adair, of Harrowgate, a gentleman whom Burns had been the means of introducing to her; she has long been gone to the land of the generous and faithful.

The year 1787 was drawing to a close, and Burns was contemplating an immediate departure from Edinburgh, when, drinking tea one evening at the house of a Miss Nimmo, in Alison Square, he met a young married lady, named Mrs Agnes Craig or McLehose, who was destined to be one of the most distinguished of all his many heroines. This lady was, by birth, connected with some of the most eminent literary and philosophical persons who flourished in Scotland during the last century. Her paternal grandfather was the Rev. John MacLaurin, one of the ministers of Glasgow, and author of a volume of sermons, one of which, in particular, has been in high repute for a century, as a model of evangelical piety and pulpit eloquence. Colin MacLaurin, the eminent mathematician, and friend of Newton, was brother to this gentleman, and consequently granduncle to our heroine. Mrs McLehose was also cousin to the Hon. William Craig, a judge of the supreme civil and criminal courts in Scotland, and further distinguished as one of the principal writers in the *Mirror and Lounger*, the last of the brilliant line of the British Essayists. The lady was beautiful, possessing in particular very fine dark eyes, and her conversation was remarkable for an intelligent sprightliness and naïveté, though expressed in the phraseology and accent of her native country. Her matrimonial connection had proved, from no fault on her part, unhappy, and she now resided in Edinburgh, with two young children, while her husband pushed his fortune in Jamaica, where he ultimately became chief clerk of the Court of Common Pleas, and died in 1812. It was impossible for two minds, such as those of Burns and Mrs McLehose, constituted alike with superior intellect, and ardent feelings, to meet without being mutually pleased, and becoming in some degree mutually attached. The lady, from her high admiration of his poems, had long wished to know the bard; and when she left the house, Miss Nimmo did not fail to rally the poet on the impression which had evidently been made upon him. Burns, with the prospect before him of quitting Edinburgh in eight days, probably for years, could only express his regret that he had not made the acquaintance earlier. We learn from the series of letters which he addressed to the lady, that he had expected again to meet her after an interval of two days, but on that day met with an unlucky accident, a bruised limb from the fall of a coach, by which he was prevented from attending to his appointment. The accident, confining him to his room for several weeks in Edinburgh, gave him an opportunity of cultivating the friendship of Mrs McLehose by correspondence. After writing two or

three letters to him with her usual signature, in answer to one of his, she, in the spirit of romance, took the name of Clarinda, and he immediately followed up the idea by assuming that of Sylvander, as suitable to his rustic education. The fact that she also had some share of the poetical gift was soon made known to him, and on his enclosing for her some of his recent attempts in verse, she returned the compliment by sending him a little poetical effusion, the first of her efforts in that way, which she had some years before, while living at Burntsfield Links, composed on hearing a blackbird singing near what is now St Margaret's Convent in that neighbourhood, the ideas, to use her own words, coming into her mind like inspiration: they are as follow:—

"Go on, sweet bird, and soothe my care,
Thy tuneful notes will hush despair;
Thy plaintive warblings, void of art,
Thrill sweetly through my aching heart.
Now chuse thy mate and fondly love,
And all the thrilling transport prove;
While I a love-lorn exile live,
Nor transport or receive or give.

For thee is laughing Nature gay,
For thee she pours the vernal day;
For me in vain is nature drear,
While joy is stranger to my breast!
These sweet emotions all enjoy;
Let love and song thy hours employ!
Go on, sweet bird, and soothe my care,
Thy tuneful notes will hush despair."

Burns, in reply, complimented her on her "fine taste and turn for poesy," and mentioned that Dr Gregory, to whom he had shown the verses, could scarcely be persuaded that they were the composition of a young unknown female. He, in the same letter, spoke of love, such love as genial souls of whatever sex can feel for each other—described himself as a will-o'-wisp being, composed of pride and passion, but too little of a calculator to be capable of forming a design against her—and added what follows:—"Tis true I never saw you but once; but how much acquaintance did I form with you in that once! Of all God's creatures I ever could approach in the beaten way of my acquaintance, you struck me with the deepest, the strongest, and most permanent impression. I say the most permanent, because I know myself well, and how far I can promise either on my prepossessions or powers. Why are you unhappy, and why are so many of our fellow-creatures, unworthy to belong to the same species with you, blest with all they can wish? You have a hand all benevolent to give: why were you denied the pleasure? You have a heart formed—gloriously formed—for all the most refined feelings: why was that heart ever wrong! Oh, Clarinda, shall we not meet in a state, some yet unknown state of being, where the lavish hand of plenty shall minister to the highest wish of benevolence! * * * * If we do not, man was made in vain."

The word love used in this letter distressed the pure mind of Clarinda, and in her answer she enclosed the following verses—

"Talk not of Love, it gives me pain,
For Love has been my foe;
He bound me with an iron chain,
And plunged me deep in woe.

But Friendship's pure and lasting joys
My heart was formed to prove;
There, welcome, win and wear the prize,
But never talk of Love."

The poet proved to be highly pleased with this epigram, the third and fourth lines of which he considered

* We are glad to learn that this valuable repertory of Scottish music and song is about to be republished by Messrs Blackwood, with a volume of extremely interesting notes by the late Mr W. Stenhouse, and some additions to these by Mr David Laing.

† Eliza Burnett, youngest daughter of the learned and eccentric Lord Monboddo, was celebrated by Burns in his "Address to Edinburgh," but she scarcely ranks as one of his heroines, not being the subject of any distinct song from his pen. Of her exquisite beauty a faithful and very pleasing representation is given in a work now in course of publication, entitled "The Land of Burns." She died of consumption in June 1790.

worthy of Sappho; and he added the two following verses in accordance with the strain of her letter:—

“Your friendship much can make me blest,
Oh, why that bliss destroy?
Why urge the only one request
You know I must deny?
Your thought, if love must harbour there,
Conceal it in that thought;
Nor cause me from my bosom tear
The very friend I sought.”

And he caused both the former and this poem to be inserted, in connection with proper music, in Johnson's Museum.

The correspondence went on for several weeks, during the confinement of the poet, who, after the first interview at Miss Nimmo's, never saw Clarinda all that time. At length he so far recovered as to be able to walk abroad, and the first use he made of his regained strength was to call for Clarinda. The letters of the poet show how keenly he enjoyed the conversation of the lady on this and similar occasions, during the very short time which he was able to spend in Edinburgh. He then saw, to use his own enthusiastic language, “a bosom glowing with honour and benevolence; a mind ennobled by genius, informed and refined by education and reflection, and exalted by native religion, genuine as the climes of heaven; a heart formed for all the glorious meltings of friendship, love, and pity.” Again he tells her, “You have stolen away my soul, but you have refined, you have exalted it: you have given it a stronger sense of virtue, and a stronger relish for piety.” Then he pours forth a train of fervent aspirations. He desires to have “the social heart that kindly tastes of every man's cup. Is it a draught of joy? be my heart warm and open to share it with cordial unenvying rejoicing! Is it the bitter potion of sorrow? be my heart melted with sympathetic woe! Above all, may I have the manly mind that resolutely exemplifies, in life and manners, those sentiments which I would wish to be thought to possess! The friend of my soul—there may I never deviate from the firmest fidelity and most active kindness! Clarinda, the dear object of my fondest love—there may the most sacred inviolate honour, the most faithful kindling constancy, ever watch and animate my every thought and imagination!” The whole strain of the letters is one of enthusiastic admiration and attachment, mingled with the bitterest bewailings of that fortune which had condemned them to a speedy and probably unending separation.

He left Edinburgh in February (1788), after addressing her in the four well-known stanzas beginning

“Clarinda, mistress of my soul.”

He was soon after married, and from that time no further correspondence took place between them until the end of 1791, when, learning that the lady was about to proceed to Jamaica on the invitation of her husband, who had become very prosperous, he, with his wonted enthusiasm, and a strong impression on his mind that they might never meet again, which was realised, sent three beautiful and now well-known lyrics (all of which, he said, were to be set to favourite old Scots tunes) addressed to his friend, beginning “Ance mair I hail thee, thou gloomy December,” “Behold the hour, the boat arrive”—and the following stanzas:—

“Ae fond kiss, and then we sever;
Ae fareweel, and then for ever!
Deep in heart-wrung tears I'll pledge thee,
Warring sighs and groans I'll wage thee.
Who shall say that Fortune grieves him,
While the star of hope he leaves him?
Me, nae cheerful twinkle lights me;
Dark despair around benights me!
I'll ne'er blame my partial fancy,
Naething could resist my Nancy!
But to see her, was to love her;
Love but her, and love for ever.
Had we never loved sae kindly,
Had we never loved sae blindly,
Never met—or never parted,
We had ne'er been broken-hearted.
Fare-thee-weel, thou first and fairest!
Fare-thee-weel, thou best and dearest!
Thine be ilka joy and treasure,
Peace, Enjoyment, Love, and Pleasure!
Ae fond kiss, and then we sever!
Ae fareweel, alas, for ever!
Deep in heart-wrung tears I'll pledge thee,
Warring sighs and groans I'll wage thee.”

The fourth stanza Byron put at the head of his poem

of the Bride of Abydos; Scott has remarked that it is worth a thousand romances; and Mrs Jameson has elegantly remarked that not only are these lines what Scott says, but “in themselves a complete romance. They are,” she adds, “the *alpha and omega* of feeling, and contain the essence of an existence of pain and pleasure, distilled into one burning drop.” In the last letter of the printed collection, dated in 1793, after her return from abroad, which she was compelled to do by extreme bad health, he says, “Before you ask me why I have not written you, first let me be informed *how* I shall write you? ‘In friendship,’ you say; and I have many a time taken up my pen to try an epistle of friendship to you. But it will not do. ‘Tis like Jove grasping a pop-gun, after having wielded his thunder. When I take up the pen, recollection ruins me. Ah! my ever dearest Clarinda! Clarinda!—What an host of Memory's tenderest offspring crowd on my fancy at that sound! But I must not indulge the subject—you have forbid it.” He also tells her, that, when called on in social companies to name a married lady as a toast, her name in an abbreviated form is that which he invariably presents. And so concludes the history of Sylvander and Clarinda.*

A few other ladies attracted the poetical admiration of Burns during the Edinburgh period of his life. On Miss Ann Masterton, he wrote—

“Ye gallants bright, I rede ye right,
Beware o' bonnie Ann,
Her comely face sae fu' o' grace,
Your hearts she will trepan.
Her een sae bright, like stars by night,” &c.

She was daughter of the Allan of his song, “Here are we met, three merry boys”—a teacher of writing in Edinburgh, and the clever composer of several Scottish airs, of which that to the above song is a favourable specimen. The lady married a gentleman of the name of Derbyshire, and now resides in London. Another teacher, Mr William Cruickshanks, of the High School, was an endeared friend of the poet, and in his house Burns lived at the time when he carried on the above described correspondence. Mr Cruickshanks had a daughter, a beautiful girl of twelve or fourteen, who was then beginning to play on the piano-forte, with which instrument she often regaled the bard. He marked his sense of the blossoming loveliness and fine musical talent of this young creature, by composing his delightful song,

“A rose-bud by my early walk
Adown a corn-enclosed bank,
Sae gently bent its thorny stalk,
All on a dewy morning,” &c.

Never, perhaps, was a poetical compliment to *one* so tolerable to the many as in this fine composition. She who stands thus in poetry's celestial globe, became, in prose's terrestrial one, the wife of a gentleman named Henderson, a legal practitioner in Jedburgh; and, if we are not mistaken, she still inhabits our nether sphere. To conclude the heroines of this period, it is only necessary to allude to a lady whom he met in the summer of 1787 at Auchtertyre, the seat of Sir William Murray in Perthshire—Miss Euphemia Murray by name, but more generally called, on account of her personal charms, the *Flower of Strathmore*. Delighted with the conversation of this amiable young lady, he wrote, with reference to her,

“By Auchtertyre grows the aik,
On Yarrow banks the birken shaw;
But Phemie was a bonnier lass
Than braes o' Yarrow ever saw.
Her looks were like a flower in May,
Her smile was like a summer morn;
She tripped by the banks o' Earn,
As light's a bird upon a thorn.
Her bonnie face, it was as meek
As any lamb upon a lea;
The evening sun was ne'er sae sweet,
As was the blink o' Phemie's ee.”

* This most interesting woman still lives, but has long been in, rather than of, the world, as befits her advanced age and infirmities. The letters which Burns addressed to her were published surreptitiously, and by a gross breach of confidence on the part of a literary friend of Graham, the amiable author of “The Sabbath,” to whom they had been entrusted in March 1802. The further publication of these letters was afterwards interdicted by the Court of Session. In a law-suit between Cadell and Davies (with the concurrence of Mr Gilbert Burns), and Mr Thomas Stewart of Glasgow, the publisher. The case, which was one of some legal nicety, and was pleaded by several of the most eminent counsel then at the Scottish bar, is reported in the Faculty Collection, June 1, 1804, under the following title:—“Literary Property.—The person to whom letters are addressed has no right to publish them without the consent of the writer.” However, within the last ten or twelve years these letters have been published by various booksellers both in Scotland and England, in their editions of the works of Burns.

This lady also still lives, the widow of the late Lord Methven, a judge of the supreme civil court of Scotland.

The heroines of the Dumfriesshire period of Burns's life will form the subject of the next (the concluding) paper.

POPULAR INFORMATION ON SCIENCE.

THE COLOUR OF THE OCEAN.

THE true and proper colour of water generally, and more especially of the water of the ocean, is a problem which has not been definitively settled to the satisfaction either of the learned or unlearned. It is now engaging the attention, and calling forth the talents, of many of the first philosophers of Europe, and, thus prompted and directed, we have thought it might form a suitable subject for a few observations in our pages.

We shall first adduce some of the evidence upon which it is maintained that the proper colour of water is *blue*. Our distinguished countryman Mr Scoresby compares the general tint of the Polar Seas to *ultramarine blue*; M. Cotaz, an eminent French observer, likens the water of the Mediterranean to a perfectly transparent solution of the most beautiful *indigo*; and it is by the words *bright azure* that Captain Tuckey characterises the waves of the Atlantic in equinoctial regions. Again, as to fresh water, Sir H. Davy assigns *bright blue* as the hue reflected by water procured by the melting of pure snow and ice; and Professor Hugi of Soleure thus communicates the result of his observation upon the glaciers of the Alps:—“The colour of small detached fragments of a glacier is decidedly white and clear; but if we examine a greater mass, as the thickness increases it becomes of a *blue colour*, gradually more deep; it is at first *sky-blue*, scarcely discernible, then a fine *enamel blue*, and, lastly, a very deep *azure blue*. Finally, with regard to water generally, Count Xavier de Maistre informs us that limpid waters of sufficient depth reflect, like the air, a blue colour from their interior, having, however, a darker shade, from not being intermingled [as the air] with white rays.”

These numerous and explicit statements of philosophers perfectly harmonise with the views of our practical seamen, who well know, that, in the free ocean, the water is generally of a deep blue colour *during the time of calm* (when the wind prevails, the tint changes); and such is the importance the mariner attaches to this hue, that, if it disappears, he is apt to apprehend he is approaching soundings; and shoals, reefs, and coasts, the sources of his danger, force themselves upon his awakened fears.

The cause of the generally blue colour of the deep sea has not been as yet clearly explained by philosophers; but it seems to be accounted for by reference to certain principles connected with the science of optics. Probably most are aware that light consists of the set of colours which we see so beautifully displayed in the rainbow. Now, it is a law of light, that, when it enters any body, and is either reflected or transmitted to the eye, a certain portion of it, consisting of more or less of its colours, is lost in the body. The remainder, being reflected, strikes our visual sense, and, whatever colour that may be, the object seems of that colour. Now, it chanceth that the portion of light most apt to be reflected from masses of transparent fluid is the blue; and hence it is, or supposed to be, that the air and sea both appear of this colour.

While there can be no doubt that the ocean is generally of a blue colour, it is equally certain that there are many portions of sea in which a different hue appears. The causes of these exceptions from the rule seem to be of various kinds. Frequently, the ordinary colour of the sea is affected by the admixture of foreign substances, these being sometimes of a living and organic nature, and sometimes the reverse. The most simple example of the latter class of cases is the common flooding of any stream, when quantities of mud and earthy particles are introduced into the river, and emptied into the sea. What is thus strikingly seen on every coast, on a small scale, will readily be conceived to be of infinitely wider extent in the mighty rivers of the principal continents of the globe. Thus is it with the great streams of South America, where the Plata forms a sloping bank which extends 100 miles into the Atlantic, and still more conspicuously in the mighty Amazons, with a course of 3000 miles, and a breadth at the mouth of 150 miles. Its immense body of water often rushes with a dreadful impetus and velocity into the ocean, freshening its waters to the distance of 250 miles from shore.* Hence, then, in such circumstances, the mariner, when still far from land, is not surprised when he ploughs an ocean quite of a *brownish hue*. It is from the same cause that the well-known *Yellow Sea* acquires its appearance and appropriate name. Mr Barrow estimates the quantity of yellow-coloured mud which is transmitted by the Hoan-ho or Yellow River, whose course is 2000 miles, at 2,000,000 of solid feet an hour, or 48,000,000 a-day, or 17,680,000,000 a-

* Tuckey's Mar. Geography, iv. 317.

year. "Supposing," he adds, "the mean depth of the Yellow Sea to be 120 feet, the quantity of earth brought down would, if accumulated together, be sufficient to fill up to the surface of the sea, an island of the extent of a mile square every 70 days."† The testimony of Captain Basil Hall is quite satisfactory as to the result of all this. "The water of this sea (the Yellow) over which we were sailing, was contaminated by the intermixture of mud slightly yellow in its colour. We sailed on directly across this sea for two whole days without seeing land, and gradually diminishing the depth of water, till at last we began to have some apprehension that we should fairly stick in the mud. It was soon afterwards discovered that the brig was actually sailing along with her keel in the mud, which was sufficiently indicated by a long yellow train in our wake. Some inconvenience was caused by this extreme shallowness, but there was not in reality much danger, as it was ascertained, by forcing long poles into the ground, that for many fathoms under the surface on which the sounding-lead rested, the bottom consisted of nothing but mud formed of an impalpable powder, without the least particle of sand or gravel."‡

Still more striking results arise from *living vegetables and animals*. The influence of vegetables in colouring large masses of water, may be illustrated by a reference to the Lake of Geneva, and the Red Sea. The waters of the lake usually are of a fixed pale blue colour, the delicate beauty of which arrests the admiration of every traveller. But while such is the proper colour of these waters, yet occasionally, though rarely, they are as decidedly of a green hue; and we have it upon the authority of Sir H. Davy, that on these occasions the change of colour is produced by the water being impregnated with vegetable substances. And respecting the Red Sea, let us hear the testimony of the eminent naturalist Ehrenberg. "I was for many months at Tor, on the Red Sea, near Mount Sinai. I there observed the striking phenomenon of the whole bay being of a bloody colour; the main sea, beyond the coral reef, was as usual colourless. The short waves of the calm sea carried to the shore a blood-coloured shining mass, which it deposited on the sands, so that the whole bay, fully half a league in length, at the ebb of the tide, exhibited a blood-red border more than a foot broad. This appearance was not permanent, but periodical. It attracted my attention as explanatory of the name of the Red Sea, a name hitherto of difficult explanation. Upon examination, this colour was found to be produced by one of the Algae, a marine vegetable, which M. Ehrenberg particularly described."§

The extraordinary part which *animals* play in colouring the ocean, may be demonstrated by alluding to the vast tracts of the northern sea, which among mariners are familiarly known as *green water*, and which do not, under any circumstances, assume a blue tint. Mr Scoresby thus describes them:—"After a long run through water of the common blue colour, the sea became green and less transparent. The colour was nearly grass-green, with a shade of black. Sometimes the transition between the green and blue water is progressive, passing through the intermediate shades in the space of ten or twelve miles; at others, it is so sudden that the line of separation is seen like the ripple of a current, and the two qualities of water keep apparently as distinct as the waters of a large muddy river on first entering the sea. In 1817, I fell in with such narrow stripes of various coloured water, that we passed streams of pale green, olive green, and transparent blue, in the course of ten minutes' sailing."|| These green regions extend for tens of thousands of miles, and it has been distinctly proved that the peculiar colour is produced by inconceivable multitudes of microscopic animals, principally minute sea blubber, *medusa*, and the Infusoria lately brought under the notice of our readers. Some of these animals are green, and directly produce the colour which is exhibited, but many more are yellow, which colour, combining with the blue of the sea water, will also, as every one knows, produce a green tint.

Other appearances, proceeding from a similar cause, and, if possible, still more striking, are also witnessed. Thus, a *red colour*, sometimes characterised as blood or carmine red, frequently astonishes the voyager. The water of the Gulf of California in the Northern Pacific is reddish, whence it is sometimes named the Vermilion Sea.¶ Captain Colnett, in the interesting account of his voyage, states—"That the set of the currents on the coasts of Chili, may at all times be discovered by noticing the direction of the beds of small blubber with which the coast abounds, and from which the water derives a colour like that of blood. I have often been engaged," he adds, "for a whole day in passing through various sets of them." The celebrated naturalist D'Orbigny makes similar remarks concerning the waters of the Atlantic. "There are immense tracts," says he, "off the coasts of Brazil, filled with small animals so numerous as to impart a red colour to the sea; large portions are thus highly coloured, and receive from the sailors the name of the Brazil Bank. This bank extends over a great part of the coast of that country, keeping at nearly the same distance from the shore. Another bank of the same sort occurs near

Cape Horn, in latitude 57 degrees. Captain Cook, in his third voyage, encountered the same appearances, and states, "that on examination the phenomenon was found to proceed from an infinity of little animals which, when viewed by the microscope, had the shape of cray fish of a red colour." Hence we are not to wonder, that, according to an intelligent mariner, "the southern seas sometimes presented an appearance which terrified their early navigators, who, seeing large spaces of the sea of a blood-red colour, conceived it a portent of some dreadful catastrophe." These singular appearances are not, however, confined to southern regions. At all events, Mr Scoresby narrates, that he noticed in his last voyage, in 1823, some insulated patches of *reddish-brown* water, which were found to be occasioned by animalcules; and often, too, were the icebergs and snows tinged with an *orange-yellow* stain. "The animal," he adds, "which gives this peculiar colour to the sea, is about the size of a pin's head, transparent, and marked with twelve distinct patches of a brownish colour. The same appearances have not unfrequently been noticed in fresh water; and, under the name of *blood-rain*, have sometimes caused no small alarm over wide districts. We must not on this occasion attempt to account for all these appearances, but may note, that M. Ehrenberg, in the steppes of Siberia, examined some of these waters. "In a fen," he remarks, "with a pool of water, the dark-red blood colour was very striking, even at a distance. This colour, I found on examination, was confined to the slimy surface, which in different places formed a shining skin. The red colour was darkest up the edge of the marsh. M. Chantreau, in the year 1797, examined in France a pond which exhibited the same appearances, the water being of a brilliant red colour, with a shade between cinnabar and carmine; as did Weber in Germany, near Halle, in 1790. In all these latter instances, the colour was produced by infusory animals. *Milk white* is another colour which is not unfrequently mentioned. Thus Captain Tuckey states, that, near Cape Palmas, upon the coast of Guinea, his vessel appeared to move in milk, which circumstance arose from the multitude of animals upon the surface, which obscured the natural colour of the liquid. And once more, the existence of a *yellow-coloured* sea, from the same cause is satisfactorily established. "In approaching the south point of America," says Captain Colnett, "we this forenoon passed several fields of spawn, which caused the water to bear the appearance of barley, covering the surface of a bank."

These causes of varied colour in the ocean, however striking in themselves, are not likely to mislead any one as to the inherent colour of its waters. It is different, however, with the class of causes to which we now proceed, and which we may arrange under the head of the *reflection of coloured rays from the bed or bottom of the sea*. Sometimes, indeed, though rarely, these appearances are quite as singular as any we have hitherto considered. Thus, in the Bay of Loango, the waters are almost always of a deep red colour; so much so, that they are said to be mixed with blood, and Captain Tuckey satisfied himself that the bottom is intensely red. Let us substitute for this bright red bottom one of the same shade, but obscure and slightly reflecting, and the water of the Bay of Loango would then appear of an *orange-yellow* colour. (Arago). Far more frequently, however, the bed of the sea is of a yellow rather than a red hue; and if this colour is at all bright and strong, the slight blue of the pure water will scarcely affect it, and then the waters will appear *yellow*; a tint which, let it be observed, is in fact by no means uncommon on many sea-shores. But *bright yellow* is by no means so common a tint of sea-sand as is *dull or obscure yellow*; and this, owing both to its own proper colour, and also to its being obscured by a great mass of superimposed water. When the yellow hue is thus reduced, the feeble ray reflected from the bottom, mixing with the pale blue of the ocean, produces, as is universally known, a green tint, which is communicated to the water; and this is one of the most widely spread modifying causes of change in the proper colour of the sea.

But the most difficult part of the problem still remains; and that is, to account for the green colour of the ocean in those places where it is hundreds and thousands of fathoms deep, and where, of course, every thing like reflection from the bottom is quite out of the question. In a previous column, when referring to the opinion of practical seamen, we noticed that their inference as to security, from the blue colour of the water, was limited by the condition of its being a *time of calm*. Accordingly, when the wind and waves rise, and even at other times, when the cause is not a little obscure, the colour frequently undergoes a very remarkable change, generally to a deep green. M. Arago, to account for the phenomena occurring under such circumstances, offers a theory which resolves itself into the same principle as that upon which the appearance of the green tint in shallow water was based, namely, that when the surface is troubled, the luminous rays, coming from the waves to the eye, consist more of *transmitted* rays than of *reflected* rays, and, therefore, are green. According to this view, the appearances exhibit themselves only during a breeze which disturbs the surface, and in the midst of a swell, so common over the ocean. The observer stands upon the deck of the vessel, the billows often overtopping the level of the ship; the luminous rays which reach the eye from the sea must have passed from the distant horizon through one or more of the water ridges; thus the transmitted rays have pre-

dominated over the reflected ones, and so, according to the allowed fact, must be green.

There are still a few additional facts which we should have been happy to have introduced into this discussion; but our limits forbid. M. Arago refers his speculations to the examination of those who have opportunities of actual observation, and can test their experiments by methods concerning which this is not the place to enter. In the mean while, the general reader may rest satisfied with an explanation, which accounts for the usual appearances, and which possesses much of the simplicity and verisimilitude of truth.

THE COAL-CARRIER.

A STORY.

"I GIVE you just twenty-four hours to write me a tale. A tale of some kind I must have. I must school you into authorcraft, for by that you are to live. If you do not therefore accomplish this task in the time specified, you may seek another home." Such was the unfeeling speech of Lord Arnley, a nobleman of capricious temper, to his humble dependant Charles Sevenetti. The youth, on hearing the mandate, was left alone in his little study, to consider of the bitter words which had just been uttered. He took up a quill, made it slowly into a pen, wrote his text on a sheet of paper, read it a dozen times, threw down his pen, and, equipping himself for a walk, suddenly left the house.

Lord Arnley was a man of great wealth, although, when he entered into life, he had scarcely an income adequate to the most narrow support of his hereditary baronial dignity, and had he died at the age of twenty-one, he would have left behind him such a character as many an untitled youth has bequeathed to posterity. "Economical, without meanness; generous, without prodigality; gay, without licentiousness; mild, without cowardice, with perhaps a lurking ambition which would probably have budded forth into great deeds." Such, and far more, might have been the eulogy of Lord Arnley, had he made his final exit from the stage of life, thirty-two years before the time at which our narrative commences.

But Time, the great developer of humanity, rendered a somewhat different epitaph necessary. Lord Arnley had been brought up in the country, with such habits of moderation as suited his income; but, on mingling with the world, and having his eyes opened to the luxuries of life, he was smitten with an ineradicable love of splendour. This at length seemed to tire him, and he sought new pursuits. All, however, did not bring him happiness. Something apparently had occurred to distract him; but of this there were only mysterious surmises. When all had wearied him, he one day, about two years before the date of our story, read a little story which Charles Sevenetti, an inmate of his own house, and a dependant of his family, had written for the amusement of Lady Clara. From that moment he might be said to seize upon the mind of the youth with a strange and novel voracity, seeking to explore its inmost recesses, and continually taxing his own invention for subjects whereupon the unfortunate lad should exercise his talents.

Lord Arnley had, when very young, fixed his affections on a lady of singular beauty; she preferred another, and matrimony seemed, like all the other chances of his life, destined to enrich him. A wealthier, though perhaps less lovely and less beloved dame, sought him; he married her; she presented him with Lady Clara, and in three or four years afterwards he became a widower, in which state he remained. The fair sex, after his first attachment, never seemed to form a part of his passions; his parental love, however, was intense, which, with a wandering life, and his freaks upon Charles Sevenetti, had for the two last years in some measure occupied his mind. He had now got from the extreme south of England to almost its extreme north, and there we shall leave him, in order that the unfortunate Charles may tell his tale.

At ten next night, exactly thirty-six hours after the mandate had been issued, Charles Sevenetti descended to the library of Lord Arnley. He entered; his lordship raised his head from a volume which, probably, he was not reading; Lady Clara had the flushed look of hope fulfilled, and the happy protégé, as the world termed him, cast down his eyes lest their expression should be remarked. His lordship tried to look benign, and beckoned to a seat. Charles continued standing, and said, "My lord, here is the tale; and such as it is, I have little share in it, excepting in the character of a mere narrator. Shall I have the honour of reading it, my lord?" "Assuredly; you know I never take the trouble to drag myself through manuscript." "I shall continue standing, if you please." "As you like," said Lord Arnley; "Clara, my love, it is time for you to withdraw." "May I not remain, papa?" "I had rather not," was uttered imperatively. Charles was not sorry, for he felt that the story which chance had thrown in his way, and which, under the pressure of circumstances, he had been forced to avail himself of, was not suited for her ear. "Your eyes seem in the door," said Lord Arnley. Charles started, and instantly began.

"A student was one day labouring under a severe depression of spirits. His reason told him that his mind ought to be equal in various ways to remove the load which lay upon him, but reason urged him in vain. After struggling against many contending passions, perhaps I should rather say emotions, he darted into the open air, and bent his steps to one of the

|| Arctic Regions.

¶ Tuckey, i. 24.

town suburbs. It was rather a genteel place, but yet its inhabitants were humane enough to permit a poor apple-woman to erect her little stand in their close vicinity, and a few wretched coal-porters to find a sort of shelter from the blast, by placing themselves at the end of the last house of the row. When he reached these poor creatures, he stooped to examine the eight or nine grimed faces which were before him. A little brisk woman made two or three steps in advance, as if expecting his orders. A dark gruff fellow asked where he should go to. A pair of females both started up, for some were sitting on the cold stones, and said, "We gang thegither, and carry in a load for three pence." "For three pence!" said he emphatically; "what will that do for two persons?" "Get us our breakfast, and something ower." Out of seven or eight men and women, all accosted him by word or movement, excepting an old man. This individual stood with his eyes fixed on the ground, his whole air bespeaking dejection, but no anxiety. He was of the short middle size, seemed to have been well formed, though perhaps never robust, and his features had in them a regularity and delicacy, which, even in his present condition, might be termed elegant. Broken down as he appeared to be, it was impossible to guess at his age; he looked fifty-five, but he might be only fifty.

The young man felt himself drawn towards this person as if by a magnet; his feet moved unbidden to the spot where he stood; he imagined him a man whose feelings might be as nice and acute as his own, between whose former and present situation there was perhaps as great a disparity as if he should one day be in the same state. Almost unconsciously he addressed him with, "And so, my poor old man, you are still carrying coals?" The construction of the sentence implied a former acquaintance, and the man looked up as if he expected to see some one to whom he was not a stranger.

"The man answered, 'Yes, I carry coals, sir, when any one asks me.' 'You are not fortunate, then, in this way of life?' 'Fortunate!' said he, as if surprised at the term being in any way applied to him, and he added nothing more excepting a kind of laugh, which seemed to say, 'It is long since good fortune and I parted.' 'Come along with me,' said the student, and he led the way to what is called the town moor." Lord Arnley here looked up, as if the story were disagreeable to him, and appeared inclined to interrupt it, but presently cast his eyes again on the volume which still lay before him. Charles proceeded. "And what do you get for carrying in a load of coals?" "Any thing you like," replied the poor man, fixing his eyes on the face of the querist; "but it seems strange that such as you should come on an errand like this." "Such as me!" said the youth, and he surveyed his dress, which chanced to be very plain. "You may always know a gentleman by his voice," said the poor man.

The student did not decline the compliment, but, being still under the influence of a depressed spirit, he said, "God knows I may one day be as you are." "Impossible," said the coal-carrier, "for the same disease which would unfit you for better labours, would equally unfit you for this. Unless indeed derangement—a madman may carry coals." "And why, my poor man, are you in this situation? Your mind seems far more fitted for labour than your body." The man sighed, looked hard in the face of the student, and said, "May I ask if you really require my services in my poor calling?" "No, I do not; but the fact is, I have this morning left my home, if such I may call my place of abode, in quest of materials for a tale." "You are an author, then?" "I have no occupation—no profession—no trade—and, I fear, no capacity for the only resource which seems destined for me. I depend upon one (here the voice of Charles grew husky, and he almost repented of his boldness in introducing the sentiments which followed), who, in the language of the world, has been unprecedentedly kind to me; for the orphan of a domestic had no claims beyond sustenance and a mere trade. I certainly have been brought up—as yes, I must say it—as a gentleman. But I had rather have been the free brat of a gipsy, than the sport of fit-and-start kindness." The student here checked himself all of a sudden, as if surprised at his own unwonted and uncalled-for openness, and to such an auditor. "I will not," said the man, "profess to be honoured by your confidence, for you cannot intend to place any in such as I, but—and he fixed his sunken though still fine eyes on the youth's face—"it is remarkable that there is betwixt my early condition and yours a certain similarity; and although I have never told the cause of my misery to any other than a priest, I shall in all but names tell you why I am thus. I am the son," said the old coal-carrier, "of a man who, thirty years ago, kept a respectable inn in the town of—I shall call it Bristol, but we lived more to the south. It was my misfortune to be endowed with a most singular beauty of countenance; no one—I speak of the immediate period at which my short history commences—no one ever saw me without stopping to inquire who and what I was. When in my fifth year, chance sent to our house—for it was not a hotel—Mr C—, his lady, and little son, then about my own age. I unfortunately attracted the notice of this group; the boy declared he could not live without this pretty playfellow; and, finally, as he was an only child, heir to an immense

property, and not much contradicted, my father was prevailed upon to part with me, under the promise, which was solemnly kept, that I should be well cared for. I was educated with, and like, my young master, until he went to Oxford, when it was deemed proper to separate us, and have me taught the routine of law business, so that I might be fit for the office of a confidential secretary in the family. Just when young Mr C— came of age, his father died, leaving him sole heir to one of the first properties in England. His lady mother, though handsomely dowered, remained with us. I say us, for though I never ate with the family upon any occasion, yet in all else I was like one of themselves. In his twenty-third year, my master became attached to a young lady; she had no fortune, but as she had recently refused an earl, young and handsome, Mr C— was well assured that interest had no share in her choice. Indeed, who could look upon her and suppose that she had a quality in common with ordinary clay. She was—"Describe her at your peril," said Lord Arnley, breaking in on the relation, and flashing a look at Charles Sevenetti, which was not to be parried. He therefore cast his eyes to the next paragraph, and Lord Arnley bent his forehead upon his extended palms, as they lay before him on the table; nor did he again raise it, until the coal-carrier's narrative ended. "Within a year after their marriage, she presented him with a lovely boy, having the fair delicate skin of his mother, with the dark hair, black eyes, and high features, of his father. In six months after this happy event, which was celebrated as if joy were immutable, I saw that my lovely mistress was somewhat altered. She seemed languid; her eyes were dull; her dimples were less frequently in play, and the slight peach-like bloom of her cheek had disappeared. I have always observed that, in cases of alarm, excessive love runs into either of two extremes. His was the extreme of blindness; but when at last the paleness of her cheek was occasionally varied by the mark of consumption, the fatal red spot, and the lately dull eye shone forth with a new and alarming brightness, his solicitude was of the most agonising sort. I need not dwell on what I can never forget; she sank by degrees; and before her head was laid in the grave, I had the misfortune to observe, that anxiety and unceasing vigilance had shaken the constitution of my master.

I urged change of scene, and, accompanied by the young heir, and a suitable train of attendants, we set sail for a climate more adapted to a sinking frame. Mr C— lingered for some months, while he seemed completely divided between indifference to life on account of his irreparable loss, and an intense desire to protect his son. With a broken heart, he saw that his doom was fixed, and, committing his boy to my care, a charge which I never doubted to fulfil, he departed this life. We sailed for England. My charge was two years and a half old; I never lost sight of him for one moment; could he be otherwise than dear to me! Oh, human nature, thou frail thing! When almost touching our native shore, we were overtaken by a dreadful tempest; destruction at last became inevitable, and the vessel literally went to pieces. On the instant of certain danger, I had wrapped my unfortunate charge in a large sheet of silk oil-cloth, which had been used for some of the fine packages. As I stood upon the last raft, I could descry a portion of his own domains, and the abode of his next heir. For some time I was true to my trust. How shall I tell you the rest! The moment of mortal and of moral trial came. Had I encumbered myself with the boy, I must have perished. One only could be saved; at least I thought so, and in that I am now afraid I was in error. Here the poor man's agony choked him. At last he went on with, 'I quitted my charge, and saved my own worthless life.' Again he paused, and then continued, 'I do not know why I have told you all this, or how it is that I am more than usually affected, for time sears in some measure the worst sores, and I abhor myself most when my anguish is least acute. I reached the shore, stunned, worn out, and, far worse, conscience-smitten. I abandoned myself to want and beggary, and sought, in all that was most foreign to my former delicate and luxurious habits, to find a kind of punishment for my great sin. I had seen in a newspaper an account of the shipwreck of the Ann, and a statement that every soul on board had perished. At last I became Catholic, and sought comfort in a rigid discharge of church discipline. But I thought the good priests I met with too soothing, when in general they sought to console me on the plea that at such a moment human nature could scarcely be expected to call its more noble qualities into action. Their lenity disappointed me, and I longed for some severe infliction. I wandered from place to place, and at last reached this town, where I understood that a stern priest exacted the last tribute to remorse. I laid my heart open to him. He said that my crime was of the deepest dye; that the weakness of human nature formed no excuse; that I had been actuated by the mere paltry love of life; and that, in the stimulant of some active passion, he could have beheld a better apology. I had forgotten the long, long debt of gratitude, the brotherly kindness, I had experienced from a superior, and the very peculiar sacredness of my trust. "To such a culprit," said he, "beggary is luxury. To want you must add labour of the meanest order, eat no bread but what you work for, and take no labour that is not offered." The mandate suited the nature of my compunction;

and hence, after a lapse of twenty long years, you see me in the most revolting employment I could devise." Here (continued Charles) the coal-carrier's narrative ended. The curiosity of the student was whetted, and he resolved to quit his present abode next morning, and travel to the coast of —. "The coast of what?" said Lord Arnley, starting up and fixing on his protégé a look of ferocity; "the coast of what?" he repeated. Poor Charles had been strangely excited by the unexpected emotions aroused by his tale in Lord Arnley. The youth had only sought to make the story the vehicle for expressing his weariness of the life he led. But Lord Arnley's last and most fierce exclamations fairly overcame the spirit of the unhappy youth; his knees smote against each other, and he returned the desperate gaze of his patron with that unsteady wavering eye which bespeaks doubt and apprehension.

They stood thus for some moments, perhaps minutes, during which time a rapid revolution seemed to take place in Lord Arnley's mind. "Young man," said he, with something like calmness, "I cannot be blind to the conflict which you are enduring. I am not blind to it; but while I perceive a conflict, I cannot guess at what is actually passing through your mind. Go to rest. Come to me at eight to-morrow morning, and, in the mean time, while something good predominates in my heart, receive and follow an advice. Never besmitten by a love for the toys of life; you will find them as unsatisfactory, as unqualified to satisfy all that is rational in man, as are to a mountebank the bells which jingle round his ears. Would for the sake of mankind—for the credit of human nature—would that I stood alone! but a toy-loving nation must, unless renovated, come to that destruction which is now ready to overwhelm me."

Charles retired to his room, and threw himself, dressed as he was, upon his bed. His mind was disturbed to agony. His story, such as it was, had, from some unknown and mysterious cause, caused the father of Clara some painful emotions. "Was it not ungrateful," thought he, "to have alluded to Lord Arnley's fitful conduct towards himself? But on the other hand, was an involuntary dependence to crush in him all that was manly! Is it a fear," said he, "that I shall be dismissed on the morrow, which thus shakes every nerve of my frame! Such a fear shall no longer have any power over me. Have I, the son of a foreign domestic, picked up in a foreign land, any right even to look at Lady Clara, far less to think of her, and to make her the loadstone which perpetually draws me back after my foot is on the very threshold to depart! This shall no longer be. To-morrow at nine I leave this house for ever." He accordingly wrote a letter of thanks to Lord Arnley for the support he had afforded him, with a brief and somewhat haughty apology for any occasional want of respect or appearance of ingratitude. This letter he resolved to deliver in person at a last short interview. After this he packed up his moveables, and then sought, though still dressed, a little repose. At eight next morning, which was exactly an hour sooner than his lordship's valet generally waited upon him, Charles entered Lord Arnley's room with the agitation of the evening before considerably augmented. He held in his hand what he deemed his last letter to the man who, though dispensing his bounty painfully, had yet given him a seat at his own board, with education, food, and raiment. It was the depth of winter, and in a room well curtained with the deepest green, Charles could not fail to feel himself in almost utter darkness. There was a relief in this: he paused—listened for a word of recognition, next for a breathing—he heard neither. "He talked of opium," thought Charles; "it has produced, as is common, a late effect." He sat down by a window, glad of even a short respite from the fulfilment of his intention. Dark as it was, he imagined that, after a space, he might be able to see where Lady Clara's picture hung. He knew it was opposite to Lord Arnley's bed. "Surely," thought he, "I might discern the shining frame, and the white dress." No, all was black. At last he rose from his seat, walked on tiptoe, and put his hand upon the picture. It was covered with a piece of cloth. The circumstance was but a trifle, yet at that particular moment it seemed portentous.

Surprised at the silence and darkness, he opened a small part of a window-shutter, and saw that a table-cover had been thrown over the picture. Letting in more light, he saw upon a table by the bedside a large empty phial labelled "laudanum," and a letter sealed with black. It was directed to "George Clitheroe, Esq., hitherto known by the name of Charles Sevenetti." He tore it open, and read as follows:—"I am far more guilty than the feeble-minded old man whom you met last night, and whose narrative related to your parents, and your supposed death. I was your mother's rejected lover; I was your father's heir. I hated him; and that hate, with my thirst for luxurious toys, led me to crime and misery. I have long led a life of suspicion and dread, and you have been its main object. Strange to say, I feared, from the very commencement of your story last night, that you had met the old man, the unfaithful servant who had left you to the waves, and the only person who could reveal your history, if he had known you. That old man I know well. I watched him long from fear; but at last I lost all dread on his account. But this is yet myste-

rious to you; it may soon be explained. By a most wonderful chance I picked you up on that fatal morning of your shipwreck. I had a retainer in Italy, who told me of all your father's movements, of his death, and of your sailing in the *Ann*. An anxious restlessness seized upon me. I was never distant from the shore. I had seen a vessel in the offing the night previous to the wreck, and, viewing her through my telescope, persuaded myself it was the same which bore the little person that stood betwixt myself and wealth to my heart's utmost desire. A tempest came on in the twilight; wrapped in a large cloak, I watched its progress through the night; the brig went to pieces, and—good God!—you were rolled to my very feet. Something told me—assured me—it was the child whose death I had almost half wished. The temptation was too strong. I walked some miles along the coast, until I arrived at a miserable hut, examined your clothes, and found that I was right. You had revived during the walk, smiled in my face, but I had nothing worse in me than to conceal you, and I resolved to care for your life. I easily imposed a tale on the peasant, left you in her care until I procured a horse, and, wrapping you up in my cloak, galloped to London. By a series of stratagems I contrived to bring you from Italy as the child of a servant who had previous to his death rendered me an essential service. This is all I need say—the subject is death—and the dread cup stands before me which will place me beyond your just resentment. Lady Clara and you love each other. Be happy, but conceal from her the guilt of her father; and let her think, as all but you will be inclined to think from the seeming happiness of my earthly fortunes, that my death was accidental. I have left her my injunction, as if of old date, to give her hand to you; and I know, for I have long read her eyes, that she will be but too happy to obey. Farewell.”

Within a year after this event, the old coal-carrier was comfortably situated in a cottage near A—hall, and tasted happiness which he had long ceased to hope for in life. We shall say no more, for from this the reader may guess the happiness that fell to the share of the other personages of our story.

A FEW WEEKS ON THE CONTINENT.

BRUSSELS.

THE railway from Malines, by which nearly all travellers now arrive in Brussels, terminates at the outskirts of the lower part of the town, on a level plain, through which, from north to south, flows the river Senne. On a small island formed by the Senne, a chapel and a few houses were built about the year 600, and thus was commenced a town which spread to both sides of the river, and, gradually ascending the face of a sloping hill, was surrounded with walls, and named *Bruxelles*, or *Brussels*—a term said to be equivalent to *Bridgetown* in the old Flemish tongue.

In the present day Brussels is found to have stretched all over the face of the rising ground to its broad summit, where now the finer part of the town is situated. The hill, which fronts the south and south-west, is of that easy inclination which permits streets to be built upon it in regular order, and, though inconveniently steep in some places for the passage of wheeled carriages or horses, it is nowhere unsuitable for walking. The lower and upper town, as they are called, differ in many respects from each other. The Markets, the Theatre, the Exchange, the Post-office, and the Hotel de Ville, also some splendid old family mansions, fashionable in their day, and a large infusion of mean thoroughfares, occupy the lower division. The upper consists almost exclusively of the elegant mansions of the gentry, the finest kind of hotels, the palaces, Senate-house, and other structures of a superior description; also the Park. Along the western Boulevards, an exterior road leading down to the lower town, there are likewise many mansions of modern date, the residences of persons of the higher classes. Brussels is not a brick town. All the houses are built of stone. In the upper part of the city, every edifice is painted white (in oil), and this, with the equally white jealousies of the windows, imparts a strikingly brilliant appearance to the streets, particularly in the sunshine of summer. Some of the descending streets of the best order are likewise painted; but the farther down you proceed, the darker and more ancient is the aspect of the houses. Another peculiarity is observable. The names of the streets, and the words on the signboards in the higher town, are in French, and in the lower they are in Flemish. In some cases they are both in French and Flemish in the lower, as if to suit two sets of people which the town contains—as, for example, “*Oude Kirk Straat*, *Rue de l'Ancienne Eglise*,” which may be observed marked together on the corner of one of the streets.

It may be seen at a glance that Brussels is a remarkably fine town, and that, though not large, it is entitled to rank with Paris and other first-rate continen-

tal cities. It cannot certainly show any series of elegant streets like that of the New Town of Edinburgh, but, on the other hand, Edinburgh is deficient in such structures as the royal palaces of Brussels, and has nothing to compare with the Park. The Park of Brussels resembles the garden of the Thuilleries, but with lofty trees instead of shrubs. I do not know any city view more imposing and beautiful than that which we obtain from the Place Royale across to the entrance of the Park. The Place Royale is a large open square (no enclosure in the centre of it as in our English squares), surrounded with tall handsome edifices, with the church of St Jacques in the centre of its southern side; opposite this church the street Rue Montagne de la Cour, in which are the principal shops, leads down a mile in length to the lower town; and on the western side of the Place there is an opening which leads to, and exposes to view, the grand entrance to the Park, and the long terrace-like street called the Rue Royale, which bounds the Park on its southern side. The appearance of every thing at this part of the upper town is on a scale of princely magnificence. The Park, to which a stranger usually proceeds on his first excursion through the town, is planted with rows of trees at its sides, and also radiating from a centre, where there is a pond in which golden fish are confined for the amusement of the promenaders. Thick shrubberies, light coppices, two deep dells, and patches of green-sward, variously disposed between the divisions, give variety to the scene, while at different points are disposed marble statues, busts, and vases, in the style of the Thuilleries' gardens. The Park formed the chief battle-ground on which the revolutionary struggle took place between the Dutch troops and the people in 1830. Marks of this deadly conflict are still discernible on the trees, many of which having been dreadfully shattered with the cannon shot, have their wounds plastered with sheets of lead, or are otherwise repaired. The Park, as we observed, is the chief place of promenade on Sundays. On this day, which, as formerly mentioned, is one of perfect recreation in Brussels, a military band takes its station in one of the clumps of wood near a central plot, where there are numerous seats dispersed around for the visitors. All classes move hither in crowds on these occasions; and from the immense concourse which is seen moving in all directions, a good idea may be had of the luxury and fashion of the Belgian metropolis.

The Park is environed with a number of the principal state buildings. At the western extremity is situated the Senate House, and opposite it, on the east, close by the Place Royale, is the palace of the king. At the north-east corner, adjacent to the king's palace, stands the palace of the Prince of Orange. The king's palace, now inhabited by Leopold, is a handsome Grecian structure of large extent, no way secluded from the street, and is said not to contain any thing of particular interest to strangers. The love of sight-seeing is concentrated on the palace of the Prince of Orange. Here we found a crowd waiting for admission, and, taking our place, we were allowed to enter as soon as a previous set of visitors had been dismissed. The edifice, which measures 230 feet in length, was planned by the Dutch architect Vanderstraten, and finished for William, king of the Netherlands, only about a year before the revolution which displaced his dynasty in 1830. Exteriorly, it consists of a rustic basement, surmounted by Ionic pilasters extending along its two stories, and is tasteful in its appearance. The interior is disposed so as to render the ground-floor of no avail except for mean purposes; the whole strength of the design is thrown into the series of apartments on the first floor, which we reach by an exceedingly grand staircase of marble. Having arrived at the upper lobby, the crowd of visitors are told to halt until each person has his or her feet invested in a pair of soft woollen slippers over the shoes, in order to save the floors from being injured. All being properly accoutred, we are bid to enter the first apartment in the suite. The first thing remarked on entrance, is the smooth polished floor, along which we glide or skate, rather than walk, the surface being to all appearance as slippery as a sheet of ice. The floor of each room is of a similar kind, and consists of small pieces of rosewood, oak, and other very fine woods, set in stars and patterns of divers shapes, like mosaic. These floors alone must have cost some thousands of pounds. The suite of apartments consist of the usual court-like waiting, reception, throne, dining, and ball rooms. They are diversified in appearance by the colours of their walls. One is decorated with hangings of green silk, another is crimson, a third blue, and a fourth crimson velvet with gold fringes. The curtains of the windows are of a similar silk fabric with these gorgeous hangings, or coverings of the walls. The ball-room or grand saloon is a spacious apartment, surrounded with walls of a light yellowish-coloured marble, and enriched with twelve or-molu stands for candles, of twelve feet in height, each of which, it was mentioned to us, was worth £600. From this apartment we were led to the vestibule where we had entered, there divested of our clumsy foot trappings, and conducted to the door. Here, on passing out, each paid his fee; altogether for our party of four, six francs were exacted; and I should suppose that the person who acts as showman must clear something like £1000 a-year for his trouble. At present, the house is under national sequestration.

Brussels contains a number of public buildings, a picture museum, and an institution for exhibiting

philosophical and other instruments, all of which, with one or two private palaces, form objects for the visits of strangers. As descriptions of such places, however, usually have little interest, I offer only the following sketches of what came under our notice.

In proceeding down the Rue Montagne de la Cour, the eye catches a tall Gothic spire rising in prominent relief from the centre of the older portion of the town beneath. This is the tower of the Hotel de Ville, an edifice which stands on the south side of an open market-place, near the foot of the street. This square is surrounded with exceedingly picturesque buildings, in the Spanish style, harmonising well with the magnificent structure of the Hotel de Ville, which they environ. This large pile of building is several stories in height, and of great length, with a vast number of windows in front, and also in the tall narrow roof. The tower springs from nearly the centre of the front, and, rising to a height of 364 feet, is probably the finest specimen of the Lombardo-Gothic in the world. It is light, elegant, and pointed with a gilt copper figure of St Michael standing on the apex, as a vane. The house is quadrangular, with a square in the centre, and is now used for municipal purposes, including those of the police. It was erected in the year 1441. In the grand saloon, on the first floor from the street, Charles V. held his court while in Brussels, and here, on the 25th of October 1555, did he abdicate his sovereignty in favour of his son, Philip II., through whose cruelty the northern Netherlands were lost to the Spanish crown.

The cathedral of Brussels, or church of St Gudule, is another fine old Gothic structure meriting the admiration of visitors. It stands in one of the old sloping streets, with an open space around, and its spires, though not tall, are seen at a great distance. It was erected in 1275, but, having been partially destroyed by a mob of violent reformers in 1579, much of it is of a more modern date. The appearance is nevertheless old and dingy, and at present considerable repairs are in the course of being made on the exterior ornamental stones. The interior is remarkable for figures of saints in stone on the rows of pillars in the nave, and a pulpit of carved wood-work. The figure of each saint, which is ten feet in height, and elevated twenty-five feet from the floor, is sculptured with surprising skill: the whole are by Flemish and French artists. The pulpit, which stands on the open floor between two of the pillars, is a most elaborate work of art, emblematic of the Fall of Man. Adam and Eve are represented the size of life, sustaining the globe; an angel is driving them from Paradise, and Death is pursuing them. The figure and countenance of Adam (carved in dark yellow wood) are exceedingly expressive and striking. The concavity of the globe forms the pulpit, which rests upon the tree of Good and Evil, laden with fruit, and decorated with birds, some of which, by the way, it would be difficult to find in any work of ornithology. The tree is represented as growing up the back of the pulpit, with its branches and two angels supporting the canopy overhead. This beautiful work of art was executed by Verbruggen of Antwerp, in 1699, and was presented to the cathedral of Brussels by Maria Theresa a few years later. The church contains several splendid objects in the side chapels, besides some monuments of distinguished personages connected with the history of the Netherlands. The grand altar is a gorgeous structure of white marble, erected in 1743, from a bequest of 18,000 florins made by a pious and wealthy widow in the town. Latterly, the windows have been filled with modern coloured glass, representing scriptural scenes; they are spoken of as being well executed, but they seemed to us extravagantly full of blue, and are inferior in taste and tone to the old painted windows of Gouda.

Brussels possesses an object of art which the people have almost deified, and which they look upon as a sort of palladium of their city. This is a small figure of a man, or rather of a boy, in bronze, which is drolly placed over a fountain at the corner of a street in the lower town, and is known by the name of the “*Mannekin*.” The history of the little fellow is quite farcical. The figure, which was originally of stone, is said to have existed in the seventh century. It was, however, by some means broken, and replaced by a figure in iron, and this again was succeeded by the present one in bronze. It seems to have been a mighty object of desire with the enemies of Brussels to steal the Mannekin, and he, accordingly, was frequently carried off; but to keep him was impossible—he was always recaptured and brought back. It being the practice to decorate him on fête days, the Emperor Charles V. gave him a complete suit, and settled a pension on him. Peter the Great of Russia came to see him, and, bowing before him, said, “*Sir, I have come to see you, since you go to see no one*,” and added to his pension. Duke Maximilian, in 1698, gave him not only fine clothes, but invested him with his order. Louis XV., to protect him, as he said, from the violence of his soldiery, though actually to please the citizens of Brussels, gave him a full uniform, and solemnly decorated him with the order of St Louis. It is a positive fact, that, in addition to these gifts from sovereigns, several people have made the little man votive gifts, while others have actually remembered him in their wills. Within the last twenty years, a lady left him an annuity of 120 francs. He has a regular valet-de-chambre, who is paid 400 francs a-year for dressing him on fête days; and a treasurer

who is responsible for his disbursements and revenues. And all this for a piece of inanimate metal! *Vive la bagatelle!*

In respect to manufactures, Brussels is no longer a seat of the tapestry or carpet trade, for which it was once eminent. In the present day it produces a number of miscellaneous articles, particularly lace, which no other place can match. We went to see the principal lace manufactory. It is situated in a house in one of the descending streets near the cathedral, and belongs to Messrs Duquetiaux and Sons. The establishment consists of a number of young women, who are busily engaged in making lace sprigs and edgings, while others are employed in working them on net, for veils, flounces, tippets, &c. The females kept at this minute kind of work are poorly paid, notwithstanding the excessively high prices of the lace; and a suggestion from the attendant, that our dropping a trifle into the box for donations from visitors would be a deed of kindness to the inmates, met with our prompt attention.

The business of printing and publishing has for some time formed one of the chief trades in Brussels. The works produced are nearly all in the French language, and many of them are reprints of Parisian editions. A number of English works are also reprinted in a cheap and convenient form.* The existence of Belgium so near France is most detrimental to the business of publication in Paris. The language of the two countries being, as far as literature is concerned, the same, no sooner is a new work of any merit issued from the press in Paris by a French author, than it is reprinted at Brussels, and that in a perfectly legal manner. The French have long complained of this species of legalised piracy, but without avail; the Belgians alleging, in vindication of their conduct, that their works are equally copied in France; and, moreover, that the French speak of invasion of copyright with a bad grace, seeing that they habitually reprint the works of English authors. However this state of things may be finally settled, in the meanwhile a great trade is carried on at Brussels in publishing works of foreign and native origin. I went with my friend and companion of my journey, Mr Orr, to see one of the largest of the book manufactories, which belongs to a company of individuals, among whom are numbered some of the functionaries of the present government, and was kindly shown to us by the practical manager of the concern. In this, as in other establishments, all the operations necessary for the mechanical preparation of books are conducted together—printing, binding, and selling. By this aggregation of departments of trade, by the lowness of wages, and the cheapness of paper, the company of which I speak can manufacture books at a rate cheaper than can be done in Britain, but I feel assured not lower than what could produce them for, were the duty of 1½d. per lb. entirely removed from our paper, because our machinery is much superior to that of Brussels, and this alone would compensate for a higher rate of workmen's wages. The large publishing establishments of Brussels manufacture books for exportation to a prodigious extent. They send their wares to all the principal towns in Germany, Russia, Italy, Greece, and other quarters, thus carrying on a kind of trade of which we in England are comparatively ignorant, and are shut out from, in consequence of the local character of our language, and our infinitely dearer mode of manufacturing. It is exceedingly apparent to the stranger on the continent, that the simple mode of "getting up" books with a mediocre kind of printing and thin paper covers, has a powerful effect in multiplying and disseminating literary productions. In Brussels especially, the book shops are very numerous, and many persons of a humble order may be seen with a volume or a paper in their hands. In walking through the streets on Sunday, I had occasion to observe that a number of young women, who were left in charge of the shops, were sitting behind the counter diligently perusing a book. The activity displayed in reproducing French literature is in nothing more conspicuous than the announcement which took place, during my stay, of an edition of a certain Parisian newspaper, which was to be issued within an hour after the arrival of the paper from Paris.

Brussels possesses a botanical garden, supported by a company of shareholders, which is of great extent and beauty, and forms a delightful promenade on the days on which it is open to visitors. It is situated on an irregular piece of ground on the western Boulevards, at a place greatly improved by the removal of the old walls. In the same quarter, in the midst of a pleasant garden, is placed the royal observatory, an institution over which I had the pleasure of being conducted by the accomplished M. Quetelet, chief astronomer. The observatory contains a number of instruments of great value, but, as may be supposed, of foreign manufacture.

In the environs of the town near the western Boulevards, there is an establishment of a very remarkable kind, connected with literature and the arts, exceedingly worthy of notice. I allude to the "Etablisse-

ment Geographique de Bruxelles," or "Geographical Establishment of Brussels," which was founded in 1830 by its present proprietor, Mr Philippe Vandermaelen. This gentleman, who is a native of Belgium, is a person of great ingenuity, perseverance, and practical benevolence. Professionally, he conducts at his establishment the largest business of designing, engraving, and lithographic printing, in the kingdom, also letter-press printing. The principal department is, I believe, that of lithography, in which maps, charts, and pictorial embellishments, are produced to an inconceivable extent. Globes are likewise made of a large size, some being as large as upwards of two metres fifty cents, or about seven feet, in circumference. In the preparation of all these works of art, Mr M. Vandermaelen, brother of the founder, unites his exertions and superintendence. So much for the mere business part of the concern. The object of the proprietor not being to accumulate a fortune, but to do good in the meanwhile with the means in his hands, he has associated with his undertaking an educational and generally instructive institution. Proceeding through the main front edifice of the establishment, we see before us a fine large botanical garden, and on each side saloons for a library, museum of natural history, geology, and animal physiology, also for the delivery of courses of lectures on various branches of science. All the instruction communicated in those departments of human knowledge is gratuitous. A great number of young persons, from the age of fourteen to eighteen, are admitted to receive instruction under masters, and no reward whatsoever is sought by the proprietor of the institution, further than the approbation of his own benevolent mind, and the consciousness of elevating young men of ability from a humble to a higher sphere, in which they are calculated to shine. The library of the institution has been collected in a manner so peculiar, that it deserves to be noticed. Visitors who happen to have any books which they can spare, are asked to exchange them for some other works, the produce of the establishment, and by this means books of all the civilised nations in Europe have been collected to an immense extent. By this and other modes of acquisition, the library is now very large, and is open to all who may choose to make use of it. Every thing considered, the establishment of Mr Vandermaelen is one of the most interesting institutions in Brussels, and affords a striking proof of how much good may often be done by one enterprising and well-regulated mind.

THE DEANSTON COTTON-WORKS.

THE large cotton-spinning establishments in connection with the trade of Glasgow, are not all situated in that city or its environs; many are placed in localities favourable for their water-power at a considerable distance in the country, as, for example, at Catrine, in Ayrshire; New Lanark, on the Clyde, near the celebrated falls; and at Deanston, in the southern part of Perthshire. From a paper just published in the *Inverness Courier*, written we should suppose by the editor of that northern print, we are enabled to present the following abridged account of the cotton-factory at Deanston, the facts of which must be new to many of our readers. Deanston, it may be premised, stands in the beautiful vale of the Teith, on the banks of the river of that name, near the village and ancient castle of Doune, and about eight miles north-west from Stirling, on the way towards the Trossachs and Loch Katrine.

Deanston Cotton-Works employ above eleven hundred persons, young and old, and contain the most perfect machinery in the kingdom. The first erection took place in the year 1785, by the Messrs Buchanan of Carston, four brothers, the eldest of whom was an intimate acquaintance of Sir Richard Arkwright, and was his first agent in Glasgow for the sale of cotton twist. The English had annoyed Sir Richard so much by invading his invention, that he resolved to instruct young Scotsmen in the art, in preference to his own countrymen; and among others, Mr Archibald Buchanan (now manager of the Catrine works, Ayrshire) went apprentice to Sir Richard, and was the only one who had the privilege of living in the house with him. Sir Richard was an old bachelor, and was so intent on his schemes and calculations, that young Buchanan and he often sat for weeks together, on opposite sides of the fire, without exchanging a syllable. The old man, however, was in his other moods extremely kind and familiar, and recollected his pupil in after life.

The powerful fall and supply of water in the Teith having suggested to the elder of the Buchanans the idea of placing a cotton-spinning establishment at this spot, where it now stands, the scheme was soon ripened into action. There was a lint mill with a dam upon the property, and the owner disposed of the mill to him, and gave him a few acres along the margin of the stream. Carding and roving for jenny-spinning were then the only processes which were driven by power (as it is termed), and for this purpose the old lint mill was appropriated, a building being erected close by for the reception of the jennies. At first, the Highlanders were shy of entering this tower of Babel, with its unknown sounds and sights: they considered it a sort of prison. From the respectable manner in which the works were conducted, they were gradually reconciled to the employment, and were quite willing that both themselves and children should be engaged. Archibald Buchanan was then a fine athletic young man of eighteen or nineteen, of a social generous dis-

position; he mingled with the people; and thus a number of active young men of the district, of the better classes, were led to work at Deanston; and so expert did they become, that as fine yarn was then spun at Deanston as has subsequently been made by the best spinners in Manchester. Some of these young men afterwards made fortunes in business, and the firm of the Macphails in Glasgow (extensive spinners and power weavers) had its origin in one of the family repairing from Ross-shire to work at Deanston.

In the year 1793, the works at Deanston passed into the hands of a Yorkshire Quaker, a benevolent old gentleman named Flounders; and in 1808 they became the property of James Finlay and Co. from Glasgow, with whom Mr Archibald Buchanan had become connected. The establishment was at this time remodelled under the charge of the present manager, Mr Smith (a nephew of Mr Buchanan), who is well known for his mechanical as well as his agricultural inventions and improvements. In 1822, the company made arrangements with the neighbouring proprietors for additional water-power, by which they acquired a fall of 20 feet, making the whole fall 33 feet.

An extensive plan of enlargement and improvement was now adopted; the works were thriving, and machinery was daily becoming more and more perfect. In this plan, it was proposed to erect eight water wheels in one square building, each to be 36 feet in diameter, and 11 feet wide inside, being overshot, and having the shrouding and buckets 24 inches deep. At present four of those wheels are in operation, and pedestals have been erected for two more. They are the most gigantic-looking things we ever saw, and distribute, by innumerable shafts, the whole of the vast concentrated power over the different apartments. Each wheel has a power equal to eighty horses!

The whole of the works are lighted with gas, and they possessed this advantage so early as 1813, before any of our towns could boast the same brilliant light. Tunnels are made all under ground, by which communication can be had with the different departments without going out of doors, and every other facility has been adopted for carrying on the operations. Carts proceed daily to Glasgow with the produce. The construction of the various works must have cost an enormous outlay of money, and a considerable charge annually will be brought against it in the shape of interest; but we were informed that the power being once acquired, the annual expenditure for management and repairs is small indeed—not exceeding, on the average, £400 per annum. The steadiness of the stream of the Teith, which flows from Loch Katrine and five of her lakes, renders the command of water extremely uniform, and the loss of a few hours' work per day for a week or fortnight in the driest period of summer, is all the stoppage the works ever experience.

The process of manufacture may be described as follows:—The bags of cotton, containing each about 300 pounds weight, are laid upon the floor in rows, taken out and thrown into a machine called a *Willow*. This willow is a revolving cylinder with iron teeth, which divides and breaks down the masses. The material is then conveyed to another machine, which used to be called the *Devil*. Burns, in his admirable Address to the Deil, expresses a hope that he would take a thought and mend, in consequence of which he might still have a chance! The cotton-spinners' devil has experienced this agreeable reverse of fortune; for, since it has been improved and remodelled, it goes by the name of the *Angel*. The cotton is then weighed in small portions, spread out, and put into a machine which determines and regulates the girth of the thread. Passing through pairs of rollers, the cotton is struck by iron beaters (as in a thrashing-mill) at the rate of six thousand feet per minute! The lighter dust is drawn through a revolving wire sieve by the action of a fan, and is thus blown to the open air, ridding all the processes of that annoyance which used to be so hurtful to health. The cotton is now in the form of a web—is next wound on rollers—and put to the carding-machines, whereby the fibres of the cotton are completely separated, and any remaining lumps or refuse are taken out.

The machines used here are of a peculiar construction, in which a process formerly done by hand is now performed by mechanism, and for which Mr Smith holds a patent. By the variously improved construction of this machine, the saving of labour in this process will amount to about thirty per cent. Some peculiar and beautiful movements are introduced, but it is impossible to describe them. The next process to which the material passes, is the drawing machine, wherein the fibres are drawn into a parallel and longitudinal position, by means of successive pairs of rollers, the first pair holding the material, and allowing it to pass with a slow progress, whilst the second pair lay hold of it and pull it in the same way as a man draws straw for thatching. When the fibres have been sufficiently brought to parallel (which is done by repeating this process three or four times in the same machine), the material is carried to what is called a *roving frame*, where it is drawn to a much smaller girth, and then twisted into a thready form, and is wound upon bobbins. These bobbins are carried to spinning machines, when the girth is still more reduced, until the thread reaches its desired size, when it is twisted sufficiently firm to become thread fit for weaving. The thread intended for warp is spun upon a machine

* In the Rue Montagne de la Cour I found a bookshop kept by a Mr Todd, a Scotchman, from Edinburgh, and a most respectable person in his line. The number of English in Brussels is sufficient to support an extensive circulating library of British publications under Mr Todd's charge. In this place I observed for sale, Brussels editions of English works, at about a tenth of the cost of the original London editions.

called a *throstle*, which is a modification of Sir Richard Arkwright's original machine, and at this work a recent American invention has been adopted; it admits of great velocity in the twisting process, and, consequently, produces a much greater quantity of work in the same time. The bobbins, by the movements of which the twist is thrown into thread, go at the amazing velocity of 8000 revolutions per minute! The effect is magical. These machines are attended by children, chiefly little girls, who are singularly dexterous, and they are superintended in divisions by grown-up women—one male superintendant having the general charge of a department. The work is light and easy, but requires constant attention, and great cleanliness and order, and thus it may be said to form an excellent school for training the young to habits of attention and industry. These little girls follow the employment with spirit and cheerfulness, from eight to twelve hours a day. The yarn intended for woof or weft is upon the *mule jenny*, a machine invented by a Mr Crompton, near Bolton, Lancashire. It is an adaptation of the twisting process of the old jenny, or muckle wheel of this country, to the drawing process of Sir Richard Arkwright. Hitherto such machines have generally been worked by men of great strength and skill, who acquired high wages, and were the chief movers in all the combinations of the cotton trade. To obviate the inconvenience of these strikes, the attention of mechanical men has been for many years directed. The machines employed here were invented by Mr Smith some years ago, for which he holds patents for the United Kingdom, most of the countries on the continent of Europe, and for America. The machine is now being extensively introduced in the trade generally. Mr Smith has just completed an adaptation of this principle to mules for spinning wool, and which is likely to be of vast importance in the present rising state of the woollen manufactures of our country.

The invention of this machine removes the only laborious and slavish employment that remained in the cotton manufacture, and effects a saving of about 50 per cent., besides producing an article of superior quality, and insuring regularity. It has created a demand for young females' labour, who are better paid than when they worked under the spinners—the money being thus more equally distributed. It gives, besides, to this country an important advantage over the cheap labour of other countries.

In preparing the warp for the weaving process, from 500 to 1000 bobbins are arranged in regular rows in a wooden frame, and from these the threads proceed towards a beam, or roller, on which they are wound, having a peculiarly beautiful appearance, the threads converging towards the mass, like the rays of the sun from behind a cloud. Being collected, the threads are passed through a machine whereby the threads are stiffened, by being immersed in a paste formed of flour and glue boiled together with water. Brushes attached to mechanism sweep along the surfaces of threads, laying all the fibres, and rendering them smooth and uniform. Fanners are put in rapid motion, and blow heated air upon the mass of threads, so as to render it perfectly dry before being placed on the weavers' beam. From this it is carried to the power-loom, where the whole operations are performed by mechanism; the young women, who attend two looms each, having merely to supply the woof from time to time, and mend such threads of the warp as may break in the process. The woof is supplied in little pirns or cops, formed on the self-acting mules; each loom will, on cloth of ordinary thickness, such as a common calico, produce about thirty yards per day, making 60 the work of each girl. These looms, to the number of about 300, are arranged in rows, with alleys between, in a most spacious apartment, which, when lighted with gas, has a most magnificent effect.

In going over the vast establishment, it seemed to us like entering an illuminated village, and we shall not soon forget the effect of 300 gas-lights in one apartment. This building is quite novel in its structure, the roof being composed of groined arches, supported on cast-iron columns, 12 feet high, and the rise of the arches being 6 feet; the greatest height of the ceiling is 18 feet. The groins are in squares of 33 feet 6 inches, and in the centre of each groin there is a circular opening 8 feet in diameter, surmounted by a handsome glass cupola light, affording a most uniform and perfect light for the operations carried on below. The arches are rendered water-tight in the most simple manner by a coating of pitched coal tar, about a quarter of an inch in thickness, and the whole is covered with three or four feet of soil, intended to form a garden for flowers and other plants. It is remarkable, that, during the intense frost of the winter 1837-8, the hardening did not penetrate more than one and a half inches into this soil—owing, doubtless, to the heat from below. This building covers altogether upwards of half an acre, and every individual in the apartment can be seen from any point. The whole is fire-proof. The general order of management at the Deanston works is very much on the principle of Arkwright—a proof of the talents of that eminent person. There is a head- or superintendant to each department—every one has his own allotted part—and in most cases they are paid by the piece, not in weekly wages. They receive the amount of their earnings every Thursday morning (that being the market day); and the youngest individual about the works is paid his or her wages into their own

hand, which seems to give them an idea of personal consequence. They have all the privilege of leaving any moment they choose, without previous warning; and we were informed that this is found to insure a more steady, agreeable, and lengthened service than could be obtained by the firmest indenture. There is no fine or punishment, excepting for damage to the works through evident carelessness. The order of the establishment is preserved by the dismissal of offending individuals, or their banishment for a limited period. By "stopping the supplies," every member of the family is interested in the good conduct of the whole, and a banished child, man, or friend, finds no rest at home. The morals of the people are in general very correct; no drunkard is permitted about the establishment. We inquired of an intelligent medical gentleman at Douhe (Dr McAnsh) whether the spinners were as healthy as the other villagers. His answer was, "They are not so robust (owing to their confinement), but their health is as steady and uniform."

Immediately adjoining the works is a handsome little village, built and founded by the company, which contains about 1200 inhabitants. The houses are neat, built in one long street parallel to the water course, and are two stories high, with attics. They are most exemplary patterns of cleanliness, and to each house is attached a small piece of garden ground, and a range of grass plot for bleaching. A school-room is united to the establishment, capable of containing 200 children, and a teacher is paid by the company. The young children generally go to school when about five years of age; and as none are admitted into the works until they are nine, they are mostly good readers, and able to write and cipher before they enter the works. The children employed in the works from nine to thirteen years of age, must, according to the Factory Act, work only eight hours per day, and about three hours are devoted to the school-room. The number at this age amounts to 100, and they are divided into relays of 33 each; so that while two relays are at work, one is attending school. The youth above thirteen years of age and under sixteen are expected to attend an evening school four nights in the week; and a Sabbath school in the village contains about 150 pupils. Thus the works at Deanston seem to possess every facility and recommendation; they have changed the aspect of the country—beautiful and romantic as it is—by introducing into it habits of industry, order, and the highest mechanical genius and dexterity; they cause a circulation of money to the extent of about £20,000 per annum; they furnish employment for the people of all ages; they have called forth the spirit and activity of the agriculturists to meet the ever-recurring demands of the place; and in all respects they are a splendid monument of British enterprise, skill, and perseverance.

MRS JAMESON ON FEMALE EDUCATION.

In Mrs Jameson's "Winter Studies and Summer Rambles in Canada," the following emphatic observations are made on the subject of female education:—

"In women, as now educated, there is a strength of local habits and attachments, a want of cheerful self-dependence, a cherished physical delicacy, a weakness of temperament—deemed, and falsely deemed, in deference to the pride of man, essential to feminine grace and refinement—altogether unfitting them for a life which were otherwise delightful: the active out-of-door life in which she must share and sympathise, and the in-door occupations which in England are considered servile; for a woman who cannot perform for herself and others all household offices, has no business here [Canada]. But when I hear some men declare that they cannot endure to see women eat, and others speak of brilliant health and strength in young girls as being rude and vulgar, with various notions of the same kind too grossly absurd and perverted even for ridicule, I cannot wonder at any nonsensical affectations I meet with in my own sex, nor do otherwise than pity the mistakes and deficiencies of those who are brought up sagely with the one end and aim—to get married. As you always used to say, 'Let there be a demand for a better article, and a better article will be supplied.'"

A woman blessed with good health, a cheerful spirit, larger sympathies, larger capabilities of reflection and action, some knowledge of herself, her own nature, and the common lot of humanity, with a plain understanding, which has been allowed to throw itself out unwarp by sickly fancies and prejudices—such a woman would be as happy in Canada as any where in the world. A weak, frivolous, half-educated, or ill-educated woman may be as miserable in the heart of London as in the heart of the forest; but there her deficiencies are not so injurious, and are supplied to herself and others by the circumstances and advantages around her.

I have heard (and seen) it laid down as a principle, that the purpose—one purpose at least—of education is to fit us for the circumstances in which we are likely to be placed. I deny it absolutely. Even if it could be exactly known (which it cannot) what those circumstances may be, I should still deny it. Education has a far higher object. I remember to have heard of some Russian prince (was it not Potemkin?) who, when he travelled, was preceded by a gardener, who around his marquee scattered an artificial soil, and stuck into it shrubs and bouquets of flowers, which, while assiduously watered, looked pretty for twenty-four hours perhaps, then withered or were plucked up. What shallow barbarism to take pleasure in such a mockery of a garden! Better the wilderness, better the waste! that forest, that rock yonder, with creeping weeds around it! An education that is to fit us for circumstances, seems to me

like that Russian garden. No; the true purpose of education is to cherish and unfold the seed of immortality already sown within us; to develop, to their fullest extent, the capacities of every kind with which the God who made us has endowed us."

THE FROZEN PROPHET OF SEVILLAN.

MR MORIER, in his volume of travels entitled "A Second Journey through Persia," &c. mentions, although somewhat sceptically, a circumstance which has since been authenticated as a fact by a British officer. The distinguished plenipotentiary says: "The mountain of Sevilan is held in high veneration by the Persians, who relate that in one of the snowy chasms at its summit is to be seen the dead body of a man always frozen, but in the highest state of preservation (with the exception of one tooth and a part of the beard), and which they believe to have belonged to a *peyghember*, or prophet, whose name the mountain retains to this day. Although this story is in every one's mouth, and confirmed with assurances that many have seen the body, yet we never met with any one person who had himself seen it. We rather lowered what in their estimation is a miracle, by informing them that bodies of any description will preserve entire as long as they remain frozen, and that they had only to seek the frozen market at Petersburg to convince themselves of the fact." The statement of animal bodies being preserved from decay if enshrined in ice, is a well-ascertained truth. The body of a mammoth or fossil elephant was found entire in an iceberg in Siberia about the beginning of this century. As the animal belongs to a race now long extinct, it had certainly remained there many thousand years, how many it would be vain to conjecture. No better proof, therefore, can be afforded of the antiseptic properties of ice; and so far we were prepared to credit the truth of what the Persians asserted regarding their deceased prophet. But all doubt upon the subject has been removed by Captain Shee of the Madras infantry, who, in a letter to Colonel Monteith, thus describes his visit to the tomb:—

"After a ride of eighteen miles, we reached a camp of Illiauts, and had not been long seated before we perceived a party descending, which proved to be the Mulla Bashi of Tehran and Ali Khan, who had been sent by order of the king. They told us it was not worth our while to ascend, as there was nothing to see, and the difficulties were very great. From their fresh appearance we much doubted their having reached the summit, and determined on the following day at least to endeavour to accomplish our object. Two hours before daylight we mounted our horses, with two guides, and rode for six miles, when we were obliged to leave them, and proceed on foot. The mountain did not appear very difficult, but we soon found our mistake. After surmounting four distinct ranges, every one of which led us on, in hopes of being the last, we reached the summit by the east-south-east side at eleven A.M., having been walking five hours; our guide, an old man of seventy years of age, being the first. On the top of the mountain we found a tomb, consisting of stones, neatly put together, and covered, except at one end, where a few stones had been removed to look at the body. In it we found the skeleton of a man lying with his head and body inclining to the right side (turning towards Mecca): the front half of the skull, the left collar-bone, the left arm, from the shoulder to the elbow, with four ribs on the left side, were alone visible: some dried flesh and pieces of the winding-sheet were still adhering to the skeleton. The remainder of the body was buried in ice and earth. The skull was perfect, except some of the front teeth, which were lying about the tomb; twenty teeth are still in their places, perfectly even, and beautifully white. There appears no doubt that before the stones were removed, the body was perfect, and that the remainder, which is buried in the ice, is still so. Having satisfied our curiosity, we proceeded to see an extraordinary stone, out of which (the Persians say) oil is distilled, and at a hole in the top a diamond is seen. After crossing about a mile of snow and ice on the summit of the mountain, we came to an amphitheatre of about 600 yards in circumference, containing a pond of the purest water; the sides were covered with snow, and long pendant icicles gave the whole a beautiful appearance. To the right of the pool, a little higher up, was a cleared spot with a wall about three feet high, enclosing a stone of three feet in height by four in length, over which a quantity of oil appeared to have been poured; in its centre was a hole, which had the appearance of being used as a lamp, and in it a piece of lead to hold a wick, which the Persians had called a diamond. Numbers of offerings were placed round it. Near it was another stone, with some rude letters cut on it. From the appearance of the place, I concluded that at some periods of the year the Illiauts frequent this spot, and perform some religious ceremonies, making the stone the lamp. It took us three hours and a half to reach the place where we left our horses. We returned to the camp we had before left, perfectly persuaded that the Mulla Bashi had never ascended the mountain. Water boiled at 188 degrees of Fahrenheit; the temperature in the tomb was exactly the freezing point."

We have quoted the passage entire, both because it is interesting in itself, and because it proves that the mountain of Sevilan is, or has been, a scene consecrated to religious rites. The temperature at which water boils indicates an altitude of nearly 13,000 feet above

the level of the ocean. It is situated in about latitude 38 degrees 12 minutes, rather more than a degree east from the shores of the Caspian Sea, in the province of Azerdijan. It is much higher than any other elevation in this territory, with the exception of the celebrated Mount Ararat. Sevilan appears to have been a volcano, there being many indications of the fact, although the remains of any crater are no longer visible. There are four distinct peaks or pinnacles which closely resemble each other, and may, at a distance, be mistaken one for another. All around its base are warm springs, but none of them with a heat above 104 degrees, which is far below the temperature of many other thermal fountains. With regard to the individual whose remains have been deposited in this singular cemetery, our travellers are silent. He was, no doubt, one of those impostors, so numerous in countries where the Mahomedan religion prevails, who lay claim to the divine afflatus, and who seldom fail in securing a creditable body of supporters. Whether it was a desire of his own to be so interred, or whether it was an afterthought of his followers, we are not informed. The Illiuts here mentioned are wandering races of Persia, constituting, it is supposed, about one-fourth of the whole population of the country. They form almost a distinct class by the nature of their habits, which are migratory, and by their modes of gaining their livelihood. They are distributed into a number of distinct tribes, who keep entirely separate from one another, like the Highland clans of old.

REMARKABLE ANECDOTES OF DOGS.

The anecdotes given of dogs saving the lives of persons in danger of drowning, are so numerous as to be familiar to every person. "One cannot reflect on the innumerable instances of the love and usefulness of this animal, without being grateful to Providence for having given to man a creature capable of many of those noble and disinterested feelings, which we are accustomed to appreciate so highly in our fellow-creatures, and almost to look upon as constituting the perfection of the human character." I beg leave to introduce to my readers an anecdote of a dog belonging to a friend of mine, but shall first, however, mention a story somewhat similar, related by an author of the greatest respectability, regarding a dog belonging to a religious house in France. "At a convent in France, twenty paupers were served with a dinner at a certain hour every day. A dog belonging to the convent did not fail to be present at this regale, to receive the odds and ends which were now and then thrown to him. The guests, however, were poor and hungry, and of course not very wasteful; so that their pensioner did little more than scent the feast of which he would fain have partaken. The portions were served by a person at the ringing of a bell, and delivered out by means of what, in religious houses, is called a *tour*; which is a machine like the section of a cask, that, by turning round upon a pivot, exhibits whatever is placed on the concave side, without discovering the person who moves it. One day, this dog, who had only received a few scraps, waited till the paupers were all gone, took the rope in his mouth, and rang the bell. His stratagem succeeded. He repeated it the next day with the same good fortune. At length the cook, finding that twenty-one portions were given out instead of twenty, was determined to discover the trick: in doing which he had no great difficulty; for, lying *perdu*, and noticing the paupers as they came for their different portions, and that there was no intruder except the dog, he began to suspect the truth; which he was confirmed in when he saw the animal wait with great deliberation till the visitors were all gone, and then pull the bell. The matter was related to the community; and, to reward him for his ingenuity, he was permitted to ring the bell every day for his dinner, on which a mess of broken victuals was always afterwards served out to him."

The following is the anecdote I refer to. A friend of mine, Captain W. Aug. Thomson, R.N., residing near Edinburgh, has a dog, both the parents of which were natives of Newfoundland. At the time I refer to (1836) he was, I believe, only two years old, but exhibited all the indications of great muscular power, and singular sagacity. He was considerably larger at that time than many full-grown animals of the same breed, and I always imagined his eye possessed a very peculiar degree of intelligence. One day my friend walked down to the sea-beach to observe the military, whose barracks are in his neighbourhood, performing their evolutions, and took the dog with him. All went on very well till the cavalry commenced firing, but such a sound was too much for the astonished Bounce, as the dog is called. Being quite a puppy, like many other puppies, he was not very willing to stand fire, and he therefore considered the best thing he could do was to sound a retreat. Accordingly, without casting a single glance toward his master, he *bounced* away homewards at full gallop, with his tail depressed, and in evident terror. His master's residence is about a mile from the beach, and it appeared the dog ran the whole way at full speed. But as the house is in a garden, and surrounded by a lofty wall, having a gate which is always shut, and which communicates with the house only by a bell, it became a problem to our canine reasoner, how to get within the walls so as to be in safety. The gate he could not open, the wall was too high to leap; how then could he enter? He perceived at once his predicament, and no doubt thought of the bell he had so often seen his master pull, and the sounds of which were so often followed by the opening of the gate. Crossing the road, he ran up to a labouring man who was passing, and with all the gentleness he could assume, seized him by the wrist and held him, at the same time wagging his tail, and endeavouring to direct the man's attention to his situation. The man was at first, naturally enough, much terrified; but the perfectly gentle appearance of the animal prevented his fears from increasing. He therefore

accompanied the dog across the road, and was led close up to the bell, which he at once perceived the animal required him to pull; this having done, he was no longer detained a prisoner, and the gate being opened, he related, in astonishment to the servant, the singular conduct of the dog. This little story is entitled to the highest credit, not only on account of the source I derived it from, but because I myself have seen the dog, when desirous of leaving the room, take his master by the wrist and lead him to the door in order to open it. All this I have been assured is solely the result of the dog's instinct, or rather, indeed, reason, as he never received any instruction. I trust that, although this anecdote has little direct reference to humanity in animals, I may be excused taking this opportunity of mentioning it.—*Fraser's Rights of Instinct.*

USE OF BIOGRAPHY.

THAT "what man has done man may do," is a most stimulating and encouraging truth. It is this consideration chiefly that renders the lives of individuals who have distinguished themselves in their day and generation so interesting to their fellow-creatures; and it is a remark which should be borne in mind, whether we are studying the actions of *great good men*, or of *clever bad men*. In the former case, we should inquire whether we are not possessed of the same qualities, powers, and opportunities (generally speaking), with which they were favoured; and in the latter, that we partake of the same depraved nature, and are liable to the same temptations that led them astray. It is not the history of other beings—of those above or below us in the scale of intelligence; it is neither of angels nor brutes, but of men like ourselves, that we read.

It is a common remark, that biography is one of the most useful studies to which we can apply; but we must remember that its usefulness to us entirely depends upon our right application of it. It is idle, indeed, to take up a book of any kind, merely with a view to entertainment: we hope our readers are all of them by this time above so childish a practice; but it is possible to read with a general desire to derive benefit, and yet without that close personal application of it to ourselves, which alone is likely to do us good. We would therefore recommend, especially to the reader of biography, to keep one grand object in view; and to make this close inquiry whenever such a volume is opened—In what respects is this applicable to me? How can I make it subservient to my own improvement? We will endeavour to offer some suggestions that may assist the reader in this inquiry.

Suppose that a young person in the quiet and humble walks of life should meet with the annals of some great warrior or statesman, he would probably say, "This is nothing to me, except as mere amusement; I have no ambition, at least I have no talents or opportunities, to distinguish myself in public life; I am quite contented with my humble lot; I seek not great things for myself." Herein, indeed, he would show his wisdom; and yet it might not be true that such a history was nothing to him. Whatever is in itself excellent, is worthy of our attention, and more or less of our imitation, however widely our circumstances may differ.

Great talents and splendid achievements are necessarily confined to a few; and as we may be virtuous and happy without them, this is not to be regretted; but it is the duty and interest of every individual to aim at excellence in his own sphere, however humble; and while it may be the farthest from our wishes or our duty to engage in public services, it may still be highly to our advantage to trace the steps, and to mark the progress, by which great men have arrived at eminence. Many of the very same qualities are requisite to make a good tradesman, or skillful mechanic, which are needed to form a great statesman or general.

We shall probably find that such a man was early distinguished from the frivolous or dissolute around him by devotedness to his object: that he made it his study, his pleasure; not merely engaging in it as a matter of course, or of necessity. We shall find that he was not discouraged by difficulties, but rather stimulated by them to more vigorous efforts; that he never consulted his own ease or gratification, when they stood in the way of his grand design; that he was characterised by a disregard to trifles of all sorts, and by a steady aim at the most important ends. Now, as these, among other good qualities, insured to him success and distinction, so we may be assured that the same causes will produce the same effects, in whatever situations they are applied. Thus far a little apprentice boy may learn of Peter the Great, and become, by and bye, as distinguished in his trade as the Czar was in his empire.—*Jane Taylor.*

ESCAPE FROM A TIGER.

Lieutenant F. Hughes, of the 7th L. C., was in the act of stooping to get a flower from the jungle, about 200 yards from the roadside, when he heard a rustling noise behind him: he immediately turned his head to see what it was, when he beheld a huge tiger within a few yards of him. In the fright and hurry of the moment, when endeavouring to rise, he trod on the skirts of his dressing-gown, and fell backwards. He was at the same moment seized by the brute, which caught him over the waistband of his trousers in its mouth. In this position the beast was dragging him, when he got his hand into his pocket, and drew a small double-barrelled pistol, which he placed as direct for the animal's mouth as the position in which he lay would admit, fired, and in an instant he was free; for the tiger made a tremendous spring forward, carrying with it the clothes which it had grasped.—*Asiatic Magazine.*

INSTANCE OF PRESENTIMENT.

When one of our squadrons was blockading either Brest or Toulon, the flag-captain had occasion to send for one of the warrant-officers, a veteran who had shown his undaunted face in some of our severest actions, to receive some directions on the quarter-deck. As the ship was

just standing off the shore, and nearly three miles from it, a shot was fired from one of the batteries. On seeing the flash, the old seaman clenched his hands, and exclaimed, "That's for me! I know it is for me!" The astonished captain had scarcely commenced his rebuke, when the poor fellow's trunk lay bleeding on the planks. The gun must have had an elevation of 12 degrees, or more, so that the chances of its touching any thing but the sea were enormous; and the person destroyed was the only one who even thought about an effect. [Without speculating as to whether "every bullet has its billet," and whether the Orientals are altogether wrong in their doctrine of Fate, it may be observed, that nearly every officer of long experience in the military service adduces some such instance as the one now related.]—*Newspaper paragraph.*

TRUTH.

The following admirable passages on the value of truth in literature occur in a late number of the *Athenaeum*:—"To party writing *per se* we have no objection: in its place and season it has its uses; and when confined to its appropriate channel, should (critically as well as legally) be free to speak out manfully. But such writing is altogether foreign to the purposes of literature: Truth is of no party; and Literature, designed to 'polish manners, and raise man above a state of brutality,' cannot but suffer in its utility by the amalgamation of the two. The periodical criticism of our times has been graced by the contributions of the most gifted writers in the nation, and has recorded their opinions on many of the principal subjects at issue among men; and it is surely to be deprecated that posterity should have its confidence in these productions shaken, by their juxtaposition with all sorts of one-sided views, party misstatements and revilings, and with judgments almost avowedly passed on men and on things with a sole reference to party effect. The right, the true, and the beautiful, belong to a higher and a purer atmosphere, and are not contingent upon the accidents of church and state arrangement. Is it not, then, a miserable defect impressed on our national intellect—an evil beyond adequate expression—if it should turn out that this fashion of party journalism has gone very far to incapacitate the masses for the reception (or the conception) of ubiquitous and eternal truths, and deformed their humanity by a sectarian and factious one-sidedness? That something of this kind has been engendered by the abuses of journalism, can scarcely be denied, and its practical influence on our institutions and habits is already making itself felt to a dangerous extent. England, more than any other country, stands in need of a series of high-toned journals, open to the reception of truth, and determined to follow it courageously wherever it may lead, in the full conviction that whatever is, in nature, must be right. Whether in the present state of mind such journals would prove profitable speculations, is another, and an important, question—a question not wholly to be disregarded with impunity. Truth, we fear, has no party to back it; and, in order to procure friends, must still, as of old, be offered in homœopathic doses."

ANECDOTE OF WASHINGTON.

A person of lawless habits and reckless character had frequently entered upon the grounds near Mount Vernon, and shot ducks and other game. More than once he had been warned to desist, and not to return. It was his custom to cross the Potomac in a canoe, and ascend the creeks to some obscure place, where he could be concealed from observation. One day, hearing the discharge of a musket, Washington mounted his horse, and rode in the direction of the sound. The intruder discovered his approach, and had just time to gain the canoe and push it from the shore, when Washington emerged from the bushes at a distance of a few yards. The man raised his gun, cocked it, pointed it at him, and took deliberate aim; but, without a moment's hesitation, he rode into the water, seized the prow of the canoe, drew it to land, disarmed his antagonist, and inflicted on him a chastisement which he never again chose to run the hazard of encountering.—*Sparks's Life of Washington.*

DEPTH OF WELLS NEAR LONDON.

Wells 700 feet deep have been dug at Harrow-on-the-Hill, and several in London are between 200 and 300 feet deep; at other places on rising grounds the thickness of the stratum is much greater. In digging a well at Wimbledon for Lord Spencer, the workmen were obliged to go 530 feet before they came to the sand and gravel containing water. At Primrose Hill, near the Regent's Park, some years ago, the ground was bored to the depth of 500 feet without success. One mile east of London, the clay is only 77 feet thick; at a well in St James's Street it is 235 feet, and at High Beach 700 feet thick. In the spring of 1834 a water company sank a well on the lower heath at Hampstead, below the ponds, which was dry to the depth of 350 feet before reaching a supply of water, and even then the sand ran with the water in such a way as to make the steam-pump machinery nearly useless. It has already been observed that the ground rises from the north bank of the Thames—this it continues to do to the northern suburbs, Hampstead and Highgate. The ascent in town is in most places so gradual as to be scarcely perceptible; consequently the town is considered flat, and indeed it is so far level as to entail on the inhabitants an enormous expense in the proper construction and maintenance of shores and drains to meet the demands of common cleanliness, comfort, and even safety from disease; actual measurement, however, shows that the declivity is not only sufficient for this purpose, but that the difference of elevation in various parts of the town is very considerable.—*Dr Hogg's London as it is.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

STORIES OF THE IRISH PEASANTRY.

BY MRS S. C. HALL.

"Mind not high things: but condescend to men of low estate."
ST PAUL.

TOO EARLY WED!

"It's what I wanted to spake to yer honour about," said Sandy Donovan, who had entered my cousin's breakfast-room, and made her his best bow; "it's what I wanted, my lady, is the lend of a loan of two-and-sixpence, if it would be plasing to ye; and I'll work it out in any way convenient—either in going messages to the squire, or any where else in the three kingdoms at a moment's notice; or taking a hand at the knives, whin Mither Langan, or Mike, or the footboy himself, has no mind to be dirtin' their hands wid their work, and yer honor wantin' them to be clane before the quality; or driving the cows home, if the ould cowboy would be sick, or 'overtaken,' which will happen to any, let alone a boy of his years; or—but to be sure," added Sandy, after a pause, as if to give weight to some peculiarly onerous service he was about to proffer—"to be sure, yer honour nor the masther are never in trouble that way, like yer neighbours—if you war, bedad! there isn't a boy in the barony would bate the bailiffs wid grater joy than myself!"—and Sandy's eyes brightened, and his hand grasped more firmly the handle of his good shillala; he looked whay he really was, a fine handsome gay-hearted "boy" of about nineteen—certainly not twenty.

"Well, Sandy," replied my cousin, smiling, "I will lend you the half-crown; and you shall repay it me, not in labour—for I require my servants to do their own work—but in money."

"Och, ma'am dear, that's hard upon me intirely. I'd rather work it out."

"But isn't your time your money? Cannot you sell that time to some other person, and discharge your debt out of the produce?"

"I'm no scholar, my lady," he replied, twisting his shoulders, "but I'd rather work it out."

"We will speak of that by and bye," said my cousin; "you must pay me twopence a-week, and tell me what you want with the half-crown."

"Well, God bless you, my lady, I'm a made man; I'll pay it at the twopence, though I'd rather work it but, supposing even it came to double."

My cousin smiled at me significantly, for we had often talked of the impossibility of making an Irishman consider time as a commodity of value; and then she asked him, "Well, Sandy, and now tell me what you want with it?"

Sandy Donovan twirled his hat between his thumbs, looked down upon the carpet, and hemmed twice. I perceived at once the state of the case, for he blushed deeply. With the natural quickness of an Irishman, he saw I understood the matter; and turning to me, said, "If you please, my lady, tell the mistress, for I see you're insensed into it already."

"Sandy's in love!"

"I have known that for some time," answered my cousin, "and with the gate-keeper's daughter. But what has that to do with the half-crown?"

My cousin is one of those amiable, excellent persons, who, born though not brought up in the country, loving it also with the warmth of Irish love, can no more comprehend an Irishman's nature, than can those who, having paid a visit of two weeks to Dublin, and the county Wicklow, return with a self-satisfied conviction that they are fully acquainted with the habits, manners, and feelings of the Irish nation.

"Is it what has it to do with the half-crown, my lady?" repeated poor Sandy, to my infinite amusement; "why, thin, just every thing in life sure; it's to help pay Father Garratty for marrying us, my lady! We've made up the money all to that, mistress dear, and we didn't, that's I didn't, know what to do at all about it, until I thought I'd make bould with you, madam, that can feel for us."

"Me feel for you!" exclaimed my cousin, indignantly; "how could you fancy that?"

"Just, ma'am, the remembrance of your own young days, that to be sure you don't look past yet, long life to you, and the masther's too, when, as I have heard tell, you thought the great battle of Waterloo put betwixt you both for ever, and he kilt at it, though he's so hearty now; and sure if the want of the half-crown put betwixt me and Lucy Hackett, it would be as bad to us as the battle of Waterloo."

I never asked my cousin which of the two topics Sandy touched upon had softened her most—the sly compliment to her youthful looks, or the allusion to the "great battle" where her beloved husband had played a distinguished part. Certainly her after-observation had lost all asperity.

"Well, but, Sandy, what provision have you made for this new state of matrimony?"

"Provision is it, my lady?" answered Sandy, with another turn of his hat; "we've lots of love, mistress dear; it'll hould out till the grave shuts over us, I'll go bail for that."

"But, Sandy, you can't live on love?"

"It's cruel poor living without it—that I know, ma'am, any way," he replied right readily.

"But there will be two to feed instead of one at your father's; for Lucy cannot continue at the lodge."

"Nor doesn't want, ma'am—I've built her a cabin off the corner of my father's three acres, and there's a few sticks in it already. She's no great eater, and the pratees are cheap enough, thank God!"

"But, by and bye, you will have more than two to feed."

"Plase God," was Sandy's quiet reply.

"Sandy," I said, "I am sure your choice is a good one; Lucy is a pretty, cheerful, industrious little girl, not yet eighteen, I think—too young to take the heavy cares of peasant life upon her. I will not say she will change, because that is what Irish women seldom do; but I must say you are laying the foundation of certain misery, both for her and yourself, by not waiting until you have something to begin life with."

"Ah, thin, ma'am dear, it's a shame for ye to be evenin' sorrow to a bridegroom."

"You even it, as you call it, to yourself, Sandy; look there!" I pointed from the window to a beggar woman who was coming up the lawn, followed by a troop of children. "Look there! how would you like to bring the light-hearted fond girl you love to a fate like that? And yet such are the effects of very early marriages, combined with, or rather the first step to, imprudence. You are both young; labour in your several vocations for five or six years; you have much to love and labour for; and at the end of that period, by God's blessing on your own industry, you'll have something to begin with—enough to furnish a cabin comfortably, and a short purse to defray first expenses."

"But, ma'am dear, sure we can work as well together, and get the comfortable cabin and the short purse afther."

"No—you will not have the same motive; circumstances will bend you down. If Lucy becomes the mother of children at so early an age, her exertions will be cramped."

"She'd work the better," interrupted Sandy.

"She would be, as all Irish women are, the most affectionate mother in the world; but, marrying so young, old age will come upon her prematurely. Her eyes will grow dim, and her hair turn grey before her time; her bodily strength must fail; and what woman can knit, or spin, or sew for hire, with a tribe of little half-starved children round her feet! It is not too late to change your resolution. I will see Lucy; I will reason with her; I know she will wait for you. Work on singly a little longer. She will be your reward; and, believe me, such a prudential course will render your future life prosperous and happy."

"What can a young man save out of tiapence or a shilling a-day, my lady?" said Sandy.

"What could he spare at that rate for the support of a wife, what for the support of a family of children?"

"Bedad!" answered Sandy, twisting his shoulders, his invariable practice when in a hobble, "Bedad! I don't know; only they all does the same, and sure we'll be no worse off than our neighbours."

"But Lucy, poor pretty Lucy, who has been more tenderly brought up than her neighbours; surely, Sandy, you would not wish to bring her into trouble?"

"Poverty I may bring her to:—God help us, ma'am, there's none of us made up against that; but I'll work my fingers to the bone to keep her from trouble. I'll own she's too good for me; though that's not her own thought. But I'll say this: sorra a boy in the town land will make a better husband, let the other be who he may. Sure, ma'am, there's nothing in the poverty you think of, to frighten us. We've been looking at it ever since we war born, more or less. We get used to it, in these parts."

"You bring it on yourselves. Nothing keeps down either young man or woman so much as a tribe of infants before there is any thing to give them."

"Bedad, so it does," replied the young man, with the most perfect composure; "but how can we help it!—the craythurs ax nothing but pratees and salt, and grow up fine men and women on it, that flog the world for beauty."

In fact, in no shape could we place poverty so as to render her aspect more hideous than he knew it to be; but his naturally gay spirit rose against the idea that either Lucy or he was doomed to encounter it; or, if they were, he laid his thoughts upon the favourite phrase of those who are not able to help themselves, "We'll get over it, by the help of God!" or, "We'll not be worse off than our neighbours," or, "Something 'ill turn up for good." Sometimes he would parry my argument by wit, sometimes by laughter—always respectful, yet merry taunter; and so, seeing he was determined upon an early marriage, and consequent poverty, I resolved to appeal to Lucy.

"She's a great fool," said her grandmother at the lodge, who had brought her up; "but if the worst come to the worst, she'll be no worse off than her neighbours." Here was a pretty argument in favour of misery, by one who was old enough to have known better. "She'll sup sorrow for it, I daresay, but we all have our taste of it one way or other." Lucy was all smiles and tears. Sandy and she had learnt out of the same "Read-a-made-easy" at school; they had gone to their "duty" together. She had been promised to him, and no thought of any one else had ever come across her heart. She was willing to wait for him till the day of her death, only, may be, for any thing she could tell, it would be the same thing in five years as it was then—there was nothing to make it better—and the ould loved each other the more who spent their sunny days together. I knew full well there is comparatively little misery caused among the lower classes in Ireland by the want of connubial affection. Cottage trouble has its sweet consoling drop of love in the bottom of every cup of sorrow. Lucy seemed prepared for both. She did not attempt to deny that she loved Sandy, it "was so natural to love him; she never had a brother, and he had been more than a brother to her since she was the height of a rose bush." I could not look on the young beauty—so fair, so truthful, so earnest, so bright—without a feeling of deep grief, for I could not but anticipate what was to follow. She had not even the ambition which characterises the young English bride in the same sphere of life; she knew that poverty would be her dower, but she had made up her mind to encounter it with him she loved. "Her uncle," she said, "had promised them half an acre, or may be more, by and bye, and then they'd do 'bravely.'" "Why not wait for it?" "And sure we must wait for it," she replied, with

great naïveté, "for he won't give it to us now." In her quiet modest way, Lucy was as firm as Sandy. "You perceive," said my cousin, "persons who seek to intimidate them, by pointing out the miseries of poverty, fail; they see it so often, that they yield to rather than withstand it, or sometimes rather than avoid it, if the means of avoiding it disturbs their preconceived opinions."

"They are always acting from impulse rather than reason; they run into danger, and then ask you how they might have kept out of it," said I, sadly provoked with those foolish young persons.

"It is easy to see how it will end," observed my cousin.

"Can't you give them a little land to begin on?"

"My dear friend, if we were to give land to all the silly youths who marry without the prospect of even potato food from one day to another, we should not have an acre left for ourselves. These early marriages are sources of the great evils of Ireland, and can never be prevented, as long as the peasantry have no ambition to elevate themselves in the scale of society by means of better clothes and better dwellings than they generally possess. A man who is satisfied that his wife should beg while he reaps the English harvest, and that his children should go barefoot, cannot raise himself."

"But he is not so satisfied," I said; "necessity compels it."

"A necessity induced," observed my quiet cousin, "BY BEING TOO EARLY WED." She was quite right. I have heard of cases where absolute boys and girls have been wedded parents; and it is no uncommon thing to meet a grandfather in the very prime of life; I would not be thought an advocate for restraining, except to very reasonable bounds, the greatest blessing which the Almighty bestows upon his creatures—the power to be happy by making another happy. But I would have my humble fellow-countrymen and countrywomen more duly reflect before they adopt a course upon which nearly all, if not all, the comfort, and I may add integrity, of their after-lives must depend. If marriage has its consolations in adversity, and its endearments in prosperity, courtship also has both, besides a greater proportion of that which is the strongest and truest stimulus to exertion—HOPE! It excites also to economy, prudence, and sobriety, by a continual manifestation of their utility in bringing nearer the consummation of a dearly-cherished purpose; money will be saved, when an object is directly to be achieved by saving; labour will be undertaken with cheerfulness, when its recompense is clearly and distinctly seen; and, in short, the FUTURE will be perpetually in the eye, in the mind, and in the heart. On the other hand, poverty—too often the parent of sin—is always an effectual barrier against social improvement; prudence is shut out, when its beneficial influence is only remotely anticipated; and those who find it difficult to procure the necessities, never think of searching out the comforts, of life. My design, however, is to exhibit and illustrate evils less by precept than example; many will listen to a story who slumber over a sermon; and a picture may be made to speak more eloquently than words.

Five years had elapsed between the scene I have endeavoured to describe, and my once again visiting my native land; and greatly rejoiced was I once more to feel its bright green grass beneath my footsteps, to hear the music of its birds and rivers, and meet the welcome of bright eyes and warm hearts of many who had known me in childhood. During even so short a period, England had been galloping onwards to perfection; Ireland, I saw, had been creeping—and that is something—towards it also. Schools had been established, where education had never before been heard of; gardens had expanded around many cottages; the Sabbath day was more respected and hallowed than of old; and the dress both of men and women was neater and in better order. I certainly fancied beggars were on the increase, but this must have been only fancy. The truth was, I came from a land where they are comparatively unknown, and had almost forgotten how crowded my poor country always was with poverty-stricken creatures, who are unable to provide for themselves the commonest food or the coarsest apparel. Dublin is a solitary-looking city. The magnificence of its noble buildings badly accords with the emptiness of the broad streets. There is an air of desolation in its highways, a loneliness in its most public places:—

"The Greece, but living Greece no more."

You can hear the echo of your own footsteps in its noble squares; and the beggars know a stranger's face in the most crowded places. This beautiful city is almost a wilderness; and the occasional bursts of laughter that resound from the neighbourhood of College Green towards midnight, as the young men hasten to their apartments, have seemed to me strange and unnatural—out of keeping with the silence of the queenly yet solitary capital. We seek in vain for the trappings of its ancient state; few above the rank of gentlemen are to be encountered in its paths; and the palaces of its departed nobility—departed in a worse sense than that of death—ring to the sounds of the money-changers. You perceive, indeed, signs of traffic along the noble quays; corn and cattle may be seen there in abundance, but both are on their way to England; they pay no duty; the enormous and splendid Custom-house is therefore an assemblage of unfurnished apartments. The returns

of exports fill many a page in the quay-master's book; that for the entry of imports has but the single word *nil*. The corn and cattle are to be exchanged in British markets for money which the Irish farmer is not to see; it passes from the hands of the "driver" into those of the banker, to my Lord This and my Lord That, who learn twice a-year that they have tenants upon their hereditary estates in a place called Ireland, and who bestow upon the country just two thoughts—one upon each of the two occasions to which we make reference. My readers will find no politics in my sketches; but the topic on which I now write would give a pigeon gall. The absentees, who draw wealth out of Ireland and impart no single blessing in return, are responsible to God, and ought to be held responsible to man, for much of the misery and crime of which unhappily the country is so fertile. But this subject is one that requires greater space and attention than it can at present have; ere long I may be enabled to picture the system as I have seen it, and contrast the "landlord at home" with the "landlord abroad." Now, I must entreat my readers to follow me with my story.

It was a fine moonlight evening, and we had spent it with some friends residing in that immense square called Stephen's Green. We were walking homewards; and whatever cheerfulness we had imbibed under the hospitable roof of our host, was effectually dispersed by the shivering and half-starved creatures who asked our charity with an importunity which only their civility prevented from being offensive. One slight creature—a child clinging to her cloak, another slung at her back, and one resting on her bosom—had followed us nearly to the corner of Grafton Street, not begging with her tongue, but appealing to our feelings by many outward tokens of misery.

"If you want charity," said I, "why do you not ask it?"

"We are all dying for want of food," was the reply; and the voice, though I did not immediately remember to whom it belonged, thrilled through me like a strain of long-forgotten music.

"I have not tasted food all day," she continued, leaning against a projecting shop shutter, "nor wet my lips except with water; have mercy on me, for I am very young, and not used to begging."

"I believe you," I replied, for I had by that time recognised her voice; "I believe you; your name is Lucy Donovan." Poor, poor Lucy! She threw the hood back from her wasted features; she would have fallen on her knees at my feet, if I had not prevented her; her soft hair was matted across her brows; tears coursed each other down her cheeks; her nose was pinched by starvation; her lips, blue and trembling, could hardly give forth her thoughts—her prayers, I should rather say—for she appeared for a time to have forgotten her misery in the joy occasioned by the sight of a friend.

"To think, my lady, of my seeing you here!—and I conning over in my own mind yours and the mistress's warning about being too early married; it was the ruin of us all out sure enough; the childer came so fast, and nothing to give 'em. This is little Sandy, ma'am, the moral of his father; only you can't see him, the moonbeams are so pale. And the one at my back, little Thomas, after my poor father. Ain't I thankful that he never lived to see me in this trouble! And this little hungry girl is Anty, after my grandmother; sure I'm glad she's in heaven, too. Ah, ma'am, honey, a young loving heart must suffer a dale of sorrow before it blesses the grave for closing over, and the red worm for destroying, the things it loved more than life."

"Come to me to-morrow morning, Lucy," I said, "and we will see what can be done for you." I pressed a small donation and my address into her hand.

"I can't be out in daylight," she whispered; "I'll come at night—I've no clothes—nothing but the cloak left."

My English readers may believe this tale: it is no fiction; it is perfectly true; true, without an atom of exaggeration. The young mother had parted with every article of clothing she possessed in the world, except the thin blue hooded cloak, in which she enshrouded her misery and starvation: under its feeble protection she begged at night. I mentioned the circumstance to the lady at whose house we were residing. She assured me it was a fact of no uncommon occurrence.

The next night Lucy came with her children. We had provided something for her in the way of clothes.

"Won't you put on those shoes, Lucy?" "I thank you, my lady," she replied, while one of her old smiles brightened up her face; "I'll take them since ye're so good; but it's a bad fashion to be tendering my feet up with shoes; they're used to the stones now, poor things. And so best—"

"Where is Sandy, Lucy!—I cannot believe he has deserted you."

"God bless you for that right thought, my lady. He has not; he was forced to leave me, but that wasn't deserting me. You see, ma'am, after we married we got on very well for a bit; and the earnest true-hearted love we ever and always had for each other, held out wonderful; and I wasn't over strong, and poor Sandy took to working after hours, which every body knew he need not have done had he been single. But, any way, that brought on the fever. The fever, my lady, and this little Sandy, came together, before, indeed," she added, with her usual simplicity, "we were ready for either—to say ready; and then, between

nursing the husband and nursing the child, when I got up I had my hands full, and we both so young, and no experience. To be sure the poor neighbours helped us. They gave us a share of all they had, even to a handful of meal or a stone of potatoes; and the hardest word they ever spoke was, 'God direct you, ye poor young craythurs; ye married too soon.' Your cousin, ma'am, is a fine lady, and a good lady, but she put me ever and always in mind of how much better I might have been off had I remained single, which was true enough; and while my poor husband lay so bad intirely, the bitter taste of my folly was never off my lips. But when it pleased God, he grew better; and when I saw him once more able to raise his head to the sun, and to notice the baby, I forgot a dale of the bitterness, and thought it might pass away altogether. But it never did. If a young bird gets a hurt, my lady, in the nest, it never rightly recovers it. It was so with us. We began poor—we bargained for that; but the sickness that's born of poverty came on the top of it, and they both together crushed us. Well, ma'am dear, the gentleman where he worked when he got up again, took great pleasure in foreign parts, and couldn't afford to pay so many labourers, and Sandy was discharged. It's a poor case, ma'am, when the money scraped up in one country is taken clean away to spend in another. Sandy could have made out life alone, but another poor little babe had a mind to come into the world; so I could do nothing to help him. My grandmother (heaven be her bed!) was called from us, and she left me what she had to leave. Your cousin, my lady, said it would have been a fine thing to have had it if we war beginning life, but, coming in the middle of our trouble, when we war over and over in debt, it did us but little good, and melted away in a minute in rain, before we knew where it was. I could give to any; the neighbours war wonderful; but what could I do! My husband was the eldest of eleven, and he was to be cared on three acres of land, one of which was good enough for goose-grazing. I could knit, and I had plenty of knitting, and spinning, and I could make straw-bonnet making, but my hands war used with the two childer; and it pleased God to take the second in small-pox. It was a heart trouble to us then; and I thought the father would have broke his heart after it. The neighbours said it was well for us it was called, but somehow it's lonesome to want a baby's smile, or laugh, or even its cry, when ye're used to it, and have little else to comfort you; and, despite her misery, the mother's eyes filled with tears, and little Sandy saw them, and he lifted up his dirty face to kiss her; the never exhausted mine of Irish affection was already at work in the boy's heart. "We struggled on, and this babe was born. We had been put above the world, in regard of debt, by my grandmother's death; and one morning Sandy said, 'It's no use slaving on and starving as we're doing, Lucy. I had an offer yesterday when I was driving Abby Leary's creels; and if you're the heart to hear it, I'll tell it ye.' And I clenched my hands, and set my teeth, as if it was death I expected, for I guessed that his mind was set on foreign parts. But I didn't gainsay him, though I was right. He promised to send me word, and money to bring me and the childer out to him, and I waited at home; and three months after he went, this last craythur was born."

"To add to your trouble," I said.

"No," she answered, pressing it to her bosom; "it helped me to put the trouble over; it has the very eyes and smile of my poor Sandy."

"How foolish," I thought, "it is to attempt to sound the depth of woman's love! What fine feelings there were beneath that cloak—crushed by circumstances that must ever crush those who, without any provision, too early wed!" "At last," she continued, "I grew ashamed to stay longer in my own place; I couldn't beg there—I couldn't go there, from door to door, or stop those I met to ask for food or halfpence. I locked up the door of the cabin, put the key in the thatch, left word with a neighbouring woman that they could send to his uncle near Dublin any letter that came from him, and begged my way here. The poor always helped me on my journey, and I was easier moving from place to place—it seemed as though I was getting nearer Sandy; but I've had no letter; those more used to this life than me, get more than I do—I pray, instead of beg. Bit by bit, I lost every shred of clothes. But my worst trouble is, that my early marriage has brought these darlins into a world of trouble, from which I have no power to deliver them; and though I have loved to look at them, yet, often, dear my lady, when I have seen them staggering with hunger, I could have knelt in the cold snow, and cursed my folly. Wicked thoughts have come into my head then, and I have had no peace until I prayed to God to cool my poor burning brow, and cleanse the badness from my heart. I have one hope still—HE may DIE—but he will never forget us. If we can live over the present time, a letter may come; but the weakness is upon my heart when I think either of fresh joy or more sorrow. I walked the length of Stephen's Green after yer honours last night, but the dryness of my parched throat hindered me from speaking. Since yer ladyship spoke to me last night, I have had fresh hope, but, somehow, I'm afraid to hope, for after it trouble comes stronger. I've not been able to go after a letter to his uncle's; I've been ashamed; but, please God, there's no need of that now, the Lord reward ye all! though I

it's more than we deserve. Who knows—there may be comfort for us yet." She smiled, but there was a ghastliness in the smile that made me shudder; it was the smile of a corpse, rather than of a living woman. The poor infants devoured the food we gave them; and when they were satisfied, she ate, but not till then; nothing could exceed her gratitude; the past seemed almost forgotten, after her story was told—a story of simple suffering, with no strong incident to rivet the attention, no powerful event to work upon the imagination—nothing but a tale of Irish misery, brought on, not by misconduct, but a want of that carefulness, that "long-headedness," which makes the Irish peasant a beggar, and the simple possession of which lays the foundation of Scotch and English independence. My story, if so it may be called, is not finished.

Lucy had been worn to a skeleton by anxiety and starvation. I saw she could not live; our succour came too late; she was dying—dying at the very age, when, if she had followed our advice, she might have married in sure anticipation of happiness, and with a reasonable prospect of prosperity. I went to see her; for little Sandy had told me, with tearful eyes, "that though mammy had plenty to eat, and new milk to drink, she was too sick to come out." She was lingering in that hectic fever which scorches up, by slow degrees, the moisture of existence; the baby, too, was dying. "I am sure," she said, "there is a letter from Sandy at his uncle's." I found out the place; she was right. How she screamed, and how her skeleton fingers quivered, when she saw it! "I knew if he was in life, he would not forget us," she said.

The poor fellow was full of hope; and though his feelings were roughly expressed, they were there, warm from his affectionate but imprudent heart; the next letter was to bring money—but a little, yet some; and the one after would bring them all out to him. And she heard all this; and at first, when I read, the flush was bright on her cheek, and then it faded; and she called little Sandy, and said, "You hear—it is from your own daddy, my boy;" and then I thought a slight convulsion moved her features. She grasped the poor soiled paper, the record of his affection; pressed it to her lips; another convulsion; her fingers stiffened round it—SHE WAS DEAD!

LORD BROUGHAM'S NEW WORK.

"DISSERTATIONS on Subjects of Science connected with Natural Theology," is the title of a new work by Lord Brougham, in two volumes; being the conclusion of the new edition of Paley's work, undertaken by his lordship, in conjunction with Sir Charles Bell. The subjects treated are Instinct, the Origin of Evil, Cuvier's Researches in Fossil Osteology, and the Principia of Newton. The first subject, which occupies the whole of the first volume, is the one in which the public is likely to be most interested. It is treated in the form of a dialogue, the supposed speakers being Lord Brougham and Earl Spencer (lately Lord Althorp), who are described as meeting at the country residence of the former nobleman, soon after the election of the first parliament of Queen Victoria. Nor are the speakers alone supposed, for we are informed in the preface that such conversations have taken place between Lords Brougham and Althorp, and that their respective opinions are here, upon the whole, faithfully represented.

Lord Brougham endeavours throughout to show that instinct is something essentially different from reason, and he would almost appear to be of opinion that it is something higher, as he can only account for the certainty and precision of its proceedings by supposing that they are immediately prompted by the Deity, reason being, on the other hand, only an instrument for effecting divine intentions. He chiefly cites the bee in illustration of his doctrines. "I perceive," says he, "a certain thing done by this insect, without any instruction, which we could not do without much instruction. I see her working most accurately without any experience, in that which we could only be able to do by the expertness gathered from much experience. I see her doing certain things which are manifestly to produce an effect she can know nothing about; for example, making a cell and furnishing it with carpets and with liquid, fit to hold and to cherish safely a tender grub, she never having seen any grub, and knowing nothing of course about grubs, or that any grub is ever to come, or that any such use, perhaps any use at all, is ever to be made of the work she is about. Indeed, I see another insect, the solitary wasp, bring a given number of small grubs and deposit them in a hole which she has made, over her egg, just grubs enough to maintain the worm that egg will produce when hatched—and yet this wasp never saw an egg produce a worm—nor ever saw a worm—nay, is to be dead long before the worm can be in existence—and, moreover, she never has in any way tasted or used these grubs, or used the hole she made, except for the prospective benefit of the unknown worm she is never to see. In all these cases, then, the animal works positively without knowledge, and in the dark. She also works without designing any thing, and yet she works to a certain defined and important purpose. Lastly, she works to a perfection in her way, and yet she works without any teaching or experience. Now, in all this she differs entirely from man, who only works well, perhaps at all, after being taught—who works with knowledge of what he is about—who works, intending and meaning, and,

in a word, designing to do what he accomplishes. To all which may be added, though it is rather perhaps the consequence of this difference than a separate and substantive head of diversity, the animal works always uniformly and alike, and all his kind work alike—whereas no two men work alike, nor any man always, nay any two times, alike. Of all this I cannot indeed be quite certain as I am of what passes within my own mind, because it is barely possible that the insect may have some plan or notion in her head implanted as the intelligent faculties are: all I know is the extreme improbability of it being so; and that I see facts, as her necessary ignorance of the existence and nature of her worm, and her working without experience, and I know that if I did the same things I should be acting without having learnt mathematics, and should be planning in ignorance of unborn issue; and I therefore draw my inference accordingly as to her proceedings."

On the other hand, Lord Althorp leans to the opinion that there are two kinds of mind, with different qualities, one being made so that it can act rationally, knowing and intending all it does, the other so that it acts without knowing or intending. He supposes a general law, by virtue of which the solitary wasp, for instance, has a desire to carry exactly the number of caterpillars required for feeding her worms after they are born. So the bee, he says, may form her hexagons and rhomboids, in consequence of a gratification felt by a fore-ordained law of her nature, in following those lines and angles, and no other. The views of Lord Althorp are certainly the more philosophical.

From the immediate consideration of instinct, the noble lords pass to the subject of animal intelligence, of which an immense variety of anecdotes are given, many old and some new. We shall endeavour to enliven our paper with some of those which appear the most curious, or are least generally known.

"Lord Althorp. Before quitting the bee, the ant, and the wasp, let us just observe their rational acts. They are nearly as notable as their instinctive ones. The bee, upon being interrupted by Huber in her operations, shortened the length of her cells; diminished their diameter; gradually made them pass through a transition from one state to another, as if she was making the instinctive process subservient to the rational; and, in fine, adapted her building to the novel circumstances imposed upon her; making it, in relation to these, what it would have been in relation to the original circumstance if they had continued unaltered. It is found, too, that the ant, beside the wonderful works which she instinctively performs, has the cunning to keep aphides, which she nourishes for the sake of obtaining from them the honey-dew forming her favourite food, as men keep cows for their milk, or bees for their honey."

Lord Brougham. On this discovery of Huber some doubt has lately been thrown; and do not let us trouble ourselves with any thing at all apocryphal, when the great body of the text is so ample and so pure. But the expeditions of a predatory nature are by all admitted. They resemble some of the worst crimes of the human race; the ants undertake expeditions for the purpose of seizing and carrying off slaves, whom they afterwards hold in subjection to do their work; so that the least significant and the most important of all animals agree together in committing the greatest of crimes—slave-trading."

A. With this material difference, that the ant does not pharisaically pretend to religion and virtue, while we bring upon religion the shame of our crimes by our disgusting hypocrisy. But the wasp, too, shows no little sagacity as well as strength. Dr Darwin relates an incident, to which he was an eye-witness, of a wasp having caught a fly almost of her own size; she cut off its head and tail, and tried to fly away with the body, but finding that, owing to a breeze then blowing, the fly's wings were an impediment to her own flight, and turned her round in the air, she came to the ground and cut off the fly's wings one after the other with her mouth. She then flew away with the body unmolested by the wind."

B. I have myself observed many instances of similar fertility of resource in bees. But perhaps the old anecdote of the jackdaw is as good as any—who, when he found his beak could not reach the water he wanted to drink, threw into the pitcher pebble after pebble till he raised the surface of the liquid to the level of his beak. Lord Bacon tells it of a raven filling up the hollows in a tree where water had settled."

A. Or the crows of whom Darwin speaks in the north of Ireland, who rise in the air with limpets and mussels, to let them fall on the rocks and break them, that they may come at the fish. It is said that animals never use tools, and Franklin has defined man a tool-making animal; but this is as nearly using tools as may be—at least, it shows the same fertility of resources, the using means towards an end."

B. Perhaps the most remarkable of all proofs of animal intelligence is to be found in the nymphs of water moths, which get into straws, and adjust the weight of their case so that it can always float—at least, Mr Smellie says that when too heavy they add a piece of straw or wood, and when too light a bit of gravel. If this be true, it is impossible to deny great intelligence to this insect."

A. Why should we doubt it? The crow in rising and letting the mussel fall, shows as great knowledge of gravitation as the moth in this case."

B. But an old monkey at Exeter 'Change, having

lost his teeth, used, when nuts were given him, to take a stone in his paw and break them with it. This was a thing seen forty years ago by all who frequented Exeter 'Change, and Darwin relates it in his *Zoonomia*. But I must say that he would have shown himself to be more of a philosopher had he asked the showman how the monkey learned this expedient. It is very possible he may have been taught it, as apes have oftentimes been taught human habits. Buffon, the great adversary of brute intelligence, allows that he had known an ape who dressed himself in clothes to which he had become habituated, and slept in a bed, pulling up the sheets and blankets to cover him before going to sleep; and he mentions another which sat at table, drank wine out of a glass, used a knife and fork, and wiped them on a table-napkin. All these things, of course, were the consequence of training, and showed no more sagacity than the feats of dancing-dogs and bears, or of the learned pig—unless it were proved that the ape on being taught these manipulations became sensible of their convenience, and voluntarily, and by preference, practised them—a position which no experiments appear to support. Smellie, however, mentions a cat which, being confined in a room, in order to get out and meet its mate of the other sex, learnt of itself to open the latch of a door; and I knew a pony in the stable here, that used both to open the latch of the stable and raise the lid of the corn chest—things which must have been learnt by himself, from his own observation, for no one is likely to have taught them to him. Nay, it was only the other day that I observed one of the horses taken in here to grass, in a field through which the avenue runs, open one of the wickets by pressing down the upright bar of the latch, and open it exactly as you or I do."

A. I have known, as most people living in the country have, similar instances, and especially in dogs."

B. But there is one instance of animals catching their prey in a way still more like the tool-making animal. I do not allude merely to the spider's web, or to the pelican's use of his large open pouch in fishing, but to an American bird, of which you find a curious account in the *Philadelphia Transactions*. It is called the *newn-totter* by the Germans, as we should say, the *vine-killer*, and is found to catch grasshoppers and spear them when dead upon twigs where the small birds come on which it feeds; for the grasshoppers themselves it never touches. These are left, generally about nine in number (from whence its name), the whole winter, and they attract the birds of which the animal in question makes its prey. This is really using one creature as a bait, in order thereby to decoy and catch another."

After an account of the ingenuity of the beaver, Lord A. proceeds—

"There seems reason to suppose that other animals still preserve their sagacity and act in concert. No one can have observed a flock of pigeons without perceiving that they have sentinels posted to give the alarm. Indeed, wilder birds act in like manner. Fieldfares, when they are occupying a tree which you approach, remain steady and fearless until one at the extremity rises on her wings and gives a loud and very peculiar note of alarm, when they all get up and fly, except one who continues till you get near, as if she remained to see that there really was occasion for the movement, and to call them back if the alarm proved a false one. She too at length flies off, repeating the alarm-note."

B. In the forests of Tartary and of South America, where the wild horse is gregarious, there are herds of five hundred or six hundred, which, being ill prepared for fighting, or indeed for any resistance, and knowing that their safety is in flight, when they sleep, appoint one in rotation who acts as sentinel, while the rest are asleep. If a man approaches, the sentinel walks towards him as if to reconnoitre or see whether he may be deterred from coming near—if the man continues, he neighs aloud and in a peculiar tone, which rouses the herd, and all gallop away, the sentinel bringing up the rear. Nothing can be more judicious or rational than this arrangement, simple as it is. So a horse, belonging to a smuggler at Dover, used to be laden with run spirits, and sent on the road unattended to reach the rendezvous. When he descried a soldier, he would jump off the highway and hide himself in a ditch, and when discovered, would fight for his load. The cunning of foxes is proverbial; but I know not if it was ever more remarkably displayed than in the Duke of Beaufort's country, where Reynard, being hard pressed, disappeared suddenly, and was, after strict search, found immersed in a water pool up to the very snout, by which he held a willow bough hanging over the pond. The cunning of a dog, which Sergeant Wilde tells me of, as known to him, is at least equal. He used to be tied up as a precaution against hunting sheep. At night he slipped his head out of the collar, and, returning before dawn, put on the collar again, in order to conceal his nocturnal excursion. Nobody has more familiarity with various animals (besides his great knowledge of his own species) than my excellent, learned, and ingenious friend, the Sergeant, and he possesses many curious ones himself. His anecdote of a drover's dog is striking, as he gave it me, when we happened, near this place, to meet a drove. The man had brought seventeen out of twenty oxen from a field, leaving the remaining three there mixed with another herd. He then said to the dog, 'Go, fetch them;' and he went

and singled out those very three. The Serjeant's brother, however, a highly respectable man, lately sheriff of London, has a dog that distinguishes Saturday night, from the practice of tying him up for the Sunday, which he dislikes. He will escape on Saturday night and return on Monday morning. The Serjeant himself had a gander which was at a distance from the goose, and hearing her make an extraordinary noise, ran back and put his head into the cage—then brought back all the goslings one by one, and put them into it with the mother, whose separation from her brood had occasioned her clamour. He then returned to the place whence her cries had called him." * *

A. Dogs show the greatest talents in learning. The feats of pointers, but still more of shepherds' dogs, after making all the deductions you have mentioned, are astonishing. It almost seems as if the shepherd could communicate, by sign or by speech, his meaning, when he desires to have a particular thing done. But assuredly the dog takes his precautions exactly as he ought, to prevent the sheep from scattering, and to bring back runaways. Indeed, greyhounds and other dogs of chase, as well as pointers backing one another, show the adaptation of, and variation in, the means used towards an end.

B. Retrievers exceed all other dogs in this respect. There was one died here a year or two ago that could be left to watch game till the keeper went to a given place, and she would then join him after he had ranged the field; nay, could be sent to a spot where game had been left, and where she had not been before. Indeed, she did many other things which I have hardly courage to relate.

A. How were her pups? I have always found such extraordinary faculties hereditary.

B. My worthy, intelligent, and lamented friend, T. A. Knight (so long president of the Horticultural Society), has proved very clearly that the faculties of animals are hereditary to such a point as this. He shows that even their acquired faculties—the expertness they gain by teaching—descends in the race. His paper is exceedingly curious. But I think we need hardly go so far as to his minute details for proof of the fact. It is found that where man has not been, no animals are wild and run away from his approach. When Bougainville went to the Falkland Islands (or, as the French call them, the Malouines), he found himself and his men immediately surrounded by all kinds of beasts and birds, the latter settling on their shoulders. No navigators had ever been there before. Lord Monboddo says that the same thing had been related to him by navigators. It seems clear, then, that the running away from man, which seems natural to all wild animals in or bordering upon inhabited countries, is an acquired propensity, transmitted to the descendants of those whose experience first taught it them as necessary for their safety.

A. Have you Knight's paper here? I know the accuracy of his observation to equal his great ingenuity.

B. To that I too can bear my testimony. Here is his principal paper, read lately before the Royal Society. It is given as the result of his observations and experiments, made for a period of sixty years; it is therefore most justly entitled to great respect. He chiefly dwells on the case of springing spaniels, and among other instances gives this, which is indeed very remarkable. He found the young and untaught ones as skilful as the old ones, not only in finding and raising the woodcocks, but in knowing the exact degree of frost which will drive those birds to springs and rills of unfrozen water. He gives the instance, too, of a young retriever, bred from a clever and thoroughly taught parent, which, being taken out at ten months old, with hardly any instruction at all, behaved as well and knowingly as the best taught spaniel, in rushing into the water for game that was shot, when pointed out to it, however small, bringing it, and depositing it, and then going again, and when none remained, seeking the sportsman and keeping by him. He imported some Norwegian ponies, mares, and had a breed from them. It was found that the produce 'had no mouth,' as the trainers say; and it was impossible to give it them; but they were otherwise perfectly docile. Now in Norway, draught horses, as I know, having travelled there and driven them, are all trained to go by the voice, and have no mouth. Again, he observed that they could not be kept between hedges, but walked deliberately through them—there being, he supposes, none in the country from which their dams came.

A. Does he speak of any other animal?

B. Yes, he mentions his observation on woodcocks, which he could remember having been far less wild half a century ago; for on its first arrival in autumn, it was tame, and chuckled about if disturbed, making but a very short flight, whereas now, and for many years past, it is very wild, running in silence and flying far. He gives an instance of sagacity in a dog, unconnected with hereditary intelligence. He one day had gone out with his gun and a servant, but no dog. Seeing a cock, he sent the servant who brought this spaniel. A month afterwards he again sent for the same dog from the same place. The servant was bringing him, when at twenty yards from the house the spaniel left him, and ran away to the spot, though it was above a mile distant. This he often repeated, and always with the same result, as if the animal knew what he was wanted for."

In the theoretical section respecting Animal Intelligence, the two lords nearly agree that the difference between the minds of brutes and men is only one in degree, not in kind.

In thus describing the most important section of Lord Brougham's book, and giving some specimens of the many curious facts which are brought together in that section, we have accomplished our main end. In the way of general remark, we have only to add, that the whole manner of the argument leaves on our minds a strong feeling of dissatisfaction. What, after all, have we here, or any where else, on this subject, but a collection of manifestations, theorised upon merely with reference, and in subserviency to, a number of preconceived notions? Lord Brougham is actually so much under prejudice, that, in judging of the very nice operations of the bee, he allows himself to be biased by the consideration that the human mind gives no similar power—as if the world of mind were necessarily bounded by our consciousness. On this footing, we should like to see the bee set up as a metaphysician, and deny that there could be such a thing as imagination under the control of natural laws, merely because there was no such thing felt by it to exist, though it had the testimony of a whole library of fiction laid before it. But we are not surprised that even so clever a person as Lord Brougham gives no satisfactory light on these subjects. He and the whole class of inquirers to which he belongs, obstinately overlook the principal, and perhaps the only true or philosophical means of ascertaining the natural character of mind, and its diversities in different species—a careful study of the nervous system. There is not one allusion to organisation in this book, as if the organs which the Deity has charged with the performance of the mental functions of his creatures were something to be ashamed of. A treatise on digestion, in which the stomach was not once alluded to, could not be a greater absurdity. Until Lord Brougham shall have paid at least as much attention to this subject as he evidently has to the dead and forgotten systems of the Scottish metaphysicians, he will never, we can safely predict, clear up the perplexed question of instinct, or any other connected with mental science.

OCCASIONAL NOTES.

MENTAL DISEASE.

WHEN insanity manifests itself, there is usually a great reluctance in the relatives of the party affected to place that individual in an asylum. There is, in the first place, perhaps, an unwillingness to part with an endeared relative. There may also be a hope that the disorder will prove susceptible of a speedy cure at home. But the most powerfully operative feeling usually is, a decided unwillingness to give the case the importance which a visit to an asylum is held to infer. It appears like breaking the character of the party, to send him or her to an asylum, seeing that a person who has once been under treatment in such a place, is ever after, however far a recovery may be effected, looked upon as a person declaredly liable to insanity, and who is therefore unfit to be trusted in many of the more important social relations. The consequences of this reluctance to resort to the aid offered in asylums, are of a very fatal kind. Insanity is a disorder which, like all others, is most easily cured in its earliest stages. It is also one which, whether early or late, can only be treated well by persons who have studied it carefully, and nearly, if not altogether, made its treatment their profession. So also it requires for its cure, that the patient be placed in certain circumstances, such as can only be realised in some place set apart for the purpose. To keep an insane person, then, in a family, under common treatment, is to give him a chance of cure much less than what he would have under the systematic regimen of a well-conducted asylum; it most probably allows a disease to take root, which, well treated at first, would have been soon removed; and perhaps, after all, domestic treatment having failed, the patient has to be sent to an asylum, in a condition which leaves the hope of cure, even there, very small indeed.

While such are the ordinary evils apt to arise from the keeping of insane relatives at home, there are others to be dreaded from the ungovernable feelings which sometimes possess the insane. Instances of dreadful violence committed by them, or only evaded or repressed with great difficulty, are far from uncommon. The following anecdote, which we know to be perfectly true, will illustrate what we mean. In York, some years ago, a gentleman and lady, in the relation of brother and sister, kept house together. The gentleman was liable to occasional fits of madness, but had never been placed in an asylum for medical treatment. One day, when he and his sister were about to sit down to dinner, he took up the carving-knife, and told his sister that a sudden thought had occurred to him: he thought that her head would make an exceedingly nice bottom-dish at table, and he had therefore resolved to cut it off, and place it there. The lady, observing a particular appearance of excitement in his eye, had no doubt of his being in earnest. Concealing her alarm, she tried to laugh at what he said as a joke, but he soon informed her that it was no jest which he meant. "Come," said he fiercely, "make ready." "Well, then, George," said she, "if you will do so, I suppose you must do it; but don't you think it would be proper that my head should have its best cap on, when placed in the dish. I will go to my room, and

put it on, and come back immediately." The madman was checked for a moment by this speech. She took advantage of the pause, moved past, and rushed towards her room, which chanced to be on the same floor. George was instantly at her heels, but she had time to get in and bolt the door. She then called for assistance from a window, while her brother was thundering without. Several persons immediately entered the house, and secured the madman, who was that night sent to an asylum, where he was in time cured by proper treatment.

The root of the evil which is the subject of the present note, is to be found in the erroneous ideas entertained respecting insanity, and asylums for the insane. A strangely painful feeling is always connected with these things, the result, we cannot help believing, of an unphilosophical notion as to mental disease, and of the wretched manner in which asylums were formerly conducted. In reality, mental disease is only disease: it is an affection of organic parts, quite as much as scurvy or consumption. It is also capable of being ministered to, with a view to its cure, in all respects as other maladies are. Asylums are, or ought to be, nothing more or less than infirmaries for this class of diseases. They stand apart, because it is a class of diseases requiring appropriate buildings; in this there is nothing more remarkable than in the separation of a fever-ward from a common hospital. The ordinary notions, implanted by such descriptions as Harley's visit to Bedlam in the Man of Feeling, are all of them inapplicable to such establishments in the present day. We are inclined to think that much harm is done by such descriptions in fictitious literature, and also by the terms commonly used to describe asylums. The word *mad-house* is, to our ears, one of the most horrible of vulgar barbarisms. The connection of the word "lunatic" with asylums is little better. The feelings raised by those appellatives operate immensely in causing persons of the ordinary world to shrink from committing their insane relatives either to public or private asylums. They should all of them be abolished, and a phraseology substituted in accordance with a just view of mental disease, and with the humanity of the age.

Were this recommendation followed—were the importance of early treatment in asylums better known—we have little doubt that these institutions would be more generally resorted to, and a material deduction made from the amount of evil experienced in consequence of mental disease.

A FEW WEEKS ON THE CONTINENT.

CONDITION OF BELGIUM.

A STAY of a few days in Brussels impressed us with a very favourable opinion of it as a place of residence. Both in external aspect, and in a number of social peculiarities, it bears a marked resemblance to Paris; but the people here, and in some other places in Belgium, are much more like the English than the French. The Belgians are an active and business-minded people, and, though lively enough in their manner, evidently are not wanting in the solid qualities requisite for the mercantile character. Those whom we see in such towns as Brussels cannot be distinguished from English in any thing but their language—they may be called an English people speaking French—while those in the country, who form the Flemish part of the population, are remarkable for their old-fashioned steady habits, like their brethren the boors of Holland.

It is a fact well ascertained by minute statistical inquiry, that the agricultural population of Belgium are at this moment among the most contented, virtuous, and generally comfortable peasantry in the world. The farms are for the most part of a small size, just sufficient to pay a moderate rent, and support a family in a humble but decent manner. Among a people who would disregard the dictates of prudence, such a mode of small farming would speedily cover the soil with a swarm of paupers; but among the Flemings no such result ensues. The too rapid increase of population is checked by the universal desire to marry only when the subsistence for a family can be readily and honestly obtained by industry. Conversing on this subject at Brussels with M. le Comte Arrivabene, we were informed by that gentleman that he had resided for eleven years in a village called Gaesbeck, in the province of Brabant, containing 364 inhabitants, and that during the whole of that period neither a crime nor a culpable indiscretion had been committed. The greater part of the inhabitants are renters and cultivators of land to the extent of five or six acres each family; and this, with a cottage and garden, is quite enough to render them comfortable. They are all Roman Catholics, and exceedingly devout. Their piety, however, does not make them gloomy and morose: they have fifteen holidays throughout the year, exclusive of Sundays; and these they partly devote to dancing and out-of-door amuse-

ments. The food of this cheerful, industrious, and religious people, is of a very simple kind. It consists of coffee with bread early in the morning; bread, butter, and cheese, at nine o'clock; potatoes with lard at noon; in the evening a salad with bread; and occasionally there is a little beer.*

I heard every where that the rural population of Belgium are greatly under the dominion of the priests, who thus have it in their power to affect the returns of members to the legislature, and indirectly control the government. I was further assured that the clergy were opposed to a national system of education on the broad and liberal basis of that in Holland, and that therefore there was little chance of a law to that effect being passed. The priests, it is mentioned, fear that any extended process of instruction will undermine the present virtuous and contented habits of the peasantry; and this, I believe, is their only real motive for objecting to the measure. Meanwhile, education is by no means extinct or feebly conducted in Belgium. William, while governing the Netherlands, did much to promote the extension of primary schools, and these institutions may now be considered as fixed in the country. Whatever may be the momentary effect of the opposition of the priests, I feel certain, from all that came under my notice, that nothing short of political convulsion can now permanently restrict the improvement of Belgium in all branches of its social condition.

In Brussels, there is a considerable number of schools, some of which are on a very extensive scale, more like universities than preparatory seminaries for youth. After having visited two of the principal establishments of this nature, I sought out certain schools of a humble order, with the view of comparing them with what had come under my attention in Holland. I shall describe one of them. It is an "Ecole primaire gratuite," or charity school of primary instruction, supported by the town for the benefit of the poorer class of children, and is situated in an alley leading from one of the main thoroughfares. At the period of my visit it contained 500 children of both sexes; the boys, who are most numerous, occupying the lower, and the girls the upper floor. The whole is under the direction of a head master, M. Zuyten, who, with the greatest good will, explained to me the nature of the instruction which is given. The rows of forms are arranged the same as in Holland, by which all the children look one way; the masters have no seats; and on the sloping bench in front of each scholar, there is a slate sunk or fixed in the wood, so that no slates can be tossed about or broken. The branches of instruction are reading in French and Flemish, grammar, writing, arithmetic, geography, and drawing, to which are added explanations by the master respecting the familiar phenomena of nature. As all the children are of the Roman Catholic persuasion, the church catechism, and simple lessons of a pious nature, are taught in the school, the business of thorough instruction in religion being left to the clergy in after years. The books in use contain much useful knowledge of a simple kind, and inculcate, among other social duties, the necessity of politeness or civility, also cleanliness and order; all which admonitions are further explained and illustrated in a practical manner by the teacher. Both here and in the Dutch schools, habits of propriety and cleanliness are strictly enforced, not only in but out of doors. I regret to say that I do not know a single school in Scotland in which there are any express injunctions delivered on this point, or any surveillance exercised beyond the doors of the establishment. The parents being in most cases equally negligent, the consequences are such as will not bear description. The deficiencies of our instruction in these respects contrast very unfavourably with what comes under the inspection of the visitor to the Dutch and Flemish schools and households. The inculcation of habits of personal cleanliness, and of civility, or good manners, as we would term it, forms one of the most pleasing traits of the course of instruction in the Netherlands.

The only thing that struck me as peculiar in this large school was the method of instruction in drawing. It has been already mentioned that we saw the children in a school at Haarlem amusing themselves with drawing figures on their slates, either from copies on the walls, or according to their own fancy. There was in this, however, nothing systematic, and perhaps it will prove of little benefit to the pupils. The plan is very different at Brussels; all the children are taught to draw in a most systematic manner. Along the walls of the school are hung up large sheets covered with printed diagrams, commencing from the simplest geometrical figures up to complex designs. The pupils—little fellows of six and seven years—are taught

to draw these figures, naming them as they proceed, on a large black board with chalk and compasses. Each pupil, alternately, is thus allowed to exhibit as a monitor, while those not actually operating on the board try to follow the designs on a smaller scale on their slates. By these means, both freedom of execution and facility in copying are attained. The object desired is not to make the pupils accomplished draughtsmen, for that can only be done by the study of the rules of perspective in more advanced years, but to teach them the forms of objects according to the principles of geometry, and to accustom them to handle the implements used in drawing. In the girls' class, a similar method of teaching is pursued; but in their case the instructions are chiefly confined to the drawing of ornamental forms for patterns in sewing. M. Zuyten stated that, when the boys brought up in this school went to mechanical employments, for which almost all of them were destined, they found great practical benefit from their drawing lessons; especially such as became stone-masons, carpenters, and house-painters. "As for the girls," he continued, "Brussels is celebrated for its manufacture of lace; and how can we maintain our superiority in that species of fabric, unless our young women are initiated in the principles of design?" These explanations seem so reasonable and conclusive, that they require no comment.

Every thing considered, the degree of prosperity of Belgium at the present time is very remarkable. At the revolution which separated them from the Dutch, they lost almost the whole of the trade carried on with the colonies of the Netherlands, as these colonies reverted to Holland, to which the large India vessels henceforth proceeded. For about two years after the revolution of 1830, the external commerce of the country languished, but the reduction of the citadel of Antwerp, and the opening to them of the navigation of the Scheldt, soon changed the face of affairs. To make this clear, it may be mentioned that, in 1829, the year preceding the revolution, the number of vessels which entered the port of Antwerp was 1031, and the number is now above 1400 annually; the same proportional increase being observable at the only other seaport, Ostend. Without a single colony, the commerce of Belgium is daily extending. At present the annual value of the external commerce of the kingdom is equal to 360 millions of francs, of which 210 millions are imports, and 150 millions are exports. The total burden of vessels entering the ports of Belgium in 1836, amounted to 232,535 tons.

Symptoms of the revival and establishment of manufactures are observable in many places in Belgium, but few are seen any where in Holland. The Dutch are a sagacious and most respectable people—their orderliness, industry, and cleanliness, are beyond all praise; they are, however, at present not an advancing, or, on the whole, a thriving people. What may be the true causes of this, it would, perhaps, be presumptuous in me to say. My impression is, that there is little genius or enterprise amongst them; at least, they seem to have no idea of readily adopting and employing mechanical expedients with the view of enlarging the bounds of manufacturing industry, while their inordinate self-esteem as a nation (nourished to an improper extent in their school instruction), prevents them from imitating those who are fit to set them an example. Satisfied with their usages, their industry, and all that belongs to them, they remain the same yesterday, to-day, and for ever. Their towns never seem to grow any larger, their canals and roads are what they were a hundred years since, and, excepting some little additional energy in education, I am not aware of any advance they are making on a general scale. In short, they are a nation in *stereotipe*—a work upon which few or no corrections or improvements can be permitted.

Belgium presents a totally different spectacle, and one leading reason for this is probably the greater political freedom of the country. Holland is bowed to the earth with taxation; the human mind is oppressed with the spirit of methodic system. Belgium suffers comparatively little from taxation, and the hand of every one is free to pursue that line of industry which his heart desireth. Except at Haarlem, I do not remember seeing in Holland any tall brick chimnies in connection with steam-engines for the manufacture of tissue fabrics. Now, there are many of these emblems of manufacturing industry in Belgium. In Ghent, I observed several of late erection in connection with establishments over whose doors were painted the words "Katoen Spinnerij." The following scraps of information, gathered from works which I procured in Belgium, will convey a tolerable idea of the present state of the manufactures of the country.

Woolen tissues, once the staple of the Netherlands, now employ annually about 14,000,000 francs' worth of foreign wool, to which may be added 200,000 francs' worth of wool of native growth. The woolen cloths are now preferred to the French, and those of black dye are in colour superior to the English. The principal manufactories are those of Verviers, Liege, Dolhain, Hodimont, Stavelot, Thuin, Poperinghe, and Ypres. In the year 1833, the returns of the Belgian Chambers showed that in Verviers alone, 40,000 workmen were employed, the products of their labour amounting to 25,000,000 francs. Stuffs, such as flannels, serges, camlets, &c. are manufactured in all the provinces, but particularly in Antwerp and in Hainault.

The manufacture of carpets is likewise considerable. The manufactory of Messrs Schumacher, Overmann, and Co., at Tournay, is one of the finest in Europe; 1600 workmen are there constantly occupied. The quantity manufactured annually in this establishment amounts to more than 120,000 metres, 7-8ths of which are for exportation. Other carpet manufactories exist on a smaller scale in Brussels, Antwerp, Ghent, Bruges, and Courtrai.

Flax is one of the principal agricultural products of Belgium, and brings a high price in the foreign markets, on account of its excellent quality. It is raised principally in Flanders, Brabant, and Hainault. The provinces of East and West Flanders produce annually flax to the amount of 40,000,000 francs. The linen of Flanders is still held in high esteem, the climate being apparently well suited for its manufacture; nearly all the cities of the lower provinces manufacture it in abundance, but the productions of the looms of Bruges and Courtrai are considered the most beautiful, and sell for the highest price. Mr J. Cockerill has lately established at Liege a steam-loom linen factory, in which a 90-horse power engine is employed. In the year 1836, the returns showed a great increase in the quantity of linen sold in the Belgian markets; the total of the produce of the looms in Belgium in that year amounted to 750,000 pieces, of the value of nearly 100,000,000 of francs. In the manufacturing of flax alone, there are upwards of 400,000 persons employed, or a tenth of the entire population.

The manufacture of cotton goods is increasing rapidly, in consequence of the general introduction of the best kinds of machinery, and of steam power. The cotton manufactures give employment in Antwerp and Flanders to 122,000 workmen, and absorb a capital of sixty millions of francs; the total value of the manufactured articles amounts annually to eighty-four millions of francs.

The feeding of silk worms, and the preparation of silk, is a trade also on the increase. The silk fabrics now manufactured in the country are esteemed for their good qualities, and already the exports of these tissues into France exceed the imports from that country. The provinces of Antwerp and Brabant contain the principal silk manufactories. The quantity of native silk produced in 1837 amounted to 1991 kilogrammes.

The lace of Belgium has been always admired for its texture, and the beauty of the flowered work. Very beautiful lace, as already mentioned, is made in Brussels in the establishment of Messrs Dupeptiaux and Co. Lace of a secondary order is made in abundance in the provinces of Antwerp and Flanders. In Mons there is a lace school, designed to carry the workers to the highest degree of perfection in the manufacture of this article. The tulles, or fine-net gauzes, of Belgium, are in great request in foreign countries. The tambour and fine-sewing work gives employment to upwards of 50,000 females. Above two millions of francs' worth of lace and tulles are annually exported.

The mechanical ingenuity of the Belgians is particularly observable in the manufacture of cabinet work and elegant house-furniture. The cabinet manufactories of Brussels are very extensive, and the articles which are there made, are noted for their elegance and solidity. Immense quantities are annually exported to England, Germany, and America. The Dutch are so completely behind in works of this description, that fine house-furniture cannot be procured at any price in Rotterdam. The tables and chairs of houses furnished in a comfortable manner are imported from London.

The ingenuity of the Belgians equally enables them to excel in coach-making. Immense quantities of vehicles of an elegant kind are now made for home use, and for exportation into foreign countries. The hackney-coaches and chaises in Brussels, and other towns, also the railway carriages, are as neat and comfortable as any made in England. The French are very much behind in the construction of all sorts of vehicles.

The manufacture, at Liege, of steam-engines, locomotive machines, power-looms, muskets, and other articles of iron, has already been adverted to; also the cutlery of Namur. In Liege and its environs, including Namur, there cannot be fewer than 20,000 men employed in the iron trade. Machinery is now also fabricated in Brussels, Charleroi, Bruges, Nivelles, Tirlemont, Hérné, and Yve. At Charleroi nearly 6000 workmen are employed in the manufacture of nails.

The porcelain works of Belgium are now in a thriving condition, and the quality of the articles manufactured rivals those of England, Saxony, and France.

Sugar-refining is carried on, upon a very extensive scale, in many parts of the kingdom. The quantity exported from Ghent alone, in 1836, amounted to 3,998,320 kilogrammes.

The business of beer-brewing is now carried on to a considerable extent. The number of breweries amounts to 2500, and a large portion of their produce is exported. The best beers are made at Lembeck, Brussels, Louvain, Diest, and Hoegaerde. Immense quantities of spirits are also annually exported.

The manufacture of paper is rapidly improving, by the introduction of paper-making machines and English workmen. The books printed at Brussels are now upon as good paper as the greater part of London publications. In this respect alone, the Belgians are a century in advance of the Dutch. All the school

* The Count Arrivabene has contributed a paper to one of the English Poor-Law Reports, describing at large the condition of the Flemish peasantry.

treatises and other works of native produce which came under my attention in Holland, are printed in a very coarse style upon hand-made paper, of as coarse a quality as that which is used in England for wrapping up tea and sugar. Perhaps the reader may smile when I suggest that the condition of a country may be pretty well known by the number and variety of its printed placards on the walls. In the towns up the Rhine, few samples of this species of literature meet the eye. You may see a theatre bill, or something else of a trifling kind, but no variety of intimations such as one observes in England. In Holland the press is so completely under surveillance, that every placard and handbill is taxed and stamped like a newspaper. The walls, therefore, except on the great occasions at the fairs, or when there is to be a sale of colonial produce, exhibit few printed affiches. Not so in Belgium. The walls of Brussels are gaudy with placards, making announcements of sales of all kinds, the publication of books, the establishment of schools, the opening of places of amusement, and a thousand other things. Printed paper is, in short, seen every where; and whatever may be said of the religious bigotry of the Belgians, it is perfectly clear that they have shot considerably ahead of the Dutch, as respects books, newspapers, and all the other products of the press.

Such is a rough sketch of the principal branches of manufacture now established in Belgium. The variety and extent of the manufactures are daily increasing, for not only are the people active and skilful in the pursuits to which they direct themselves, but the government is animated by the keenest desire to encourage the progress of all branches of industry. National expositions, as they are called, or public exhibitions of new manufactures, have been instituted, and take place annually at Brussels; and at these, gold and silver medals are awarded to a large amount. A satisfactory proof of the increase of manufacturing establishments in Belgium, is afforded by the number of authorisations or licences which were issued between 1830 and 1838. In the province of Antwerp, the number of authorisations for the establishment of manufactures was 171, in Brabant 259, in West Flanders 209, in East Flanders 159, in Hainault 698, in Liege 260, in Namur 57, in Limburg 129, and in Luxembourg 20; making a total of 1962 new manufactures, in which are constantly to be found in operation 400 steam-engines.

The improvement of agriculture, fisheries, mining, and other departments of industry, is keeping pace with the advance of manufactures. In the Museum of Arts at Brussels, I observed a variety of the implements of husbandry, according to the latest improvements in Britain—something very different from the show of antiquated rubbish which came under my notice in the collection at Utrecht. On the coast of Belgium are found skate, plaice, soles, turbot, whiting, smelts, a small species of cod, sardines, and crabs. The outward fisheries consist principally of cod, herrings, and oysters. For this distant sea fishery 200 vessels are employed. The cod introduced to the country by the Ostend vessels amounted in 1837 to 8175 tons.

The mines form an important department of national industry. There are three mining districts; the first, which comprehends Hainault, contains 150 mines in a superficial extent of 102,415 hectares (the hectare is nearly two-thirds of an English acre); the second, which extends to the provinces of Namur and Luxembourg, contains 95 mines in an extent of 30,030 hectares; and the third, which embraces the provinces of Liege and Limburg, contains 138 mines in an extent of 32,777 hectares. The principal mineral riches consist of coals, of which Hainault produces more than the whole of France. The coal mines of Mons, Charleroi, Liege, and Marimont, furnish annually 3,200,000,000 kilogrammes; besides which, there are many other mines of less importance. In 1836, 31,190 workmen were employed in 230 coal mines, and the products were estimated at 32,000,000 francs; while in France, where similar mines might be worked with extraordinary success, there are but 198 in operation, employing 17,500 miners, and producing annually about 19,000,000 francs. Iron mines abound in the southern provinces in conjunction with those of coal. Copper is principally found in Hainault and Liege; lead in the latter, Namur, and Luxembourg; zinc in Namur, Hainault, and Liege; and pyrites, celomine, sulphur, and alum, in Liege and Namur.

The whole country included between the frontier of France and a line supposed to be drawn from Ostend to Arlon (including the province of Liege), abounds in marble, slate, hewing stone, and lime. Large quantities of marble are quarried, some specimens of which are exceedingly beautiful. The black marble of Denant is of great value and in high request.

In concluding these details respecting the raw and manufactured products of Belgium, it is necessary, for the completion of the picture of national prosperity, to revert to the improved mode of communication by railways, which, as already mentioned, is still only in its infancy. In a few years, should no untoward event occur, a considerable traffic will be carried on through Belgium with Germany, instead of as at present through Holland and the Lower Rhine. The Dutch, in pertinaciously appropriating or contending for the navigation of the Maas, will shortly find themselves, as respects the commerce of Germany, in possession of a barren privilege, and never will the world have witnessed such a striking example of the triumph of

science and enterprise over narrow-mindedness and greed. Independently of any advantage which Belgium may derive from this anticipated trade with the upper regions of Germany—laying its railways entirely out of the question—it is indisputable that it will speedily prove, if it is not already, a formidable rival to England both in manufactures and commerce. In the manufacture of many articles, it has already attained an equal skill; in returns from this source it must already be not far behind Great Britain, in proportion to its size and population. Taking its efforts in conjunction with those of its Prussian neighbours, we may be perfectly assured of the fact, that the long-boasted supremacy of England in all kinds of industrial operations is about to pass away, or at least to be divided with other countries.

THE HEROINES OF BURNS.

THIRD AND CONCLUDING ARTICLE.

DURING the three years he spent at Ellisland, Burns was so deeply engaged in the labours of his farm and those connected with his appointment in the Excise, that he had little of either time or inclination for the cultivation of his poetical gift. Yet, even in this busy time, he contrived to celebrate the charms of one or two local divinities. One of these was Miss Jeffrey, daughter of the minister of Lochmaben: spending an evening at the manse, he was greatly pleased with this young lady, who did the honours of the table; and he next morning presented at breakfast the lines which have made her immortal—

"I gae'd a waeft' gate yestreen,
A gate, I fear, I'll dearly rue;
I gat my death frae twa sweet een,
Twa lovely een o' bonnie blue.
'Twas not her golden ringlets bright;
Her lips like roses wat wi' dew,
Her heaving bosom, lily-white—
It was her een sae bonnie blue.
She talk'd, she smil'd, my heart she w'd;
She charm'd my soul—I wist na how;
And aye the stound, the deadly wound,
Cam frae her een sae bonnie blue.
But spare to speak, and spare to speed;
She'll ablin listen to my vow:
Should she refuse, I'll lay my dead
To her twa een sae bonnie blue."

Miss Jeffrey married a gentleman named Renwick, and accompanied him to New York, where, we presume, she still resides. Mr George Thomson, in the second edition of his *Scottish Melodies* (1830), gives an interesting note respecting her. "The editor's son," says he, "who happened to be at New York about eight years ago, gave him the following gratifying account of her, and of what fell from her respecting the Poet. 'I was introduced to Mrs Renwick by her son, the Professor of Chemistry in Columbia College. She is a widow—has still the remains of Burns's delightful portrait of her: her *twa sweet een*, that gave him his death, are yet clear and full of expression: she has great suavity of manners and much good sense. She told me that she often looks back, with a melancholy satisfaction, on the many evenings she spent in the company of the great bard, in the social circle of her father's fireside, listening to the brilliant sallies of his fine imagination, and to his delightful conversation. 'Many times,' said she, 'have I seen Burns enter my father's dwelling in a cold rainy night, after a long ride over the dreary moors. On such occasions one of the family would help to disencumber him of his drenching and boots, while others brought him a pair of slippers, and made him a warm dish of tea. It was during these friendly visits that he felt himself perfectly happy, and opened his whole soul to us, repeated, and even sang many of his admirable songs, and enchanted all who had the good fortune to be present with his manly luminous observations and artless manners. I never,' she added, 'could fancy that Burns had ever followed the rustic occupation of the plough, because every thing he said or did had a gracefulness and charm that was in an extraordinary degree engaging.'"

About 1791, a young English lady, named Miss Deborah Davies, resided in Dumfriesshire. She was the youngest daughter of Dr Davies of Tenby in Pembrokeshire, and related by marriage to some of the best Dumfriesshire and Galloway families: her eldest sister had married the Honourable Adam Gordon, a younger brother of the present venerable Lord Kenmore. She was highly educated and accomplished, a writer of verses, extremely witty and agreeable, and an exquisite beauty, though of rather small stature. Some complimentary imagination called her one of the Graces in miniature. Burns met this young gentleman, and, as might be expected, was greatly delighted with her. Recalling the structure and burden of an old song, he thus wrote about her—

"Bonnie wee thing, cannie wee thing,
Lovely wee thing, wert thou mine,
I wad wear thee in my bosom,
Lest my jewel I should tine.
Wishfully I look and languish
In that bonnie face o' thine;
And my heart it stounds wi' anguish,
Lest my wee thing be na mine.
Wit, and grace, and love, and beauty
In ae constellation shine;
To adore thee is my duty,
Goddess o' this soul o' mine!"

Bonnie wee thing, cannie wee thing,
Lovely wee thing, wert thou mine,
I wad wear thee in my bosom,
Lest my jewel I should tine!"

Afterwards, in a more elaborate attempt to do justice to her, he informs us that the tuneful powers which whisper inspiration must make an effort beyond all former efforts, before they can faithfully depict the charms of this exquisite creature.

"Each eye it cheers, when she appears,
Like Phoebus in the morning,
When past the shower, and every flower
The garden is adorning. * *
Her smile's a gift, frae 'boon the lift,
That makes us mair than princes;
A sceptred hand, a king's command,
Is in her darting glances. * *
My muse to dream of such a theme
Her feeble powers surrender;
The eagle's gaze alone surveys
The sun's meridian splendour:
I wad in vain essay the strain,
The deed too daring brave is;
I'll drap the lyre, and mute admire,
The charms o' lovely Davies."

We learn from a nephew of the lady, through a note in Mr A. Cunningham's edition of Burns, that in her case, as in so many others, "wit, and grace, and love, and beauty," all failed to secure for Miss Davies a happy fate. Her story, as related by Mr C., is extremely touching:—"It was the destiny of Miss Davies to become acquainted with Captain Delany, who made himself acceptable to her by sympathising in her pursuits, and by writing verses to her, calling her his 'Stella,' an ominous name, which might have brought the memory of Swift's unhappy mistress to her mind. An offer of marriage was made, and accepted: but Delany's circumstances were urged as an obstacle; delays ensued; a coldness on the lover's part followed; his regiment was called abroad, he went with it; she heard from him once and no more, and was left to mourn the change of affection—to droop and die. He perished in battle, or by a foreign climate, soon after the death of the young lady, of whose love he was so unworthy."

The following verses on this unfortunate attachment form part of a poem found among her papers at her death: she takes Delany's portrait from her bosom, presses it to her lips, and says,

"Next to thyself, 'tis all on earth,
Thy Stella dear doth hold;
The glass is clouded with my breath,
And as my bosom cold:
That bosom which so oft has glowed,
With love and friendship's name,
Where you the seed of love first sowed,
That kindled into flame.
You there neglected let it burn,
It seized the vital part,
And left my bosom as an urn
To hold a broken heart;
I once had thought I should have been
A tender happy wife,
And passed my future days serene
With thee, my James, through life." * *

We now arrive at the not less remarkable story of the "Chloris" of Burns. About the time when the poet came to Ellisland, Mr William Lorimer, a substantial farmer, came to reside at Kemmis-hall, a farm on the opposite side of the Nith, about two miles nearer Dumfries. Mr Lorimer, like many other tenants of the Duke of Queensberry, had realised some wealth in consequence of an extremely favourable lease, and he now, in addition to farming, carried on extensive mercantile transactions in Dumfries and at Kemmis-hall. It was in consequence of his dealing in teas and spirits that he fell under the attention of the poet, who then protected the revenue interests in ten parishes. Burns became intimate with the Lorimers. They scarcely ever had company at their house, without inviting him; they often sent him delicacies from their farm; and whenever he passed their way on his professional tours, Mrs Lorimer was delighted to minister to his comforts with a basin of tea, or whatever else he might please to have. A daughter of the family recollects seeing many letters of his addressed to her father: one contained only the words, "Coming, sir," a quaint answer, probably, to some friendly note of invitation. No fiscal visitor was ever so liked as he; but then he was the most good-natured of such visitors—of which one little circumstance, recollected by the person above mentioned, may be sufficient proof. Having arrived one evening, and having, without Mrs L.'s knowledge, put up his horse in the stable, he came in by the back entrance, and so into the kitchen, where the lady was busy in the preparation of a considerable quantity of candles for home consumption—

† From above the sky.

‡ Several other ladies about this time received the compliment of a song from Burns, but little can be said of them. The "Bonnie Jean" of the song beginning "There was a lass and she was fair," was Miss M'Murdo, daughter of a gentleman who resided at Drumlanrig, as land-agent for the Duke of Queensberry, on his grace's Dumfriesshire estates. To Miss Janet Miller, daughter of his landlord Patrick Miller of Dalavint, and afterwards wife of John Thomas Erskine, who became thirteenth Earl of Mar, he addressed the song, "Wilt thou be my dearie?" Mrs Oswald of Auchincruive, who died of consumption soon after the poet, was the heroine of "Oh, wat ye wha't in yon town?" He has also two songs on Miss Phillis M'Murdo, a younger sister of Bonnie Jean. The M'Murdos were all beauties, and the family is still remarkable for an unusual share of personal loveliness.

candles being then an excisable article. He looked not—he stopped not—but, only remarking, "Faith, ma'am, you're thrang to-night," passed hastily on to the parlour.

Mr Lorimer's eldest daughter Jean was at this time a very young lady, but possessed of uncommon personal charms. Her form was symmetry itself, and, notwithstanding hair of flaxen lightness, the beauty of her face was universally admired. A Mr Gillespie, a brother officer of Burns, settled at Dumfries, was already enslaved by Miss Lorimer; and to his suit the poet lent all his influence. When it is mentioned that the young lady had been born at Craighieburn, a mansion romantically situated amidst beautiful woods near Moffat, the strain of the following song, which he wrote in Gillespie's behalf, will be understood:

"Sweet closes the evening on Craighie-burn-wood,
And blithely awakens the morn;
But the pride of the spring in the Craighie-burn-wood
Can yield to me nothing but sorrow.
I see the spreading leaves and flowers,
I hear the wild birds singing;
But pleasure they have none for me,
While care my heart is wringing.
I canna tell, I maunna tell,
I darena for your anger;
But secret love will break my heart,
If I conceal it langer.
I see thee graceful, straight, and tall,
I see thee sweet and bonnie;
But oh, what will my torments be,
If thou refuse thy Johnnie!
But, Jeanie, say thou wilt be mine,
Say thou lo'es nane before me;
And a' my days o' life to come
I'll gratefully adore thee."

This pleading was in vain, and Miss Lorimer became the wife of another, under somewhat extraordinary circumstances. About this time, a young gentleman named Whelpdale, connected with the county of Cumberland, and who had already signalled himself by profuse habits, settled at Barnhill, near Moffat, as a farmer. He was acquainted with a respectable family named Johnston at Drummerieff, near Craighieburn, where Miss Lorimer visited. He thus became acquainted with the young beauty. He paid his addresses to her, and it is supposed that she was not adverse to his suit. One night in March 1793, when the poor girl was still some months less than eighteen years of age, and of course possessed of little prudence or knowledge of the world, he took her aside, and informed her that he could no longer live except as her husband: he therefore entreated her to elope with him that very night to Gretna Green, in order that they might be married, and threatened to do himself some extreme mischief if she should refuse. A hard-wrung consent to this most imprudent step fixed her fate to sorrow for life. The pair had not been united for many months, when Mr W. was obliged by his debts to remove hastily from Barnhill, leaving his young wife no resource but that of returning to her parents at Kemmis-hall. She saw her husband no more for twenty-three years!

Though Burns had now removed to Dumfries, his intimacy with the Kemmis-hall family was kept up—and, let it be remarked, he was not intimate with them merely as an individual, but as the head of a family, for his wife was as much the friend and associate of the Lorimers as himself, though perhaps less frequently at their house. When Jean returned thither in her worse than widowed state, she was still under nineteen, and in the full blaze of her uncommon beauty. It was now that she became more particularly a heroine of the Ayrshire poet. She became so under the appellation of Chloris—a ridiculous appellation of the pastoral poets of a past age, but which, somehow, does not appear ridiculous in the verse of Burns. He is found in September 1794—at which time she was exactly nineteen—celebrating her in the following imperishable stanzas—the passion of which must, however, be understood as merely ideal, and expressed under favour of the poetical licence—

"Sae flaxen were her ringlets,
Her eyebrows of a darker hue,
Bewitchingly o'er-arching
Twa laughing een o' bonnie blue.
Her smiling sae wiling,
Wad make a wretch forget his woe;
What pleasure, what treasure,
Unto these rosy lips to grow:
Such was my Chloris' bonnie face,
When first her bonnie face I saw,
And aye my Chloris' dearest charm,
She says she loes me best of a'.
Like harmony her motion;
Her pretty ancle is a spy
Betraying fair proportion,
Wad make a saint forget the sky.
Sae warming, sae charming,
Her faultless form and graceful air;
Ilk feature—and nature
Declared that she could do nae mair.
Hers are the willing chains o' love,
By conquering beauty's sovereign law;
And aye my Chloris' dearest charm,
She says she loes me best of a'.
Let others love the city,
And gaudy show at sunny noon;
Gie me the lonely valley,
The dewy eve, and rising moon:
Fair beaming, and streaming,
Her silver light the boughs among;

While falling, recalling,
The amorous thrush concludes his sang:
There, dearest Chloris, wilt thou rove
By wimpling burn and leafy shaw,
And hear my vows o' truth and love,
And say thou loes me best of a'!"

About the same time he composed in her honour the sweet pastoral song of "Lassie wi' the lint-white-locks," and in a letter to Mr Thomson, dated October 19, he speaks of her in the following whimsical terms:—"She is one of the finest women in Scotland, and in fact (entre nous) is in a manner to me what Sterne's Eliza was to him—a mistress, or friend, or what you will, in the guileless simplicity of Platonic love. Whenever I want to be more than ordinary in song; to be in some measure equal to your diviner airs, do you imagine I fast and pray for the celestial emanation? Touts au contraire. I have a glorious recipe; the very one that, for his own use, was invented by the gods of healing and poetry, when erst he piped to the flocks of Admetus. I put myself on a regimen of admiring a fine woman; and in proportion to the adorability of her charms, in proportion you are delighted with my verses." To the same letter he adds a postscript, mentioning that, since the above was written, he has been dining with a friend in the country, where he met with his muse, Chloris. In returning home, he says, he got into song, and composed, with reference to her, what has always appeared to us as one of the very finest of all his songs—that beginning,

"Sleep'st thou, or wak'st thou, fairest creature?
Rosy morn now lifts his eye,
Numbering ilka bud, which Nature
Waters wi' the tears o' joy:
Now thro' the leafy woods,
And by the reeking floods,
Wild Nature's tenants freely, gladly stray;
The lintwhite in his bower
Chants o'er the breathing flower,
The lavrock to the sky
Ascends wi' sangs o' joy,
While the sun and thou arise to bless the day."

In the ensuing month, the enthusiastic poet is found composing a fifth song on Mrs Whelpdale—

"My Chloris, mark how green the groves,
The primrose banks how fair;
The balmy gales awake the flowers,
And wave thy flaxen hair,"—&c.

He then implores Mr Thomson to send him one copy of his Collection, to be presented to this divinity. After all, we find Burns, in the ensuing May, writing an impassioned song "On Chloris being ill," and still further extolling her charms in a sixth song, "Twas na her bonnie blue ee was my ruin," in which the name is changed to Mary. As some amends for such persevering attention to the charms of another besides his wife, we discover, in the same letter to Mr Thomson, the song entitled "Caledonia," in which he makes so graceful an allusion to his Mauchline mistress and spouse. The measure of Mrs Whelpdale's poetical honours was not yet, however, full. In the early part of 1795, he made her the heroine of a song beginning, "Mark yonder pomp of costly fashion;" of another much finer, "O bonnie was yon rosy brier;" and of still another, being the ninth, beginning, "Forlorn, my love, no comfort near." In all these effusions the reigning sentiment is love, that fictitious passion which Burns describes in the letter to Mr Thomson. We may admire the poetry, but we can have little interest in the feeling. Very different is it with a modest set of verses which the bard inscribed on a copy of his poems presented to Mrs Whelpdale: he is there only the kind friend, deploring her misfortunes and endeavouring to whisper comfort:

"Tis Friendship's pledge, my young, fair friend,
Nor thou the gift refuse,
Nor with unwilling ear attend
The moralising muse.
Since thou, in all thy youth and charms,
Must bid the world adieu,
(A world 'gainst peace in constant arms),
To join the friendly few.
Since thy gay morn of life o'ercast,
Chill came the tempest's lower;
(And ne'er misfortune's eastern blast
Did nip a fairer flower).
Since life's gay scenes must charm no more,
Still much is left behind;
Still nobler wealth hast thou in store—
The comforts of the mind!
Thine is the self-approving glow,
On conscious honour's part;
And, dearest gift of heaven below,
Thine friendship's truest heart.
The joys refin'd of sense and taste,
With every muse to rove:
And doubly were the poet blest,
These joys could he improve."

Some years after this outpouring of verse on her account, the father of Mrs Whelpdale became unfortunate, and ceased to be the wealthy man he had once been. The tuneful tongue which had sung her praise, and lamented her sorrows, was also laid in silence in Dumfries churchyard.* She continued to derive no

* Burns, in his latter years, alluded to Mrs Elidell of Woodleigh Park in the song, "Wert thou in the cauld blast," and "Canst thou leave me thus, my Katy?" He celebrated Miss Lesley Baillie (now Mrs Cumming of Logie) in "Saw ye bonnie Lesley?" And Miss Jessy Lewars (now Mrs Thomson, Dumfries) in the heroine of the exquisite song "Here's a health to aye I loe dear," besides one or two others.

income from her husband, and scarcely even to know in what part of the world he lived. She was now, therefore, compelled to accept of a situation as plain governess, in which capacity she passed some years in various respectable families in different parts of Scotland. Some time in the year 1816, in returning from a visit to her brother in Sunderland, she inquired at Brampton, near Carlisle, for her husband, and learned that she had only missed seeing him by a few hours, as he had that day been in the village. He was now squandering some fourth or fifth fortune, which had been left to him by a relation. Not long after, learning that he was imprisoned for debt at Carlisle, she went to see him. Having announced to him her wish for an interview, she went to the place where he was confined, and was desired to walk in. His lodging was pointed out to her on the opposite side of a quadrangle, round which there was a covered walk, as in the ambulatories of the ancient religious houses. As she walked along one side of this court, she passed a man whose back was towards her—a bulky-looking person, slightly paralytic, and who shuffled in walking, as from lameness. As she approached the door, she heard this man pronounce her name. "Jean!" he said, and then immediately added, as under a more formal feeling, "Mrs Whelpdale!" It was her husband—the gay youth of 1793 being now transformed into a broken-down middle-aged man, whom she had passed without even suspecting who he was. The wife had to ask the figure if he was her husband, and the figure answered that he was. To such a scene may a romantic marriage lead! There was kindness, nevertheless, between the long-separated pair. Wrongs so great as the blight of a whole life cannot well be forgiven; but we can impose a truce upon our bitterest feelings. What passed in the minds of these two beings respecting each other, can never be known, and it would not be easy to hazard a conjecture on such a subject. It is certain that Jean spent a month in Carlisle, calling upon him every day, and then returned to Scotland. Some months afterwards, when he had been liberated, she paid him another visit; but his utter inability to make a prudent use of any money entrusted to him, rendered it quite impossible that they should ever renew their conjugal life. After this, she never saw him again.

The subsequent life of the "Lassie wi' the lint-white locks" was spent in Edinburgh, in a degree of obscurity which leaves us to suppose that her circumstances were very humble. We believe the highest employments by which this unfortunate lady endeavoured to sustain life, were little superior to those of an ordinary domestic. She never ceased to be elegant in her form and comely of face; nor did she ever cease to recollect that she had been the subject of some dozen compositions by one of the greatest modern masters of the lyre. About the year 1825, a benevolent gentleman to whom she had made her penury known, bestowed himself in her behalf, and represented her case in the public prints, with the hope of drawing forth a little money for her relief. His wife, having sent her some newspapers containing the paragraphs which he had written, received the following note, in which we cannot help thinking there is something not unworthy of a poetical heroine:

"Burns's Chloris is infinitely obliged to Mrs — for her kind attention in sending the newspapers, and feels pleased and flattered by having so much said and done in her behalf.

Ruth was kindly and generously treated by Doan; perhaps Burns's Chloris may enjoy a similar fate in the fields of men of talent and worth.

March 2, 1825."

The lady here addressed saw Mrs Whelpdale several times, and was greatly pleased with her conversation, which showed considerable native acuteness of understanding, and a play of wit such as might have been supposed to charm a high intellect in one of the opposite sex. Afterwards, our heroine obtained a situation as housekeeper with a gentleman residing in Newington, and there she lived for some time in the enjoyment, she said, of greater comfort than she had ever known since she first left her father's house. But a pulmonary affection of a severe nature gradually undermined her health, and she was ultimately obliged to retire to a humble lodging in Middleton's Entry, Potterrow, near the place where Burns had first met with Clarinda. Here she lingered for some time in great suffering, being chiefly supported by her late master; and here, in September 1831, she breathed her last. Her remains were interred in Newington burying-ground. Her husband, who latterly lived at Langholm in Dumfriesshire, on a small pension, survived her three or four years.

Poor Chloris is a sad memento of the evils which spring to women from one rash step in what is, for that sex, the most important movement in life. Life was to her clouded in its morn; every grace that heaven gives to make woman a charm and a solace to man, was possessed in vain; all through this false step, taken, though it was, at a time when she could scarcely be considered as responsible for her own actions. Alas, how many fair creatures of equal promise come through one chance and another to bitterness! Yet, while there are hearts that can forgive error, and pity its consequences, while there are souls capable of appreciating poetry not ill-named divine, must the name of this unfortunate woman remain with her fellow-creatures.

USEFUL ANIMALS OFTEN DESTROYED AS HURTFUL.

[From a volume entitled "The Rights of Animals, and Man's Obligation to Treat them with Humanity." By William H. Drummond, D.D. London: John Mardon. 1838.]

MULTITUDES of animals are most unmercifully destroyed from ignorance of their uses, from an idea that they are noxious or injurious to some petty concern of a field or garden; and at the very time they are rendering important services to man, they are mowed down as if they were his sworn enemies, and had conspired against his life. Hence the rooks in some parts of England were at one time in danger of being extirpated, as we learn from the author of "A Philosophical Survey of the Animal Creation." "The rook," says he, "is a species of crow that feeds upon worms produced from the eggs of the May-bug. As these and all the winged insects in general are to be supported by the roots of plants, they deposit their eggs pretty deep in the earth, in a hole they dig for that purpose. The worms and caterpillars upon which the rook feeds, are not exposed to the mercy of this bird till the earth is thrown up. Hence it is that rooks always frequent lands recently cultivated, that the sight of the husbandman with his plough puts them in action, and that they search with so much assiduity about furrows newly formed.

Some years ago the farmers in one of the principal counties of England entertained a notion that these birds were prejudicial to their grain, and they determined, as if with one accord, to extirpate the race. The rooks were every where persecuted; their nests demolished; their young ones destroyed. But in proportion to the decrease of this animal, they found themselves overrun with swarms of worms, caterpillars, butterflies, and bugs, which attached themselves to the grain, trees, and fruits, and occasioned greater desolation in one day than the rooks would have done in the space of a twelvemonth. Many farmers were ruined. At length the persecution ceased; and they found that in proportion as this race of animals was restored, the scourge which their destruction had occasioned ceased likewise.

To this authority may be added that of Selby, who, in his "Illustrations of British Ornithology," p. 73, affirms that "wherever the banishing or extirpating of rooks has been carried into effect, the most serious injury to the corn and other crops has invariably followed, from the unchecked devastations of the grub and the caterpillar. In Northumberland I have witnessed their usefulness in feeding on the larvæ of the insect commonly known by the name of *Harry-long-legs* (*Tipula oleracea*), which is very destructive to the roots of grain and young clover."

This is a very instructive history. It should be made universally known; and at the same time it should induce men to examine well whether many of the creatures against which they wage an exterminating war, may not be among their benefactors. Notwithstanding, crows still continue to be the objects of remorseless persecution. Will it be believed that in the month of June, in the year of our Lord 1838, "William Evans, of Trefargoed, in company with another farmer, on Monday sc'ennight, killed 1915 crows in Pantyderi-wood, Pembrokeshire, from three to six o'clock in the evening?" Of the motive to this massacre we are not informed, but it was probably from the mistaken idea that these birds were enemies to agriculture; an idea of which some minds seem incapable of being dispossessed. The American farmers of New England once offered a reward of threepence per head for the heads of the purple grackle, because it took a little of the grain to which it had an equitable claim, for its services in preventing the depredation of insects; when, in consequence of this cruel and impolitic act, the birds were "nearly extirpated, insects increased to such a degree as to cause a total loss of the herbage, and the inhabitants were obliged to obtain hay for their cattle, not only from Pennsylvania, but even from Great Britain."—KIRBY, vol. i. p. 289.—*Linn. Trans.* v. 105, note.

Many birds besides rooks are destroyed, under the mistaken idea that they are injurious to the garden or orchard, at the very time they are most useful to both in feeding themselves and their nestlings on grubs and caterpillars.

"The common sparrow, though proscribed as a most mischievous bird, destroys a vast number of insects. Bradley has calculated that a single pair, having young to maintain, will destroy 3360 caterpillars in a week." "The blue tit-mouse (*Parus caeruleus*, LINN.) often falls a victim to ignorance in this country (Ireland), as it does in England, in consequence of the injury it is supposed to do to fruit-trees. Mr Selby most justly pleads in favour of its being a friend rather than an enemy to the horticulturist."†

Quadrupeds, as well as birds, suffer much under slanderous imputations, as can be attested by the badger and the hedgehog. The former, a harmless inoffensive animal, is baited and worried by dogs, because he destroys lambs and rabbits! This charge, however, has not been substantiated; and it is known that he feeds on roots, fruits, insects, frogs, and such small game. But he is strong and powerful, and can repel his assailants, when fairly matched, with great dexterity. He is therefore capable of affording an "inhuman diversion," as Bewick states, "to the idle and the vicious, who take a cruel pleasure in seeing this harmless animal surrounded by its enemies, and defending itself from their attacks, which it does with astonishing agility and success." The hedgehog also is assailed by dogs, torn in pieces, drowned, or burned, because he sucks cows! whereas he might as well be accused of sucking the great northern bear. He also climbs apple-trees, and carries off the fruit sticking to the spines on his back! Such a dexterous feat would merit the apples; and should he eat the fruits that fall in his way, they would be but a small compensation for his services to the horticulturist in gnawing the roots of the plantain, a troublesome weed, and in destroying worms, beetles, and various species of insects. If taken to the

kitchen, he will soon clear it of cockroaches, and ably discharge the duties of a turnspit dog.

That God has created nothing in vain, should be considered as an axiom both in philosophy and religion; though there may be some things of which we cannot see the immediate use, and others, in certain localities, positively injurious. Animals the most feeble, and apparently insignificant, even those which escape unassisted vision, as the *infusoria* and other animalcules, serve the most beneficial purposes. They supply nutriment to creatures larger and stronger; and these in their turn become the prey of a still stronger race; and these again of birds, fishes, quadrupeds, and man. Buffon says, "Insects do more harm than good;" a strange assertion from so distinguished a naturalist! The entire genus of swallows, the woodpeckers, and the young of almost the whole feathered creation, and the tribes of fishes, would contradict his assertion. The ant-eater, the chameleon, the mole, the bat, the hedgehog, and the badger, will testify against him, as will also the bee-master, the silk-manufacturer, and the physician.

Insects are teasing, sometimes destructive; but they labour industriously to provide us with food and raiment, with dye-stuffs and medicine. Innumerable myriads of gnats (*Culex pipiens*), in the northern regions, supply food for shoals of fishes and millions of game, and may be considered as the proximate cause of the annual migrations of the finny and the feathered tribes, which afford such an abundant supply of nutriment, not only to the Laplander and Esquimaux, but to the inhabitants of every shore which they visit. Were insects annihilated, how many species of other animals would languish and die! and man himself would be among the greatest sufferers. For it is with the animal kingdom, as with the body politic, or the microcosm of the human frame, if "one member suffer, all the members suffer with it," and the loss of one class or order would involve that of another, till all would perish. If some species are injurious to the garden and the orchard, the wardrobe and the museum, they are beneficial in some other department, and the mischief of which we complain is amply compensated by the greater good of which they are the ministers. The *Dermestes*, the *Cerambyx*, and the *Cantharis navalis*, prey upon wood. They injure the water-pipe, reduce the fallen trees of the forest to powder, and bore through the warship's ribs; but while busied in these operations, they are furnishing employment to the pump-borer, the sawyer, and the carpenter. St Pierre has beautifully observed, that "the weevil and the moth oblige the wealthy monopoliser to bring his goods to market, and by destroying the wardrobes of the opulent, they give bread to the industrious. Were grain as incorruptible as gold, it would be soon as scarce; and we ought to bless the hand that created the insect that obliges them to sift, turn, and ultimately to bring the grain to public sale."

ON SEEING A DECEASED INFANT.

[By W. O. B. Peabody, an American author.]

And this is death! how cold and still,
And yet how lovely it appears:
Too cold to let the gazer smile,
But far too beautiful for tears.

The sparkling eye no more is bright,
The cheek hath lost its rose-like red;
And yet it is with strange delight
I stand and gaze upon the dead.

But when I see the fair wide brow,
Half shaded by the silken hair,
That never look'd so fair as now,
When life and health were laughing there,
I wonder not that grief should swell
So wildly upward in the breast,
And that strong passion once rebel
That need not, cannot be suppress'd.

I wonder not that parents' eyes,
In gazing thus grow cold and dim,
That burning tears and aching sighs
Are blended with the funeral hymn;
The spirit hath an earthly part,
That weeps when earthly pleasure flies,
And heaven would scorn the frozen heart,
That melts not when the infant dies.

And yet why mourn? that deep repose
Shall never more be broke by pain;
Those lips no more in sighs unclose,
Those eyes shall never weep again.
For think not that the blushing flower
Shall wither in the church-yard sod,
'Twas made to gild an angel's bow
Within the paradise of God.

Once more I gaze—and swift and far
The clouds of death in sorrow fly,
I see thee like a new-born star
Move up thy pathway in the sky.
The star hath rays serene and bright,
But cold and pale compared with thine;
For thy orb shines with heavenly light,
With beams unfading and divine.

Then let the burthen'd heart be free,
The tears of sorrow all be shed,
And parents calmly bend to see
The mournful beauty of the dead;
Thrice happy—that their infant bears
To heaven no darkening stains of sin;
And only breathed life's morning air,
Before its evening storms begin.

Farewell! I shall not soon forget!
Although thy heart hath ceased to beat,
My memory warmly treasures yet
Thy features calm and mildly sweet;
But no, that look is not the last,
We yet may meet where seraphs dwell,
Where love no more deplores the past,
Nor breathes that withering word—farewell.

PARTY-SPIRIT—ITS EFFECTS.

Our institutions do not cultivate us, as they might and should; and the chief cause of the failure is plain. It is the strength of party-spirit; and so blighting is its influence, so fatal to self-culture, that I feel myself bound to warn every man against it, who has any desire of improvement. I do not tell you it will destroy your country. It wages a worse war against yourselves. Truth, justice, candour, fair dealing, sound judgment, self-control, and kind affections, are its natural and perpetual prey. I do not say that you must take no side in politics. The parties which prevail around you differ in character, principles, and spirit, though far less than the exaggeration of passion affirms; and as far as conscience allows, a man should support that which he thinks best. In one respect, however, all parties agree. They all foster that pestilent spirit, which I now condemn. In all of them, party spirit rages. Associate men together for a common cause, be it good or bad, and array against them a body resolutely pledged to an opposite interest, and a new passion, quite distinct from the original sentiment which brought them together, a fierce, fiery zeal, consisting chiefly of aversion to those who differ from them, is roused within them into fearful activity. Human nature seems incapable of a stronger, more unrelenting passion. It is hard enough for an individual, when contending all alone for an interest or an opinion, to keep down his pride, wilfulness, love of victory, anger, and other personal feelings. But let him join a multitude in the same warfare, and, without singular self-control, he receives into his single breast the vehemence, obstinacy, and vindictiveness of all. The triumph of his party becomes immeasurably dearer to him than the principle, true or false, which was the original ground of division. The conflict becomes a struggle, not for principle, but for power, for victory; and the desperateness, the wickedness of such struggles, is the great burden of history. In truth, it matters little what men divide about, whether it be a foot of land or precedence in a procession. Let them but begin to fight for it, and self-will, ill-will, the rage for victory, the dread of mortification and defeat, makes the trifle as weighty as a matter of life and death. The Greek or Eastern empire was shaken to its foundation by parties, which differed only about the merits of charioteers at the amphitheatre. Party spirit is singularly hostile to moral independence. A man, in proportion as he drinks into it, sees, hears, judges by the senses and understandings of his party. He surrenders the freedom of a man, the right of using and speaking his own mind, and echoes the applauses or maledictions with which the leaders or passionate partisans see fit that the country should ring. On all points, parties are to be distrusted, but on no one so much as on the character of opponents. These, if you may trust what you hear, are always men without principle and truth, devoured by selfishness, and thirsting for their own elevation, though on their country's ruin. When I was young, I was accustomed to hear pronounced with abhorrence, almost with execration, the names of men who are now hailed by their former foes as the champions of grand principles, and as worthy of the highest public trusts. This lesson of early experience, which later years have corroborated, will never be forgotten.

Among the best people, especially among the more religious, there are some who, through disgust with the violence and frauds of parties, withdraw themselves from all political action. Such, I conceive, do wrong. God has placed them in the relations, and imposed on them the duties, of citizens; and they are no more authorised to shrink from these duties than from those of sons, husbands, or fathers. I counsel you to labour for a clear understanding of the subjects which agitate the community, to make them your study, instead of wasting your leisure in vague, passionate talk about them. The time thrown away by the mass of the people on the rumours of the day, might, if better spent, give them a good acquaintance with the constitution, laws, history, and interests of their country, and thus establish them in those great principles by which particular measures are to be determined. In proportion as the people thus improve themselves, they will cease to be the tools of designing politicians. Their intelligence, not their passions and jealousies, will be addressed by those who seek their support. They will exert, not a nominal, but a real influence on the government and the destinies of the country, and at the same time will forward their own growth in truth and virtue.—*Channing's Lecture on Self-Culture*, just published.

We this week commence the publication of a series of Tales by a distinguished Irish writer, the first object of which is, of course, like that of all other articles introduced into the Journal, the entertainment and instruction of the public at large. It becomes our duty to mention that the accomplished writer has a special object of her own, in which we heartily sympathise: she wishes, by such means, to do what she may for the improvement of the morals and economy of her fellow-countrymen. It is very obvious that, while the humbler orders of the Irish people possess as many of the finer elements of human character as most nations, they have, like others, their faults, and that these faults are in perpetual operation to blight the happiness both of individuals and of the community. They are often, to use common language, faults of the head than the heart; but still, whatever be their nature, they prove serious obstructions to that social progress which all neighbouring nations are anxious to see promoted in Ireland. It is Mrs Hall's aim to present pictures of real life, in which these faults shall be, as it were, mirrored—not, we may be sure, in the spirit of censure, but in that of kind remonstrance at the utmost. She also expects to aid, by this means, in creating a more intimate and friendly acquaintance between the people of Ireland and those of England and Scotland.

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all book-sellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any old numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

PRICE THREE HALFPENCE.

LIFE-ASSURANCE.

ALTHOUGH there are about sixty Life-Assurance Companies and Societies in the kingdom, all of which are constantly making strenuous efforts to attract public attention to the peculiar advantages which they have to offer, it is a fact not less true than surprising, that the number of individuals who have availed themselves of life-assurance in the United Kingdom of Great Britain and Ireland is not much above eighty thousand. Allowing twenty-five millions to be the population of the empire, and five persons to be the number of each family, it would thus appear that not more than one head of a family out of sixty-two has adopted this means of providing for the helpless beings whom he may leave behind him. If there were other means in abundance of providing for widows and fatherless children, we might be little surprised at this calculation; but when we consider that the case is quite the reverse—that few fathers have property wherewith to provide for a surviving family, that the number connected with the institutions which allow pensions to widows is necessarily small—when we consider, in short, that the great majority of men who have wives and children have nothing but an income depending on their own life and exertions between their families and want—we cannot but conclude that the expedient of life-assurance is either unknown to a large portion of society, or knowingly neglected by them. In either case, a short paper explaining the subject, and enforcing its claims on the attention of husbands and fathers, may be expected to prove in some degree useful.

Life-assurance was not practised in this country till the reign of Queen Anne, when "the Amicable Society" was established in London. At that period no inquiries had been made to ascertain the probable duration of life after any specified age: there was a general notion that life was uncertain at all ages; and, accordingly, for the first fifty years of life-assurance, the charges for insuring a certain sum were the same for all persons under forty-five! In time, however, it became known that a person at, we shall say, thirty, has a chance of living a longer time than a person at forty, and so on; and the consequence was, that, in 1762, "the Equitable Society" of London was established, on the principle of making charges in proportion to the various ages of the parties. Since then, calculations as to the probable duration of life after any certain age have been made with more nicety, so that life-assurances are now, and have long been, transacted on principles of exact justice to individuals, with respect to their ages.

Down to a comparatively recent period, life-assurance was chiefly conducted on the ordinary principles of a mercantile speculation. A company, possessing a large capital, assured sums payable on the deaths of parties, at certain rates, calculating on a profit from their transactions. The sole advantage of this plan lay in the guarantee afforded by the capital of the company. It has since been found that, by the plan of mutual assurance, all desirable security is afforded, while the profits are divisible among the only parties who have any right to them, the assurers. Mutual-Assurance Societies are therefore rapidly supplanting Assurance Companies, most of which will probably in a few years cease to exist. In the present paper, we propose to confine our attention to the plan of mutual assurance.

Mutual assurance proceeds on the following simple principles. While it is an indubitable fact that nothing is more precarious than the life of an individual, seeing that a thousand dangers constantly beset him, it is an equally certain fact that, if we take so large a number as ten thousand persons, or even a smaller number, it is possible to say with almost unerring certainty how many of these will die during the next ensuing year, how many in the next again, and so on, until, at about the age of 100, not one person remains.

Thus Dr Price of Northampton took 11,650 individuals, whose births and deaths were recorded in the proper books at that town, and found that in the first year 3000 died, in the second 1367, in the third 502, in the fourth 335, in the fifth 197, and so on till the last man died at 96. Dr Price consequently assumed that, of any 11,650 individuals who existed in the like circumstances, 3000 would die in the first year, 1367 in the second, and so on. It will be observed that the whole number who die in the first five years is 5401, leaving 6249 then alive: consequently, any one of the 11,650 children, at the moment of birth, had a chance of living five years equal to the proportion which 6249 bears to 5401, or somewhat more than a half. No man could say, at the moment, that any one of these babies would continue alive for three seconds; but yet it was possible to say with some degree of probability that, in the proper circumstances, 6249 of the whole number would live to the commencement of the sixth year. When we go on to an age at which life-assurance is more likely to be effected—say 52—we find that, of 100,000 persons who complete this portion of existence, 3044 will die before the end of the ensuing twelvemonth, so that each man's chance of dying in that space of time is in the proportion of 3044 to 100,000, or about 3 to 100. Now, supposing that these 100,000 persons were each desirous of insuring the payment of £100 to his heirs in the event of his dying during this year, it is evident that if they deposit a sum equal to 3044 times £100, that is £304,400, or about £3. 0s. 10½d. each, they will form a fund sufficient for this purpose, leaving nothing over. We have only to suppose a set of persons of different ages depositing each the sum appropriate to his age, and continuing to do so as long as he lives, and we then have the idea of a Mutual-Assurance Society in all except this—that, generally, instead of paying an increasing sum each successive year, proportioned to the increased risk, it is common to strike a medium in the probable future payments, and pay that from the beginning. Thus, in point of fact, the sum usually required for the assurance of £100 at death, from individuals aged fifty-two, is nearly five pounds.

While Mutual-Assurance Societies are founded upon this basis, they take, from circumstances, another character in addition to that which they hold out to the public. It may readily be conceived that the calculations of the probable duration of lives are liable to be modified by certain contingencies. From climate, and modes of living, there is more health and better expectation of life in some countries than in others. Even in the same country, from improvements of various kinds, the ratio of deaths to the amount of the living inhabitants may be experiencing diminution, so that a man of thirty has the chance of living several years longer than his grandfather had at the same age. In this country, the annual mortality is considerably less in proportion than it was sixty years ago. Consequently, the calculations of Dr Price, forming what are called the Northampton Tables, and which are above adverted to, although they were formed amongst a comparatively healthy rural population, are no longer strictly true. They calculate the chance of life at each particular age too low, and dictate the taking of a too high premium for assurance: in other words, a man at 52 has not in reality a chance of death in the next year equal to the proportion of 3044 to 100,000, but something less, and he should therefore pay less than £3. 0s. 10½d. to assure £100 for a year. Nevertheless, the most of Mutual-Assurance Societies, such as the Equitable of London, and the Scottish Widows' Fund and Scottish Equitable in Edinburgh, proceed upon the Northampton calculations—but for a reason which must be generally approved of. By this plan a considerable surplus takes place, which, at certain intervals, is reckoned, divided, and added to the standing policies, or sums assured, in their respective proportions. It must be evident that this plan, while it

adds to the security of the society, will be perfectly just to all parties, if the divisions of the surplus do not take place at such wide intervals as to leave many policies of short currency unbenefited. The society last mentioned appears to us to make this justice most certain, as it divides the surplus triennially, being the shortest interval in practice. Now, what is the general result of this adherence to a large calculation of mortality, but that Mutual-Assurance Societies become also, as it were, banks for savings! The money deposited there, is not, strictly speaking, parted with. It is put into a stock, where it is sure of being invested to the best advantage—presuming the managers to be honourable and expert men. If the individual die before his proper time, a much larger sum is drawn out by his representatives. If, on the contrary, he live beyond the average, and make payments beyond the amount of the sum originally assured, still, in the long-run, when he dies, his heirs get not alone that sum, but something more, in proportion to the excess of his payments and the profits made by the investment of the society's funds, lessened only by his contingent for the expenses of the society. In many cases, where a policy was of moderately long standing, it has been found that the sum originally assured has been doubled, or more than doubled, while the premium, or annual sum paid for assurance, had of course sustained no increase.

Such being the equitable and beneficial principles on which Mutual-Assurance Societies are established, it is clear that they present, to men in the enjoyment of income, but possessing little property, a most suitable and favourable means of providing in a greater or less measure for the endeared and helpless relatives who may survive them. That only about 80,000 persons in the United Kingdom should have taken advantage of life-assurance, being but one in sixty-two of the supposed number of heads of families, surely affords a striking view of—shall we call it the improvidence of mankind, or shall we not rather designate it as their culpable selfishness! For what is the predicament of that man who, for the gratification of his affections, surrounds himself with a wife and children, and peaceably lives in the enjoyment of these precious blessings, with the knowledge that, ere three moments at any time shall have passed, the cessation of his existence may throw wife and children together into a state of destitution! When the case is fully reflected upon, it must certainly appear as one of extremely gross selfishness, notwithstanding that the world has not been accustomed to regard it in that light. If, indeed, it were utterly impossible to provide for a widow and orphans, no fault could fairly be found. And, no doubt, the little blame bestowed by the world on this account is owing to the fact, that, till a recent period, no means of providing for these relatives existed. They were in those days invariably left to the mercy of the public. But that this occasioned many evils, we may be abundantly satisfied, from the earnestness with which the founders of Christianity press the duty of succouring the widow and fatherless—one of them representing religion as almost entirely consisting in that benevolent action alone. Assuredly, if there had not been much misery from this cause, there would have been no need for so much urgency on the subject. But if we only consider for a moment how mainly every one is engaged in providing for himself, we must be satisfied of the extreme precariousness of any provision which is expected to come from parties not responsible. It is therefore the duty of every man to provide, while he yet lives, for his own: we would say that it is not more his duty to provide for their daily bread during his life, than it is to provide, as far as he can, against their being left penniless in the event of his death. Indeed, between these two duties there is no essential distinction, for life-assurance makes the one as much a matter of current expenditure as the other. One part of his income can now be de-ot i

by a head of a family to the necessities of the present; another may be stored up, by means of life-assurance, to provide against the future. And thus he may be said to do the whole of his duty towards his family, instead of, as is generally the case, only doing the half of it.

It may be felt by many, that, admitting this duty in full, income is nevertheless insufficient to enable them to spare even the small sum necessary as an annual premium for life-assurance. The necessities of the present are in their case so great, that they do not see how they can afford it. We believe there can be no obstacle which is apt to appear more real than this, where an income is at all limited; and yet it is easy to show that no obstacle could be more ideal. It will readily be acknowledged by every body who has an income at all, that there must be some who have smaller incomes. Say, for instance, that any man has £400 per annum: he cannot doubt that there are some who have only £350. Now, if these persons live on £350, why may not he do so too, sparing the odd £50 as a deposit for life-assurance? In like manner, he who has £200 may live as men do who have only £175, and devote the remaining £25 to have a sum assured upon his life. And so on. It may require an effort to accomplish this; but is not the object worthy of an effort? And can any man be held as honest, or any way good, who will not make such an effort, rather than be always liable to the risk of leaving in beggary the beings whom he most cherishes on earth, and for whose support he alone is responsible? It may perhaps be thought that we feel strongly on this subject: we own that we do; but if the generality of men saw the case in its true light, they would feel as strongly as we do. They are only comparatively indifferent, because there has as yet been but a brief experience of a system for redeeming widows and orphans from poverty. When life-assurance is as universally understood and practised as it ought to be, he who has not made such a provision, or something equivalent, for the possibility of his death, will, we verily trust, be looked on as a not less detestable monster than he who will not work for his children's bread; and his memory after death will be held in not less contempt.

SCENE WITH A PIRATE.

In the month of July 1813, I was on my way from New York to the island of Curaçoa, on board the American ship Patrick Henry, commanded by Captain Tuttle. We had had a fine passage, and were looking forward to the end of our voyage in about a week. I was the only passenger, and of course was thrown in a great measure on my own resources for amusement, the chief of which was testing the powers of an admirable glass of London manufacture upon every vessel that showed itself above the horizon. Our captain was kind and civil, but there appeared a mystery about him that he did not like to be pried into, and our communication had in consequence been reserved.

In about latitude 20 degrees, and longitude 60 degrees 15 minutes, we were running along with a fine fresh breeze abeam, and all our weather studding-sails set. I was sitting alone in the cabin, ruminating upon the changes of scene and society into which I had been forced so contrary to my inclinations, and wondering whether the happiness of a quiet and domestic life was ever to fall to my lot, when the captain came down and told me that, as I was so fond of using my glass, there was a vessel just appearing on the horizon to windward, and that I might go and see what she was, for he could not make her out at all. I went on deck, and mounted into the main-top, and began my scrutiny. "Well, what is she?" asked the captain from the deck. "I can hardly make her out, but I think she is a schooner." "Ay—what's her course?" "South-west by south, I think; about the same as ourselves." I remained in the top for a few minutes, and continued looking at the stranger. "She seems fonder of the sea than I am," I continued, "for she might have her topsails and top-gallants, and studding-sails to boot, all set, instead of slipping along under her lower sails." The captain made no answer, but was looking hard at her with his eye. I now perceived through my glass a white speck above her foresail, flap, flapping against the mast. "Well, she must have heard me, for there goes her fore-top-sail." The captain now went to the companion for his glass, and after looking attentively at her for a short time, "What's that?" he asked; "is that her square-sail she's setting? I can't very well see from the deck." I looked again: "Yes, 'tis her square-sail; as I'm alive, she's changed her course, and is bearing down upon us." But by this time the captain had mounted the rigging, and was standing beside me; he was eyeing the distant vessel keenly. After having apparently satisfied himself, he asked me to go with him to the cabin, as he wished to talk

with me alone. We descended to the deck, and I followed him to the cabin. He motioned me to take a seat, and after carefully shutting the door, "I rather expect," said he, "that fellow's a pirate." "Pirate!" I asked in alarm. "Yes, I say pirate, and I'll tell you why. In the first place, you see, he'd no business to be sneaking along in that do-little sort of a way, as when we first saw him; who ever, that had any honest business to do, would allow such a fine breeze to go by without showing more canvass than a powder monkey's old breeches to catch it? Next, you see, what the mischief has he to do with us, that, as soon as he clapped eyes on us, he must alter his course, and be so anxious to get out his square-sail? Again, he looks just like one of those imps of mischief, with his low black hull and tall raking masts. But it's no use talking; I tell you he's a pirate, and that's as true as my name's Isaac Tuttle. And now the only thing is, what shall we do? The Patrick Henry ain't a Baltimore clipper, and that 'ere devil will walk up to us like nothing. But I'll tell you what strikes me.—If we let them devils aboard, it's most likely we'll all walk the plank; so we'd better try to keep 'em out. We haint got but an old rusty carronade and two six-pounders, and I don't believe there's a ball on board, we came off in such a hurry. Then, there's two muskets and an old regulation rifle down in my state-room; but they haint been fired I don't know when, and I'd as lief stand afore 'em as behind 'em. But our ship's as handsome a looking craft as you'll see; and couldn't we look wicked-like now, and try to frighten that cutthroat-looking rascal?"

I confess I was at first startled at the captain's opinion of the strange sail, and his reasoning left me hardly a hope that his judgment was not correct; but his cool and collected manner impressed me with confidence in his management, and I told him he knew best what we should do, and I would second him as I best could. He walked up and down the cabin twice; then rubbing his hands together as if pleased with his own idea, "I have it," he cried; "I'll just go on deck to put things in order, and in the meantime you'd better amuse yourself looking out your pistols, if you have any; for if he won't be content with a look at us, we'll have to fight."

I hurriedly took my fowling-piece and pistols from their cases, for I fortunately had both; and though I somehow refused to allow myself to believe there would be any occasion for their use, yet I loaded them all with ball, and in each of the pistols put a brace; this done, I went on deck, where I found the captain surrounded by his crew, telling them his suspicions, and his plan of action. "But," said he, "maybe we'll have to fight; if them devils have a mind to try us, they'll send a boat on board, and I want to know if you'll help me to keep 'em off. You see it's most likely they'll make you walk the plank, whether you fight or not, if they get on board; and I calculate, if you do just as I tell you, we'll frighten 'em." There was a hearty "Ay, ay, sir," to this short and pithy harangue. "Thankee, thankee, boys," said the captain; "now we'll not show another stitch of canvass, but seem to take no more notice of that fellow than if we didn't see him; and if he does try to come aboard, then we'll show 'em what we can do."

Our captain was about fifty years old, rather short and stout, but muscular; his face was bronzed with time and tempest, and his locks, which had once been black, were grizzled by the same causes. He was an old sailor and a staunch republican; and as some of his men told tales of fight in which their captain had borne a part, I presumed he had served when a young man in the navies of the states.

The crew were busy, in obedience to his orders, cutting up a spare fore-top-gallant-mast into logs of about four feet long; these were immediately painted black, with a round spot in the centre of one end, so as to bear a tolerable resemblance to pieces of cannon, and, with two old six-pounders, were placed, one at each port, on our deck, five on a side; but the ports were to be kept closed until the captain gave the order to open them, when they were to be raised as quickly as possible, and the logs thrust out about a foot. A platform was then made on the top of the long-boat, which was fixed between the fore and main masts, and the carronade, or fourteen-pounder, was hoisted up. These things being arranged, the captain went below, and the crew mustered in knots, to wonder and talk of what was to be done.

In the mean time, we had been standing on our course, and had not shifted or hoisted a single sail, but were as if perfectly regardless of the schooner. Not so with her, however; for besides a large square-sail and square-topsail on the foremast, she had run out small fore-topmast studding-sails, and onward she came, right before a pretty smart breeze, yawing from side to side, at one moment sinking stern foremost into the trough of the sea, as an enormous wave rolled out from under her, and at the next forced headlong onwards by its successor, while a broad white sheet of foam spread out around her, giving beautiful relief to the jet-black colour of her hull, testifying how rapidly she was going through the water. I could not help thinking of the captain's expression, for she certainly did "walk up to us like nothin'," and as there appeared to be not much time to lose, I went down to the cabin to assume my weapons. The captain was there arranging some papers, and a bottle was before him, into which he had put a letter. "May be," said

he, "something'll happen to me; for if them 'ere bloody devils won't be cheated, I will be the first to suffer; and natural enough too, for all the mischief they'll suffer will be by my orders, just because I didn't like to be overhauled like an old tarpanlin by every rascal that chooses to say leave to, in the high seas. But never mind; only, should you escape, just drop the bottle and letter overboard, if you think you can't deliver it yourself."

Now, I had never seriously considered the probability that I might also be killed in an approaching mêlée, for I thought that the captain intended to throw open his ports and show his sham guns, and that, of course, the schooner would take fright. But when he began to talk about death in such a serious strain, I began to feel very uncomfortable; and not being naturally a warrior, I wished myself any where else than on board the Patrick Henry. There I was, however, without a chance of escape; and I suggested to the captain that it would be as well for me to put a letter into the bottle also, in case of any accident to both of us, which was agreed to; and we arranged that if either survived and had the opportunity, the letter of the unfortunate should be safely forwarded to its destination. After this little piece of preparation, the captain took me by the hand. "'Tis well," said he; "are you willing to share with me the post of danger? Do not suppose I am unaccustomed to the perils of a sea-fight; no, young man; I've supported the glory of the thirteen stripes in many a gallant action, and have witnessed the death of those honoured and esteemed as the sons of liberty. Yet they were fighting for their country, and it was their duty to hold their lives cheap; but you are a passenger, and should be under my protection—yet I ask you to share my danger. I wish some one to stand by me on the platform, and help me to manage the swivel. Hands are scarce, and I don't know where else to place you." The hardy fellow's eyes glistened as he made the proposal, to which I of course instantly agreed. "Thankee, thankee," he replied, and relapsed into his former character. 'Twas strange; he had always appeared on board his vessel as a common Yankee captain, with little to say, and with a rough uncouth manner but little removed from his men. Yet he at once, though evidently inadvertently, assumed the air and manner of a polished gentleman; and it certainly struck me that the latter character appeared more natural to him than the former. There was evidently a mystery about him, and I determined to find it out when more opportune circumstances should occur.

We went on deck, and the men were still hanging about waiting for the orders of their captain to make them start. These were soon given. The cooper and the carpenter were ordered to bring up all hatchets and other offensive and defensive weapons, and with the muskets and rifle they were distributed among the crew, who received their orders to use them in repelling any attempt to board.

The schooner had now come down within half a mile of us, when she suddenly took down her square-sail, and hauled her wind, to have a look at us. I daresay she did not know what to make of our seeming indifference. Presently a cloud of smoke burst from her side, and a ball came skipping over the water, and passed astern of us. "I thought so," said the captain; "now, lads, show her our stripes." A ball of bunting flew up to the end of our mizen peak, rested an instant, and fluttered out into the American ensign. The smoke drifted away from the schooner, and she ran up at her gaff the ensign of the Colombian republic. "That's 'ternally the way with them blackguards; they're always making a fool of some republic." Scarcely were the words out of his mouth, when another column of smoke burst from the schooner, and another ball came skip—skipping along towards us, but, catching a swell, it plunged in, and we saw no more of it. "That fellow now, I take it, is a good shot, so we'll not wait for another. Clue up the main-sail, boys; haul aft the weather main-braces; clue up the foresail; luff her, man, luff her a little more—steady," burst from our captain's mouth: the orders were obeyed with the quickness of a well-disciplined crew, and our ship was hove to. "Now, my lads, take your stations, four to each port on the weather side, but do nothin' till I tell ye." The men took their stations, as directed, round each log on the weather side, and I followed the captain to the platform where our carronade was mounted. It was loaded to the muzzle with bits of iron, musket-balls, lumps of lead, and various other missiles, for the captain had conjectured truly—there were no balls on board. The schooner hove to, and a boat was lowered, and crowded with men. It approached rapidly, pulled by eight rowers. The muzzle of our carronade was depressed as much as possible, and made to bear on the water about fifty yards from the ship. The captain stood with his speaking-trumpet in one hand, and a handspike, with which he shifted the position of the gun as required, in the other. The schooner's boat approached, and was pulling rapidly to get alongside. "Now, sir, keep steady, and obey my orders coolly," said the captain in an under tone. "Boy, fetch the iron that's heating in the galley—run." The boy ran, and returned with the iron rod heated at one end, which was handed to me. "When I tell you to fire, fire, as you value your life and those on board." The captain now put his speaking-trumpet to his mouth, and hailed the boat, which was within a hundred yards of us. "Stop—no nearer, or I'll blow you all out of the water—keep off,

keep off, or, I say, I'll—” At that instant the man at the bows of the boat, who appeared to take the command, gave an order, and a volley from several muskets was fired at us. I heard the balls hit about me, and turned to look for the captain to receive my order to fire. He was on one knee behind the cannon, and holding it by the breech. “Why, captain! what's the matter! are you hit?” He rallied. “Nothing—they're coming.” He gave another hoist to the gun, cast his eye hurriedly along its barrel—“Fire, and be quick!” I needed not a second bidding, for the boat was close alongside. The smoke burst from the touch-hole with a hiss, and for an instant I thought the gun had missed fire, but in the next it exploded with a tremendous report, that deafened me. “Throw open your ports, boys, and show them your teeth,” roared the captain through his trumpet, and his voice sounded hideously unnatural. In an instant every port was up, and our guns protruded their muzzles. I had fancied that I heard a crash, followed by wild screams, immediately upon the discharge of the cannon; but the report had deafened me; and the smoke, which was driven back in my face, had so shrouded me, that I could not see; and the unearthly shout of the captain had also for the moment driven the idea from my mind, and I now grasped my gun to repel boarders. But my hearing had not deceived me; for, as the smoke was borne away to leeward, the whole scene of destruction burst upon my sight. The cannon had been most truly pointed, and its contents had shivered the hapless boat, killing or wounding almost every person in her. The longest lifetime will hardly efface that scene from my mind. The stern of the boat had been carried completely away, and it was sinking by the weight of the human beings that clung to it. As it gradually disappeared, the miserable wretches straggled forward to the bows, and with horrid screams and imprecations battled for a moment for what little support it might yield. The dead and the dying were floating and splashing around them, while a deep crimson tinge marked how fatal had been that discharge. Ropes were thrown over, and every thing done to save those that were not destroyed by the cannon-shot, but only three out of the boat's crew of twenty-four were saved; the greater part went down with the boat to which they clung.

The whole scene of destruction did not last ten minutes, and all was again quiet. The bodies of those who had been shot did not sink, but were driven by the wind and sea against the side of the ship. From some the blood was gently oozing, and floating around them; others, stiff in the convulsion in which they had died, were grinning or frowning with horrible expression. One body, strong and muscular, with neat white trousers, and a leathern girdle in which were stuck two pistols, floated by, but the face was gone; some merciless ball had so disfigured him, that all trace of human expression was destroyed. He was the pirate captain.

But where was the schooner? She lay for a few minutes after the destruction of her boat; and whether alarmed at our appearance, or horrified at the loss of so many of her men, I know not, but she slipped her foressail, and stood away as close to the wind as possible. We saw no more of her.

The excitement of the scenes we had just passed through, prevented our missing the captain; but so soon as the schooner bore away, all naturally expected his voice to give some order for getting again under weigh. But no order came. Where was he? The musket discharge from the boat, with the unearthly voice that conveyed the orders for the ports to be thrown open, flashed across my mind. I ran to the platform. The captain was there lying on his face beside the gun that he had pointed with such deadly effect. He still grasped the speaking-trumpet in his hand, and I shuddered as I beheld its mouth-piece covered with blood. “The captain's killed!” I cried, and stooped to raise him. “I believe I am,” said he; “take me to the cabin.” A dozen ready hands were stretched to receive him, and he was taken below, and carefully laid on a sofa. “Ay,” he said, “I heard the crash; my ear knows too well the crash of shot against a plank to be mistaken, and my eye has pointed too many guns to miss its mark easily now. But, tell me, is any one else hurt?” “No, thank God,” I said; “and I hope you are not so badly hit.” “Bad enough. But cut open my waistcoat—'tis here.” A mouthful of blood stopped his utterance, but he pointed to his right side. I wiped his mouth, and we cut off his waistcoat as gently as possible. There was no blood; but on removing his shirt, we discovered, about three inches on the right of the pit of the stomach, a discoloured spot, about the size of half-a-crown, darkening towards its centre, where there was a small wound. A musket ball had struck him, and from there being no outward bleeding, I feared the worst. We dressed the wound as well as circumstances would permit; but externally it was trifling—the fatal wound was within. The unfortunate sufferer motioned for all to leave him but me; and calling me to his side, “I feel,” said he, “that I am dying; the letter—promise me that you will get it forwarded—'tis to my poor widow. Well, I've tempted this death often and escaped, and 'tis hard to be struck by a villain's hand. But God's will be done.” I promised that I would personally deliver the letter, for that I intended returning to New York from Curaçoa. “Thank you truly,” said the dying man; “you will then see my Helen and my child, and can tell them that their unfortunate husband and fa-

ther died thinking of them. This ship and cargo are mine, and will belong to my family. Stranger, I was not always what I now seem. But I could not bear that the Yankee skipper should be known as he who once—” A sudden flow of blood prevented his finishing the sentence. I tried to relieve him by change of posture, but in vain; he muttered some incoherent sentences, by which his mind seemed to dwell upon former scenes of battle for the republic, and of undeserved treatment. He rallied for one instant, and, with a blessing for his family, and the name of Helen on his lips, he ceased to breathe.

The body of our unfortunate captain was next day committed to the waves, amidst the tears of us all. Our voyage was prosecuted to an end without further interruption. I did not forget the wishes of the dying man; how faithfully I fulfilled them, and how I have been rewarded, or how satisfactory to me was the previous history of the poor captain, need not be told. Suffice it to say, that I am settled in Elm Cottage, Bloemendaal, and am the happiest son-in-law, husband, and father, in the United States.

BIOGRAPHIC SKETCHES.

MRS BRUNTON.

MARY BALFOUR was born in the island of Barra, in Orkney, on the 1st of November 1778. She was descended from a respectable and ancient family, being the only daughter of Colonel Balfour of Elwick, by his wife Frances Ligonier, niece of Field-Marshal Lord Ligonier. Having been brought up in the house of this distinguished nobleman and soldier, the lady of Colonel Balfour had received accomplishments suited to a much higher sphere than that in which her lot was ultimately and permanently cast. These acquirements, however, did not prove useless, for Mrs Balfour was assiduous in conveying as much of them as she retained to her daughter, and thus, undoubtedly, laid the foundation of that elegant and refined taste which the subject of our memoir afterwards evinced. Under her parent's care, Mary became no mean proficient in music, and a good French and Italian scholar; while, in other respects, the excellent natural parts which she appears to have inherited from her mother, were cultivated with equal care and success. Any defects which might have arisen from the indulgent licence, almost inseparable from merely parental instruction, were in a measure remedied by a short residence at school in Edinburgh. Yet much of Miss Balfour's reading, as she emerged from childhood, was dictated by her own choice, and lay in the walks of poetry and fiction. This course of training, while favourable certainly to the growth of original powers, was prevented from being injurious by her native strength of mind and sound sense.

At the age of sixteen, Mary's attention was almost entirely diverted from her studies to matters of a different character. By her mother's death, the charge of her father's household devolved upon her, and for a period of four years the fatiguing details of Orkney housekeeping left little leisure for any other employments. Towards the close of this period, an opportunity was held out to her of changing the sphere in which she had hitherto moved, for a much more brilliant one. The Viscountess Wentworth (who had formerly been the wife of Mrs Balfour's deceased brother, the second Earl Ligonier) invited her god-daughter, Mary, to come to London and reside with her. But Miss Balfour preferred a less dazzling destiny. She had formed an acquaintance with Mr Brunton, a young and talented clergyman of the Scottish established church, and a mutual attachment was ere long the result. In her twentieth year, Mary became the wife of Mr Brunton, and retired with him to the manse of Bolton, a small parish in the county of Haddington, of which he had been recently appointed incumbent.

This important change brought with it a great accession of leisure, and, as a natural consequence, Mrs Brunton's taste for reading returned in all its original strength. The range of her studies widened, and, though she never lost her liking for literature of a lighter kind, the philosophy of mind, history, and other of the graver branches of knowledge, became favourite objects of her pursuit. Altogether, under the kind and able guidance of her new companion, her course of mental improvement was rendered much more comprehensive and methodical. To her acquirements as a linguist, she, at this time, added a little acquaintance with German; and she even made several earnest, though not very successful, attempts to master the science of mathematics. It was natural, also, that the increased incentives and facilities which her present situation afforded, should turn her thoughts more seriously than ever to religion. The issue of the re-examination of the principles of her belief which she entered into, is beautifully expressed by her husband in the memoir prefixed to her posthumous work. “Both in her own mind, and in the minds of her pupils (two East Indian wards whose education she superintended), she was anxious to make religion an *active* principle, to carry its influence habitually into life. It mingled now with all her own pursuits. She sought knowledge, not merely for the sake of the pleasure which it bestowed, but from a strong sense of duty. She loved nature, not for its own beauty alone, but for the traces with which it abounds of the wisdom and the love of the Creator. Her religion was not a religion of gloom. It shed brightness and peace around her. It gladdened the heart which it purified and exalted.”

After a happy residence of six years at the small

but prettily situated manse of Bolton, Mr Brunton's abilities became so widely known, as to procure for him a call to one of the churches of the Scottish capital, and he accordingly removed thither with his lady in the autumn of 1803. Hitherto Mrs Brunton does not seem to have been aware of the powers of her own mind. Her circle of friends had been too circumscribed to furnish her with any striking examples of talent whereby she might measure and estimate her own abilities. To letter-writing, which often gives the first consciousness of a literary turn to its possessor, Mrs Brunton had ever evinced a peculiar aversion, and was thus precluded from another chance of acquiring this species of self-knowledge. In Edinburgh, however, the new and extended circle in which her station called upon her to move, speedily supplied the opportunities which had heretofore been wanting. Mrs Brunton now mingled in the society of persons of known and proved ability, joined with them in conversation and discussion, and, from the part which she found herself enabled to play, acquired by degrees that intellectual confidence necessary to bring her literary powers into light. Still, a considerable period elapsed, after she had left the country, ere she began the composition of her first work, *SELF-CONTROL*; and when she did take up the pen, she appears to have had no definite intention of ever laying her labours before the public eye. But, as the manuscript swelled on her hands, this design began to be entertained, and the more so, it would seem, from a circumstance, which her husband thus relates. “She had often urged me to undertake some literary work; and once she appealed to an intimate friend, who was present, whether he would not be the publisher. He consented readily; but added, that he would, at least as willingly, publish a book of her own writing. This seemed, at the time, to strike her as something, the possibility of which had never occurred to her before; and she asked, more than once, whether he was in earnest.” This suggestion was not without its influence, and after a portion of the novel was written, the warm approbation of her husband, when it was for the first time shown to him, confirmed Mrs Brunton in the intention both to proceed and to publish. From that time forward, she adhered pretty closely to the rule of writing a certain portion daily; but a visit to Harrowgate, which the state of her health rendered necessary, deferred considerably the completion of the work. It went to press, finally, in September 1810, and appeared before the public, anonymously, in the commencement of the following year. It was dedicated to the most illustrious sister-writer of the age, Joanna Baillie.

Good novels were of comparatively rare issue in Britain, and particularly in the Scottish metropolis, when *Self-Control* was published. With the high merits which it undoubtedly possesses, therefore, it is less wonderful that so great a sensation should have been produced by the work, as actually took place. The first edition went off in one month, and a second and third were called for with almost unexampled rapidity. The *sanctum* of Mr Miller, the Edinburgh publisher, then the rendezvous of all the blues and critics, great and small, male and female, of the city, was kept for months in a continual buzz of conjecture, curiosity, and interest, respecting the nameless and unknown writer. Meanwhile, the authoress remained behind her veil, justly proud of her success, and not unamused by all the criticisms, favourable and unfavourable, which her position enabled her to draw with sincerity from those around her who were not in her secret. Joanna Baillie acknowledged the compliment of the dedication by a letter to the publisher, and to this Mrs Brunton replied in her own name, in a letter which commences as follows:—“No circumstance, connected with the publication of *Self-Control*, has given me half so much pleasure as your very obliging letter—so kind, so natural, so different from the pompous strictures and bombastical praises which have been volunteered on the same occasion. I thank you most heartily and sincerely.” A succeeding portion of this epistle may also be quoted, because in it the authoress gives a fair account of the plan of the work, and apologises in the best way possible for its defects:—“Till I began *Self-Control*, I had never in my life written any thing but a letter or a recipe, excepting a few hundreds of vile rhymes, from which I desisted by the time I had gained the wisdom of fifteen years; therefore I was so ignorant of the art on which I was entering, that I formed scarcely any plan for my tale. I merely intended to show the power of the religious principle in bestowing self-command; and to bear testimony against a maxim as immoral as indelicate, that a reformed rake makes the best husband.” The plot, as here and elsewhere admitted by the authoress, is indeed defective in parts; but the lofty tone of sentiment, the pure morality of purpose, the acuteness of observation, and the prevailing eloquence of diction, which characterise it, might well cover greater blemishes, and render *Self-Control* worthy, upon the whole, of the repute which it gained.

In 1812, Mrs Brunton, who had at all times much pleasure in travelling, accompanied her husband on a visit to London. The travellers went by land, and in a short journal appended to the fragment called *EMERGING*, we find some of the observations made by Mr Brunton on the journey. These jottings, and others written on a second tour in 1815, prove that she was capable of writing in a style much more lively than that which characterises her larger productions. It was on her return from her first London journey

that the novel of *DISCIPLINE* was thought of, its subject having been suggested by Dr Brunton, who imagined it might be beneficial "to show the means through which, when self-control has been neglected, the mind must be trained by suffering ere it can hope for usefulness or for true enjoyment." Upon a regular plan, formed in consonance with this suggestion, Mrs Brunton's second novel was begun, in the end of 1812. Having projected the introduction into it of a sketch of the manners of the Scottish highlanders, she spent a considerable portion of the following year among that people, adding to the previous knowledge which she had of their various peculiarities. At this very period *Waverley* was published, and our authoress saw the field, which she was preparing to enter, preoccupied by one whom she at once recognised and acknowledged as a master. From pure and unaffected humility, she would now have cancelled the highland part of her own story altogether; but her husband prevailed on her, with much difficulty, to retain it, in the hope that the same objects, sketched by a different hand, would still be found to possess novelty. *Discipline* was published in December 1814, and met with very decided approbation from the reading world. But the applause which it received brought the writer much less gratification, than in the case of *Self-Control*; for the authorship was now no secret, and the sincerity of the praise bestowed was open to doubt.

Discipline, with less energy and beauty in individual parts, is more pleasing as a whole than its predecessor, while it has the same excellence of purpose, and general felicity of style. After its publication, Dr Brunton and his lady made their second tour to England, already adverted to. On their return, Mrs Brunton projected the composition of short tales, having "grown distrustful of her power to combine the incidents of a long-continued narrative," to use Dr Brunton's words. Departing a little, however, from the original plan, she began the story of *Emmeline*. Though this occurred in 1816, and her life was prolonged for a considerable period afterwards, *Emmeline* was never finished. A low fever had attacked her when last in London, and it recurred at home with increased violence. When intervals of tolerable health occurred, many avocations interfered to impede her literary labours. Numerous friends courted her society; the share she took in the management of public charities was laborious; and, above all, a noble resolution, which she had long adhered to, of investigating personally every case of distress which claimed relief from her, led to extensive and increasing occupation. What with delicate health, and various calls upon her attention, composition was looked upon as a task, and "she rather (says her memorialist) sought reasons to justify to her own mind the desertion of her former habits, than opportunities of renewing them in their strength." In the summer of 1818, however, she appeared to feel a revival of her literary enthusiasm, and, had health and life been spared to her, would most probably have produced something superior to all her former efforts. The power exhibited in the opening of *Emmeline*, the fragmentary tale published by her husband, justifies such an anticipation. But matters were otherwise ordered. No children had as yet blessed the fireside of Dr Brunton and his lady; but, in the course of the year mentioned, Mrs Brunton was evidently about to become a mother. "She was strongly impressed (says Dr Brunton) that her confinement was to prove fatal; not on vague presentiment, but on grounds of which I could not entirely remove the force, though I obstinately refused to join in the inference which she drew from them." Under this impression, she set her house in order, yet with undiminished fortitude and unshaken cheerfulness. When the hour of trial came, her foresight proved but too clear and acute. She gave birth to a still-born son on the 7th of December 1818, and, after seeming to recover partially, was attacked by fever, and died on the 19th of the month.

In private life, the character of this excellent lady presented an exemplar and model to her sex. Her "mind and heart were open as the day." Of her literary powers something has already been said, but her husband's remark seems to us too just not to call for repetition, that "in all she had done, she was only trying her strength," and might have yet more "heightened the standard of female intellect by her labours." Mrs Brunton's novels have now been in a measure cast aside by the passing legionary novelties of the day, but the sifting hand of time will yet separate them from the ephemeral chaff which has followed them, and give *Self-Control* and *Discipline* a place among the sterling fictions which the incipient years of our century have added to British literature. With the Hamiltons and Ferriers of her country will the name of Mrs Brunton be remembered.

We cannot conclude better than by giving an extract from Joanna Baillie's testimony to the virtues of this amiable lady.

No more shall bed-ridden pauper watch
The gentle rising of the latch,
And as she enters, shift his place
To hear her voice, and see her face.
The helpless vagrant, oft reliev'd,
From her hath his last dole received.
The circle, social and enlighten'd,
Whose evening hour her converse brighten'd,
Have seen her quit the friendly door,
Whose threshold she shall cross no more.
And he, by holy ties endear'd,
Whose life her love so sweetly cheer'd,

Of her cold clay, the mind's void cell,
Hath ta'en a speechless last farewell.
Yea, those who never saw her face,
Nor did on blue horizon trace
One mountain of her native land,
Now turn that leaf with eager hand
On which appears th' unfinished page
Of her, whose works did oft engage
Untir'd attention, interest deep,
While searching, healthful thoughts would creep
To the heart's core like balmy air,
To leave a kindly lesson there—
And gaze, till stain of fallen tears
Upon the snowy blank appears.
Now all, who did her friendship claim,
With alter'd voice pronounce her name,
And quickly turn with wistful ear
Her praise from stranger's lips to hear,
And hoard as saintly relics gain'd
Aught that to her hath e'er pertain'd.
Thus wert thou lov'd and priz'd on earth, and now
Fair, disembodied Spirit! where art thou?
The task of love thou had'st to do is done,
And thou art to thy Father's mansion gone.

THE BOY'S COUNTRY-BOOK.

A NEAT and delightfully embellished little volume, thus denominated, has been published by Mr W. Howitt, author of "The Book of the Seasons" and "Rural Life in England." It bears the alternative title of "The Real Life of a Country Boy," and we have no doubt that this country boy is the worthy author himself. The book may be described as the juvenile Bracebridge Hall of the English rural middle classes. It professes to "exhibit all the amusements, pleasures, and pursuits of children in the country"—a delightful idea of a book, and one which, in such hands, could not fail to be well wrought out. Our readers are already aware of our opinion as to boy life in the country, as compared with boy life in town. In a word, we think that it is only in the country that a boy lives—in a large town he merely grows. Towns are the places for men to moil and live in: they are no field for children at all. The present book, reminding us of our own early days in the country, deepens all our previous convictions to this effect. The things of which it treats—sports by flood and field, gossipry by old-fashioned firesides, simple-hearted men and women, the actual objects of nature living and dead, all that immense variety of healthful and amusing occupation and knowledge which falls to the lot of the country boy—are nearly unknown to the city boy, or can only be revealed to him by means of such a book as the present, while all that the city boy learns on the other hand, from his own peculiar opportunities, is not worthy of being spoken of in comparison, and can be acquired afterwards by the country boy in a very short time.

As a means of in some measure enlightening the juveniles of the town as to what is to be enjoyed and learned in the country, this volume is a welcome gift. We know of no book which we should be more apt to select as a present for a young person in whom we might feel interested—for there is a fine moral feeling from simple natural things. A few extracts would probably justify our opinion in the view of most readers, but we have only room for one, on the subject of Horsemanship:—

"I promised to tell my readers how I learned to ride; and I can assure them that the riding-school of a country lad is often a very funny one. The regular riding-master may teach you to ride gracefully, but as to sticking on a horse, commend me to the country lad's riding-school; which is now a common, now a lane, now on ass-back, now on horse-back, now on hog-back, now on cow-back, and not very seldom on the shaggy back of a good thumping mastiff, or the odiferous chine of a sturdy goat. Any thing that has a back, and can move, is a nag for a country lad; and good swinging gates and spinning turnstiles afford him no inconsiderable exercise and instruction in the necessary art of sitting at ease on the ridge of a moving thing, whether with legs or without them. It is a well-known fact, attested by Sir Walter Scott, and other equally great and learned men, that very few people get properly educated that are not more or less self-educated. And the country lad's equestrian education is to a certainty generally well seasoned with this essential quality of self-instruction. From the moment that a boy mounts his father's walking-stick, he is perpetually mounting upon something, from the wooden horse bought at the fair or the toy-shop—a creature very spotted, and very straight-legged—ascending most industriously and adventurously through that interesting scale just alluded to, up to the stout hunter, scouring away in the break-neck steeple-chase. The professional riding-master may tell you that the boy will still need some scientific instructions, such as to mount with ease and grace, to hold your reins properly in the left hand, your whip in the right, to sit with an air, and to put your horse at will into his different paces, or to show off his action; but I tell you that a sharp lad will never be without such instructions where there is one good rider to be seen, and where he has eyes in his head. He will soon be told by the groom as he mounts his pony, or by his father even as he mounts his rocking-horse, how to conduct himself; and as he naturally contracts a pride and a pleasure in riding, he will mark every thing that he sees in a good and graceful rider, and adopt it; and as for sticking fast in his seat, there never were riders

turned out of any school fit to be compared for a moment with those taught in the country lad's school. I can tell you how I learned to ride, and I can tell you too that I have ridden all sorts of horses; and that in all my life, though sometimes riding every day, and then again for some years not mounting a horse more than half-a-dozen times, I never was thrown more than three times in my life, and that was when I was upon hired horses, which, in jockey phrase, had scarcely a leg left to stand upon, and which tumbled with me so unexpectedly and completely as to send me over their heads. In no single instance have I received the slightest hurt, beyond a sprained thumb.

My first horse was, of course, a stick; my second, one of those spotted straight-legged steeds already mentioned; my third, a rocking-horse, and of this particular horse it is difficult to say too much in praise. It is wonderful what horsemanship may be acquired on the rocking-horse. It does that for a lad which is the main thing of all: it gives him confidence. He learns to balance himself, to feel at ease, to hold his whip and bridle, and, in fact, he acquires all the chief principles of this popular science. I have seen children of not more than six and seven years old, on first quitting their wooden horses for their real ponies, mount them with the confidence, and gallop them and leap them across ditches with all the mastership, of grown men.

My next horses were of that miscellaneous class just adverted to. There was a row of turnstiles between our village and the next, which afforded us many an hour's merry practice; three or four lads sitting on one at once, and one or two others twirling them round. Then there was scarcely a gate that we could get open, but it was swinging to and fro with all its, or rather our, might for hours together; then there were see-saws, or queveels, as we termed them, made of a long plank laid across a log, where we experienced many ups and downs in the world in a very little time. And, let it be noted that all this was no despicable practice; the twirling round is a good preparation for a similar rotatory motion in a quadruped steed, which it sometimes takes into its head to treat you to; and the swinging and banging of a good active gate is no bad introduction to those sideward motions of a horse, called shying, or starting away from under you, if you are not a pretty good horseman, at the sight or supposition of something supernatural—such as the flutter of a bird out of a hedge, or the rustle of a leaf, or the taking off of a beggar's hat just in the face of you. We rode very actively, too, on any long strong bough that we could pull down in a tree low enough for us to mount upon—not unfrequently even mounted grave-stones, as a troop of soldiers, just as Bewick has described a set of lads. Of course, there was not an ass that could be caught on the common or in the lanes that was not pressed into our service, and he that can set an ass a-going against his will, and stick on his back too, is no mean rider. Every one that has made the experiment knows, and he only, all the cunning and the tricks of that reputedly stupid animal. First, you are saluted as you approach it with the most admirably directed kicks. Whichever way you approach, you find the tail and heels of the animal presented to you; or if there be several lads endeavouring to hem him up in a corner, without which I hold it a moral impossibility to catch a good knowing ass at all, the head and heels seem to present themselves very wonderfully towards three-fourths of the company, and the rest are treated to those side lunges and open-mouthed snatches, that require the quickest eyes and the nimblest heels to get out of the way of.

But suppose the great act of securing and mounting accomplished, the next great act is to move him. Bewick has shown you, in a ragged lad standing at the ass's tail, with a formidable gorse bush very skilfully applied, the most efficacious of all modes of propulsion: but, this once attained, then indeed is the moment of real difficulty. Off goes the ass for a few paces, then backward he goes as fast, then sideways as rapidly—this way, that way, and then down goes his head to the ground, and up go his hind feet into the air. He that can sit through all these evolutions can sit through anything. And, if he has sate through them, let him still be alive, for the next thing will be for the ass to lay himself leisurely down, and as leisurely begin to roll himself over. This is his last resource, if he does not see a pool that he can run into, where he will remain very quietly for at least half a day with his rider; or, if he does not see a good post or trunk of a tree, or a rough hedge, or a wall, that he can deliberately grind the boy's legs against. Cris Newton will remember his experience of wall-grinding as long as he lives.

Besides asses, rams and swine have been occasionally tried by adventurous lads; but I must confess that they never were any favourites of mine. By far the most successful practice that I and my village mates enjoyed, was in riding to the water—a pool about a quarter of a mile off, where they were taken because they had the double advantage there of drinking and getting their legs well washed—the sober set of horses that used to turn the gins or great wheels at the coal-pits. Regularly every summer evening we presented ourselves at the stable-door, and old Samuel Davis, the groom, used to lift us on by the leg, and give us the halter in our hands, for that was all we had to guide them by, and away we went on their bare backs. Now, regular work kept those

horses steady enough, and some of them were grown old in the service: the younger ones had backs as broad and soft as cushions, but Old Jack, a white horse at least twenty years old, had a back-bone as high and sharp as any one would desire to sit upon. Samuel Davis said it resembled most in his mind the riding on a razor. However, we were not particular. There were about half a dozen horses, and, when we set out, one lad on each; but by the time we got to the pool, there were often at least half a dozen lads a-piece on some of the easiest-backed ones; for as we went through the village, every lad came running, crying, 'let me ride,' and 'let me ride;' and up the fore-legs of the horses they crept, and were pulled forward by those already on. Sometimes we sat all one way, sometimes the other; that is, sometimes with our faces to the horse's head, and sometimes towards the tail; and sometimes we stood straight up upon their backs, which indeed on Old Jack's back was by far the easiest position. There was one roguish horse, however, Black Bob, that was a bit of a wag, and when we were in the middle of the pool would sometimes begin to paw, and then quietly lay himself down in the water, spite of all our kicks and thumps and cries. When he began to paw the water, there was nothing for it but to bring one of the other horses alongside of him in a moment, and let the lads scramble off Bob's back upon it, or otherwise they were sure of a good ducking; and yet it was odd enough that Bob was as much in request as any horse of them all.

But the day came when Peter Scroggins, the grey pony, made its appearance; and there was an end of mounting gates, stiles, boughs, dogs, or old horses; nay, even a very quiet and ancient cow that I used sometimes to back as I fetched the cows up to be milked, presented no charms. Peter was the horse every where and on all occasions. On one only occasion was he eclipsed, and that was by a most beautiful cream-coloured pony with a fine long tail, which my father bought, when, and where, and wherefore, I know not, except it were that he had somewhere been struck with its extraordinary beauty, and had a notion of substituting it for Peter. My delight in this lovely creature was unbounded; and what delighted me more than all, was to discover that whenever I stopped, it immediately reared up as straight as an arrow on its hind legs. This was to me the greatest amusement; and that every body might see and enjoy this peculiar feat, I rode it up repeatedly into the front of the house, and there let it rear to its full contentment; a measure by which I very likely saved my neck or my bones, for it would probably, before long, have tumbled over with me, and very likely upon me. My father was so much satisfied with what he saw, and my mother so much more so, that the cream-coloured beauty was speedily disposed of, and Peter Scroggins restored to his wonted favour."

JUGGLERS OF INDIA.

THE conversation of a friend, recently arrived from India, enables us to notice one or two of the surprising performances of the jugglers of that country, which, though familiar to persons acquainted with eastern matters, may be new to many readers of these pages.

A party of jugglers came forward on one occasion to perform publicly in the yard of the barracks at Madras. Many hundreds of people, of all kinds, ages, and denominations, including the soldiery of the establishment, assembled to witness the exhibition, and some little temporary arrangements were made, that all might see and hear conveniently. The leader of the jugglers, who were all, of course, natives of Hindostan, requested the commanding officer to place a guard of men around the scene of display—a precaution which was adopted, and which proved a very wise one. The floor of the court, be it observed, was composed of sand, firm and well trodden. On this ground, then, after some preliminary tricks of an inferior kind, one man was left alone with a little girl, the latter seeming about eight or nine years old. Beside them stood a tall narrow basket, perhaps three or four feet high, by little more than a foot in width, and open at the top. No other object, living or inanimate, appeared on the ground. After a short period, spent by the man in conversing with the girl, he seemed to get angry, and began to rail loudly at her for her neglect of some wish of his. The child attempted to soothe him, but he continued to show an increased degree of irritation as he went on. By degrees he lashed himself up into such apparent fury, that the foam actually stood upon his lips, and, being naturally of an unprepossessing countenance, he looked, to the white spectators at least, as like an enraged demon as might be. Finally, his wrath at the girl rose seemingly to an uncontrollable height, and he seized her, and put her beneath the basket; or, rather, turned down the open mouth of the basket over her person. She was thus shut entirely up, the turned bottom of the basket closing her in above. Having thus disposed of the child, in spite of her screams and entreaties, the man drew his sword, which was as bright as the surface of a mirror, and he appeared as if about to wreak some further evil on the object of his ire. And after some moments, during which he talked to himself and to the enclosed girl as if justifying his anger, he did actually at length plunge the sword down into the basket, and drew it out dripping with blood, or at least blood-red drops! The child screamed piteously from her prison, but in vain; for the man plucked the weapon again and again into the scene of her confinement. As he

did so, the cries of the girl became faint by degrees, and in the end died away altogether. The deed of death was consummated!

So, at least, thought most of the horror-struck persons who witnessed this action. And well it was for the chief performer in it that he had requested a guard to be placed, for it required all the exertions of this guard to prevent the aroused soldiery, who believed this to be no trick, but a piece of diabolical butchery, from leaping into the arena, and tearing the man to pieces. The excitable Irishmen among the number, in particular, ground their teeth against one another, and muttered language not very complimentary to the juggler. Even the officers, whose better education and experience made them less open to such feelings, grew pale with uneasiness. But observe the issue of all this.

When the man seemed to have carried his rage to the last extremity, warned, perhaps, by the looks of the soldiery that it would be as well to close the exhibition without delay, he raised his bloody sword for a moment before the eyes of the assemblage, and then struck the basket smartly with it. The basket tumbled over to a side, and on the spot which it had covered, in place of the expected corpse of the girl whose last groans had just been heard, there was seen—nothing! Nothing but the flat sand of the courtyard! No vestige of dress, or any other thing to indicate that the girl had ever been there! The amazement of the spectators was unbounded, and it was, if possible, rendered more intense, when, after the lapse of a few seconds, the identical little girl came bounding from the side of the courtyard—from among the spectators' feet, it seemed—and clasped the juggler round the knees, with every sign of affection, and without the slightest marks of having undergone any injury whatever. As we have said, the astonishment of the assembly was immeasurable; and it might really well be so, seeing that the feat was performed in the centre of a court, every point of the circumference of which was crowded with spectators, whose eyes were never off the performers for one instant. As to the notion of a subterranean passage, the nature of the ground put that out of the question, and, besides, that nothing of that kind existed, was made plain to all who chose to satisfy themselves on the subject, by looking at the scene of the performances when they had closed. Every one was sure that the child had been put below the basket, and that she did not get out of it in the natural way. But she did get out; and how! It is impossible to say, though there can be no doubt that it was accomplished by some skilful manoeuvre.

A somewhat similar feat is occasionally performed with animals. A juggler will place a lean dog below one of these baskets, and presto, pass! when he lifts it up, you will behold a litter of as fine pups as ever whipper-in could desire. But most people will probably think the tree-trick a more wonderful one than any of these. A juggler, in performing this, chooses either a small spot of earth, of the extent of two or three feet square, and in the open air; or he takes a large flower-pot, and fills it with mould for his purpose. Either of the ways will do. Having this small plot of earth before him, and his spectators ranged around, at the distance of two or three feet, the juggler shows to the company a mango stone, or the stone found in the centre of the eastern fruit known by that name, which varies in size from that of an apple upwards. This stone the juggler then plants in the earth, at the depth of several inches, and covers it up. Not many minutes elapse until the spectators behold a small green shoot arise from the spot. It increases visibly in height and size every moment, until it attains the altitude of a foot or so. It then begins to send off branches from the main stem; on these branches leaves begin to appear, bearing the natural hue of vegetation. Buds next present themselves; the whole affair, meanwhile, assuming the regular aspect, in every particular, of a miniature tree, some four feet high. The buds are followed by blossoms, and, finally, the green fruit of the mango meets the astonished eyes of the spectators. "Look, but touch not," is all this time the juggler's word, and he himself also preserves the character of an onlooker. When the fruit has arrived at something like a fair growth for such a tree, the originator of this extraordinary vegetation plucks it, and hands it to the spectators. This is the winding up of the charm. The assembled persons handle the fruit, and see nothing in it in the slightest degree different from the ordinary produce of the mango, elaborated by the slow vegetation of months. Our informant on these points ate a portion of the fruit brought forth by this jugglery, and found it to taste exactly like the raw mango. The whole process, now detailed, usually occupies about a quarter of an hour, from the planting of the stone to the production of the fruit. Though he gives away the fruit, the performer does not part with the tree. This feat, which is perfectly familiar to all who have been in India, is certainly an extraordinary one, and affords the most effectual evidence of the powers of deception to which the race of jugglers has attained.

The feat of sitting without seeming support in the air, is one of the few first-rate Indian tricks which have been exhibited in Europe; but even this is now held somewhat cheap, the mode of performing it being pretty clearly understood. The feat is performed in this way. In the centre of a ring of spectators, stands the juggler with an assistant. When all is ready for

the performance, the assistant holds an ample cloak, or awning, over the juggler, which covers him completely for the time. In a few minutes this covering is removed, and the juggler is discovered, seated cross-legged in air, unsubstantial air, at the height of a foot or so from the ground! He is in the thin dress of his country, and on one of his arms, which is extended horizontally in a bent form, and which, as well as the other, has a wide sleeve upon it, a fold of a cloak is negligently thrown, the remainder of the cloak hanging down to, and resting on, the ground. This slight contact of the elbow with the cloak is all that connects the man with terrestrial things. Otherwise, he is totally left in air; and how he maintains himself there, is inexplicable to appearance. But the cloak alluded to seems to lie in careless contact with another cloak, or portion of attire, that rests on the ground farther off. Now, it is believed that, at the point where the cloak touches the elbow, a spring of a very powerful kind passes up the sleeve of the arm, and bends down under his body, placing him probably upon a hoop. The other end of the spring passes off, and finds its support under the second or farthest off cloak. This spring, in all likelihood, can be folded up into short divisions, so as to be easily concealed while the awning is thrown over the juggler at the close of his performance, and before he gives liberty to the spectators to examine the spot, which he usually does. This is the received explanation of the feat, but there is still some difficulty in understanding the nature of the weight or support which is placed beneath the cloak. This must evidently be of considerable power to sustain his frame; and how he gets it out of the way, is not easily seen. These feats are the result of surprising art, address, or contrivance; and for such, the natives of India certainly far excel the whole world.

A FEW WEEKS ON THE CONTINENT.

ANTWERP, GHENT, OSTEND—RETURN TO ENGLAND.

HAVING spent a few days agreeably in the Belgian capital, we proceeded on our route to Ostend, by way of Antwerp, in which we designed to spend a day in passing. Our journey to Antwerp was speedily performed by means of the railway train, which in less than a couple of hours brought us to the place of our destination.

In travelling from Brussels to Antwerp we proceed in a northerly direction, passing through the pleasantly situated and thriving town of Mechlin or Malines, celebrated for its manufactures of lace. After quitting Malines, we are made sensible of approaching the low-lying coast of the country. The land assumes all the appearance of polders reclaimed from the sea, the ditches are full of water, and canals are seen on the tops of the broad mounds or dykes. Rich green fields devoted to the pasturing of cattle, the neat farmsteadings of the Flemish peasants, and church steeples projecting from the midst of clumps of leafy trees, all serve to remind us of Holland. The first indication we have of approaching Antwerp, is the sight of the tall Gothic tower of the cathedral, rising from the verdant plain before us. The town itself is concealed from view till we are close upon it, by a number of outflanking bulwarks, in the form of high grassy mounds.

Antwerp, or Anvers, as it is called by the French and Belgians, is strongly guarded on the east and south by high walls and deep wet ditches; on the west it has the fortification called the citadel, and on the north it is bounded by the Scheldt, a river as broad as the Thames at Blackwall, and as capable of navigation. The Scheldt, after passing the town, flows in a northerly direction to the sea at Flushing—a distance of sixty-two miles. The whole country around is perfectly flat. Immediately opposite Antwerp, on the left bank of the river, stand a few houses, fortified by walls, and forming a station for a ferry: this is the Tête de Flandre. Behind this fortified station there is a large flat expanse of land, bare, brown, and marshy, and which could be easily flooded. Plantations of trees border the horizon in the distance.

The interior of Antwerp consists of generally narrow streets, lined with high houses of a sombre antique appearance, and obviously built according to the old Spanish taste. In niches on the projecting angles of some of the houses forming the corners of the streets, are seen large gilt wooden figures of the Virgin and Child, which may be assumed as an evidence that the town is purely Roman Catholic. It was the first time we had observed such representations in the open thoroughfares in Belgium, and we learned that they were generally falling into a state of neglect. Nothing of the kind, at least, was seen by us in Brussels. Some of the streets contain houses of a modern architecture, and there are some good shops; but the air of the whole place is decidedly prison-like and monastic. We observed that many windows were stanchioned with iron bars, and that some of the doors of the houses had small open-

ings in them, covered with gratings, through which the inmates could spy those who demanded admittance, and thus protect themselves from violent intrusion. Antwerp has been so frequently attacked and taken possession of by Spaniards, French, English, and Dutch, that those, and such like evidences of a state of turbulence, can excite no surprise. I know of few towns in western Europe which have suffered so much from war as Antwerp. Previous to the disastrous reign of Philip II., it was the greatest commercial city in the world. From two to three thousand vessels were constantly in the Scheldt, loading and unloading cargoes of goods, five hundred waggons entered the gates daily, and the inhabitants amounted to 200,000 in number. The dreadful severities of Alva drove thousands of the merchants and artisans to England; and when the Dutch finally made their peace with Spain in 1648, the last great blow was given to the trade of the town, it being then settled that the Scheldt should in future be closed against the entrance of shipping. After this, Antwerp dwindled down to the condition of a poor neglected town, known only for its churches and the pictures which ornamented them. Napoleon, having conceived the plan of making Antwerp the greatest of the French naval arsenals in the northern part of his empire, if not a rival of the port of London, for both of which it was eminently suited, greatly improved the town by constructing a beautiful quay along the bank of the river, also two large docks for the reception of shipping, and a complete suite of ship-building yards, an arsenal, and other important accommodations. At the peace of 1814, by the treaty of Paris, the whole establishment was broken up, the storehouses and docks ordered to be demolished, and the shipping and materials divided between the French and Dutch. These measures were forthwith carried into effect, with the exception of the destruction of the docks or basins, those being spared at the anxious solicitation of the citizens, who wished to preserve them for their trading vessels. These basins are situated within the eastern boundary of the town, and possess commodious entrances from the Scheldt. In winter, when the river is apt to bring down masses of ice, they serve the important purpose of protecting the shipping from injury. The quay forms a most agreeable promenade; when we visited it in the evening, we found hundreds of persons enjoying themselves in walking, or sitting on benches at the doors of the houses. Only a few vessels lay in the river or alongside the quay; altogether the number did not exceed seventeen, exclusive of barges, and a steam-vessel which was to sail next day for London. The trade of the town, which suffered by the events of the revolution of 1830, is, we were told, improving; and there can be no doubt that when the railway is completed to Cologne, a very considerable revival of traffic will be experienced. The town now contains about 77,000 inhabitants.

Being desirous of visiting the interior of the citadel of Antwerp, rendered famous by its protracted siege in 1832, we were fortunate in procuring a recommendation to the officer in command, and were therefore admitted on presenting ourselves at the entrance. I had expected to see something like a castellated fortress, and never was more surprised than when we were brought in front of certain green mounds, over the tops of which nothing could be seen. Pursuing a crooked path between the mounds, we are led by a wooden bridge across a broad wet ditch, thence through a covered way, which opens on another ditch beyond; having crossed that, we enter another vaulted passage in the walls, and are shortly in the interior of the garrison. Previous to the bombardment, the interior contained a populous village and church, besides barracks and storehouses. The whole of these were completely destroyed, and at present the visitor perceives only an open space, or smooth grassy park, with two or three recently-erected houses for the soldiery. During the siege, the French artillery fired sixty-four thousand shots, including nearly twenty thousand bombs which were thrown into the garrison. The Dutch are proud of the defence made by Chassé on this occasion; but as it could not, and really did not, tend to any useful purpose, we may be excused for viewing his conduct, or that of the parties for whom he acted, only as an example of irrational obstinacy.

Antwerp is usually styled the cradle of the Flemish school of painting, and it is more frequently visited for its treasures in this branch of the fine arts than for the inspection of the many scenes of historical interest by which it is surrounded. From the window of our hotel we looked across the Alée Verte, an open place lined with rows of trees, to an object which would have charmed the eye of an architect. This was the cathedral, with its tall elegant square tower, and richly decorated transepts, raised in airy proportions above the level of the houses in the Place. The cathedral of Notre Dame of Antwerp is one of the largest and finest specimens of the Gothic style of architecture now existing in the Netherlands. It was commenced in 1422, and finished in 1518, the building having thus required ninety-six years. Properly speaking, it was never finished according to the original design, two towers were intended to be raised at the east end of the edifice; but only one, that on the right of the main doorway, has been erected, the other being cut short and brought to a point a little above the roof of the church. Notwithstanding this deficiency, the building is a wonder of architectural beauty, although almost entirely hung round with paltry parasitical structures

occupied as shops. The interior is one entire open sweep from end to end, except an inclosed space in the choir, containing the grand altar. The side aisles are occupied as chapels, each with an altar and pictorial embellishments. Entering by the door in the northern transept, and advancing a few steps, we have the vast open expanse before us, the choir on the right and the ample nave on the left. On the wall of the transepts on our right, one on each side of the choir, hang the two pictures of Rubens, which artists have made pilgrimages to visit for the last two hundred years. The first we come to is the Descent from the Cross, a picture justly esteemed as the masterpiece of Rubens, and which is in some degree familiar to the whole civilised world, in consequence of having been so frequently copied and engraved. The figure of the dead Christ, in the process of being lowered from the cross, is exceedingly faithful to nature, and forms the central and most striking object in the piece. The picture has two wings to fold over it, and on these are representations of the Salutation and Purification. We went to see this great production six times during our stay in Antwerp—the church being always open—and always with increased delight. The companion to the picture on the wall of the farther transept, represents the Elevation of the Cross, the body of Christ being seen nailed to it, while a number of figures are exerting themselves in raising it into its place. This piece, though less celebrated, is not less remarkable for fidelity of drawing than the other. The Assumption of the Virgin is a third picture by Rubens, placed over the grand altar; and a fourth, representing the Resurrection of Christ from the tomb, is pointed out in one of the side chapels. It would be an oft-repeated tale for me to make a single remark on these admirable productions. Nearly two hundred and fifty years have elapsed since they were painted; yet they are still in a good state of preservation, though a little faded and old in their appearance, and the substance on which they have been painted exhibits a few cracks. Before quitting the edifice, we mounted to nearly the summit of the tower, whence a view was obtained, including the borders of Holland, Breda, and Bergen-op-Zoom, on the east, Brussels on the south, Ghent on the west, and the verge of the sea at Flushing on the north. The tower is 466 feet in height; it is at present, along with the eastern entrance, undergoing considerable repairs. General Chassé, it will be recollected, threatened to fire upon it from the citadel, in consequence of its having been made a station for peeping down upon his operations during the siege; fortunately, means were found to prevent him from fulfilling a threat, which, if executed, would have occasioned a public misfortune to all Europe.

We visited a number of other churches noted for pictures of Rubens, Vandyke, and other eminent artists, also for carvings in marble and oak, some of which, such as rails to altars twisted with garlands of flowers sculptured in pure white marble, were among the most elegant works of art which had ever come under our observation. The museum of Antwerp was likewise visited in the course of our ramble through the town. It contains a collection of pictures from suppressed churches and convents, including fourteen productions of Rubens; but though these have commanded universal admiration, we could not look upon them with any degree of complacency. There is a certain point, beyond which, in examining representations of crucifixions, martyrdoms, and other physical sufferings, the mind becomes bewildered with the reiteration of horrors, and the spectacle ceases to please. This point we had now gained, and were glad to make our escape from the collection into the open air.

Decayed as Antwerp seems to be, it is not without symptoms of liveliness and wealth. Lately a new theatre was erected; it is on a large and tasteful plan, fully equal to some of our best English establishments, and has a body of good actors. The dialogues are in French, as in the theatres at Brussels. The Bourse, or Exchange, where in days of yore five thousand merchants congregated daily, is an elegant old structure, with a central court and piazzas, which formed a model for the erection of the Royal Exchange in London. It is unfortunately placed in a confined situation, but is still resorted to for the purposes to which it was originally destined.

Living is said to be cheap at Antwerp. I inquired the price of beef, and other articles, which I found were much lower in price than in England, or even in the cheapest districts of Scotland. The price of bread may be readily learned in Holland or Belgium, as every baker is obliged by law to hang up a tariff of prices weekly over his door, for the public perusal. Bread is baked of six qualities, marked A, B, C, D, E, and F, and opposite each the charge per pound weight is inserted. The price, during my visit, varied from 8 to 18 cents per pound (there are 100 cents in 10d. English), which was considered to be more than usually dear.

We proceeded in a few hours by the railway to Ghent, at which living is generally allowed to be cheaper than at Antwerp. As we approach Ghent, the country appears more densely peopled than in the eastern provinces. The villages, embowered among trees, quickly succeed each other, and we pass different walled towns and localities celebrated in the wars of Marlborough. Ghent occupies a favourable situation for commerce, in the midst of the richest and most beautiful part of Flanders, on the banks of the Scheldt,

Lis, and Lieve, which here unite, and with their innumerable ramifications in the form of deep canals, pass through the town. The appearance of Ghent is very much like that of the Dutch towns, in which the walls of long rows of houses seem to grow out of the water; and hence, however well adapted the town may be for trade, I cannot conceive it to be suitable as a place of residence for persons accustomed to a dry climate. I believe that Ghent has upwards of a hundred bridges.

Ghent is the ancient capital of Flanders, and in its days of glory prior to the Spanish oppression, it was as populous and wealthy as Antwerp. At the commencement of the fifteenth century, it was distinguished as the chief seat of the cloth manufacture on the continent, and contained 40,000 weavers. These formed the strongest and holdest corporation of craftsmen in Europe, and to their invincible love of freedom are we owing much of the constitutional liberty which we now enjoy. The town, it is almost needless to relate, was effectually ruined by the measures of Charles V. and his son Philip II., and its revival is only of comparatively recent date. In 1801, the cotton manufacture was introduced into it by a native who had received instructions at Manchester, and succeeded in a very remarkable manner. There are now a number of cotton factories driven by steam-power, the indications of which, in the shape of tall brick chimnies, appear in all directions. The situation, on canals which bring the raw material to the very doors, the large population of the place (80,000), among whom are many poor, and the cheapness of living, render it advantageous for this or any other species of manufacture on a large scale. The railway to Ostend on the one hand, and to Liege and the Rhine on the other, must in time accelerate the progress of the town in all branches of traffic.

The spectacle of cotton-spinneries placed amidst rows of antique buildings, old gloomy churches, and monasteries, is at variance with our ordinary conceptions of social improvement. We passed from the contemplation of spinning-jennies moved by steam-engines to that of an object of an entirely different character—the cathedral or church of St. Bavo, an edifice of the thirteenth century, enriched with twenty-four chapels, and possessing some carved rails and sculptures in marble, executed in a style of exquisite beauty. Before the grand altar in the choir stand four massive silver-gilt candlesticks, each at least five feet in height. They originally belonged to St. Paul's in London, and were sold during the protectorate of Cromwell. The tower of the cathedral is less conspicuous in the town than an isolated square turret, which is called the Belfry, and was anciently used as a post of outlook by the citizens. Its date is 1183. On the summit is a gilt dragon, which was originally brought from Constantinople during one of the crusades, by a detachment of the citizens of Bruges. At the conquest of Bruges by the inhabitants of Ghent—these towns were always fighting against each other—in 1445, the gilt dragon was carried off as a trophy, and has been here ever since.

Wandering from church to church, we at length came to the conventual establishment called the Béguinage. This is a very curious place. It consists of an entire square surrounded with houses, with a church in the open space in the centre; also several lanes lined with houses—the whole being enclosed, and entered by a single gateway. In front of the houses there was a secluded wall, in which were doors leading to the respective dwellings. Each door had inscribed upon it a particular motto or saint's name, by which, in all probability, the dwelling within was known. All these houses are residences of nuns, and the number of the establishments must be nearly one hundred—the whole, indeed, form a distinct town of nunneries. There were lately six hundred inmates, of whom we saw several, both here and on the streets, in their black stuff garments, and white head coverings; they were all elderly women, of a respectable appearance, and I was informed that they devote themselves to the duty of sick-nurses, and are to be found wherever there is either sorrow or suffering. Some are ladies possessing considerable wealth, and to these others act as attendants or domestics, but all meet on an equal footing in the religious services of the church. They are bound by no vow, as other nuns usually are, and may therefore be described as single women of a religious turn of mind, who devote themselves to works of charity and mercy.

Ghent contains a university, which was founded by William when king of the Netherlands; also a botanic garden, and several educational establishments, including a school of arts. It likewise possesses a Casino, situated in a pleasing part of the environs, and at which musical entertainments are given: it is surrounded by a garden for the recreation of visitors during fine weather.

Having spent a day in Ghent, we passed onward by the railway to Bruges, and thence to Ostend. This journey used formerly to be accomplished by a treck-schuit on the canal, and was exceedingly tedious. By the railway train we were whirled along at a rapid rate, and at a very small expense. For a sum not exceeding four or five shillings, the traveller may now be transported from Ostend or Antwerp to Brussels; and as steam-vessels sail regularly from London to both of these ports, all difficulty of reaching the Belgian capital from England has vanished. The railway from Ghent to Ostend proceeds directly through

a suburb of Bruges, a number of houses having been taken down to admit the line of road. In passing, we were a little amused at seeing a monk or friar in his brown tunic, with shaven crown and beads, standing in the gap of one of the destroyed buildings, contemplating the ruin which had been made: the line, we were told, had cut through the centre of his monastery.

Bruges is a town of great antiquity, and has been less benefited by the revival of commerce in modern times than any other of the old Flemish cities. The streets, which are neat, clean, and dull, possess many remarkable edifices of antique Spanish architecture. The place is chiefly known in the present day for its retired character and its suitability as a place of living for those English who wish to make slender incomes go a great way in housekeeping.

On approaching Ostend, at the distance of sixteen miles from Bruges, we perceive before us the long line of rough sandy hillocks which the winds have brought up from the sea-shore, and in the midst of these dreary wilds is built the town of Ostend, an opening being left for the entrance of the sea into the harbour. Ostend, which is strongly walled and defended, is a regularly built plain town, not over cleanly, and contains about 30,000 inhabitants. The entrance to its port is a flat sandy beach at low water, and hence it is badly adapted for shipping, at least for steam-vessels, whose passengers cannot brook delay. We nevertheless found the harbour full of shipping, and a general appearance of traffic. The number of vessels which had entered the port during one month previous to our visit, was 85, with a burden of 10,441 tons. As a place of residence for strangers, Ostend is in no respect fitted. Like all other travellers, we remained in it only so long as was absolutely necessary. By one of the excellent Post-Office steam-packets we proceeded on the morning after our arrival across the Channel to Dover, which we reached in seven hours.

NOTE.

The narrative of my excursion in Holland, the countries on the Rhine, and Belgium, has now been brought to a conclusion, not without fear that I have tired the patience of the reader. My object has been to describe simply what I saw, avoiding as far as possible matters of trivial detail, or those which have been previously described, and taking care to express no rash opinion on the subjects which came immediately under my observation. As respects the important subject of education in Holland and Belgium, which chiefly engaged my attention, I have, for the sake of brevity, excluded a number of illustrations and remarks; these, however, with some other additions, will be given to the public in a revised edition of my tour, which will appear, in the form of a volume of small compass, in the course of a few weeks.

W. C.

CONDITION OF THE LOWER CLASSES IN A GREAT CITY.

THE Report of the University Hospital and Dispensary of Glasgow for 1837, recently read at an annual meeting of the subscribers, where the Principal of the university was in the chair, affords some valuable light on what is to most persons a subject of a very obscure nature, the circumstances in which the great bulk of the labouring classes of a large city live. Of the correctness of this Report, we presume there can be no doubt, as it is drawn up under the care of intelligent and every way respectable individuals, who are in the constant habit of visiting the sick poor at their own houses. "The tales of distress," says the Report, "sometimes told at the dispensary, and the visits made to the sick poor at their own houses, have directed the physician (Dr Cummin) to several circumstances in the condition of the working classes of this city, to which it may not be improper to advert, as they have a considerable influence over the health, as well as the morals, of these people. The bye-streets, lanes, and alleys of the city and suburbs of Glasgow, are, with few exceptions, exceedingly ill paved, therefore very difficult to be kept clean. They are also very badly lighted, and some of them altogether without lamps, while the attention of the police is directed chiefly to the main streets of the town, neglecting the poorer and more obscure districts. The effect of such a state of matters on the health and moral habits of those people cannot be otherwise than highly injurious.

Many of the dwellings of the labouring poor are quite ruinous, unfit for lodging human beings, and such as would be condemned by any board of inspectors. Their dwellings are not only very wretched, but the rents paid for them are exorbitantly high, partly from the small number of houses for the poor, and partly from the difficulty of collecting the rents. Single rooms are sometimes let for five pounds a-year, and miserable cellars for two or three. The rents are collected by the fortnight, or even the week, and sometimes even in advance; thus, the rents paid by the labouring people are exceedingly high, and charged at the rate of thirteen months to the year. Great numbers of the labouring poor, consisting of different families, are often crowded together in one apartment, with little regard to the distinctions of age and sex; and the consequences, as might be expected, are highly prejudicial to the health and to the moral feelings and habits of the individuals. The want of proper dwellings for the poor, and the high rents exacted for those which they now occupy, naturally suggest the idea of forming building societies, for supplying the deficiency at more moderate charges: and there seems

no reason to doubt, that, by judicious management, these objects might be successfully attained without any considerable pecuniary sacrifice, or perhaps even with some small profit.

The indigent condition of the lower classes, and the miserable dwellings into which they are huddled, oblige them to purchase their provisions and fuel in small quantities, sometimes on credit, and therefore at prices which would be deemed quite exorbitant by the wealthy inhabitants of this city. Hence their small pittance of wages becomes still less adequate to the supply of their reasonable wants. The indigence of the labouring classes in Glasgow is much greater than the rest of the community are aware of—a very small interval indeed separates them from complete destitution, which is immediately produced by the sickness of the head of the family, or his want of employment. It would be a melancholy and painful subject of statistical inquiry to endeavour to ascertain how many individuals in this great city, with all its masses of wealth, get up in the morning without knowing where they are to find a meal, and how many actually cannot obtain food without having recourse to begging or theft. The wretchedness of the houses occupied by the labouring classes where they are crowded together in such numbers, causes them to congregate together in the streets after the day's work is done, or if they have a few pence, it leads them to the tavern or drinking shop. Few of them, in fact, can afford to enter a tavern; they are obliged, therefore, to swallow their glass of spirits in some open shop, lounging by the counter, or against some bench or empty cask. The vice of intemperance is indeed making frightful advances among the lower classes of our population of both sexes, and it has proved the most powerful of all the causes of their demoralisation and misery, and the prevalence of disease. Even the children are taught to suck in the poison; several instances have occurred at the dispensary where mothers and nurses have confessed the practice of giving ardent spirits to infants, and on one occasion the writer of these remarks saw a wretched woman in a dram-shop give a little girl of five years the glass, to drain from it the last drops. But if we look well into the condition of the working classes, the temptations held out to them, and the facilities of obtaining ardent spirits, we shall perhaps be inclined to censure them with less unsparring severity.

Go where we choose, in every quarter of this vast city numerous shops for the sale of ardent spirits are to be met with. No sooner is a new building erected in the place of some ruinous edifice, than splendid shops are immediately opened in it for the retail of intoxicating liquors. In the streets most frequented by the poor, they are to be seen brilliantly illuminated with gas, even at the early hour when the cotton-mill workers are repairing to their factories. It is not, therefore, matter for wonder that these poor people, scantily clothed, and shivering in the morning air, should be tempted to warm their stomachs with a glass of spirits; for nothing which they can obtain at that hour, and for the small sum which they can command, will produce the same grateful feeling. It would be a wise employment of the funds of temperance societies, if, instead of printing tracts which are seldom read, or establishing coffee-houses for those in better circumstances, they were to open small shops for the poor, where they might at all times obtain for a trifle hot broth, hot tea, or coffee, or chocolate, or ginger tea, or a glass of hartshorn cordial, such as would be useful in weaning drunkards from their vicious habits. Much benefit would also accrue from such an increase of the malt duty, and the duty on distilled spirits, as should render them less easily obtained. Petitions from the intelligent classes of the community, calling on the legislature to stay the progress of intemperance by such means as these, could not fail to be listened to. Perhaps one cause of the intemperance of the working and lower classes in Scotland, is the want of those recreations and spectacles which they enjoy in some other countries; in corroboration of which it may be remarked, that on the occasion of the rejoicings for her present majesty's coronation, when the people were treated with various shows and innocent entertainments, less intoxication was observed both in this city and in London, than at any former similar festival. If we could succeed by the means which have now been proposed, or by any other, in materially ameliorating the condition of the labouring classes, and in checking the diffusion of intemperance, there is good ground for believing that disease would be less frequent—that crime of every description would diminish—and that the soil would be found prepared for the labours of the ministers of religion, which, it is admitted, are now so deplorably unsuccessful in extending the blessings of Christianity among the lowest ranks of our population."

* We take the liberty of dissenting from these proposals. It is well ascertained, that if the duty on spirits were raised, the business of illicit distillation would immediately commence. The true way to eradicate habits of drunkenness consists neither in raising at spirit-dealers, nor at low duties on liquors, for these are but results of a cause. We must abolish the cause, and then the results will disappear. The true plan will consist in cultivating the minds and improving the physical condition of the people; unless this be done on a scale only limited by the extent of the whole nation, habits of intemperance and disregard of the decencies of life, will, as a matter of course, continue to flourish.—*Edin. C. J.*

SCRAPS FROM AMERICAN PAPERS.

As collected in New York Mirror and New Yorker.

SELF-MADE MEN.

You may take the whole population of Maryland, and select from it the fifty men who are most distinguished for talents, or any description of public usefulness, and, I will answer for it, they are all, every one of them, men who began the world without a dollar. Look into the public councils of the nation, and who are they that take the lead there? They are men who made their own fortunes—self-made men, who began with nothing. The rule is universal. It pervades our courts, state and federal, from the highest to the lowest. It is true of all the professions. It is so now; it has been so at any time since I have known the public men of this state or the nation; and it will be so while our present institutions continue. You must throw a man upon his own resources to bring him out. The struggle which is to result in eminence is too arduous, and must be continued too long, to be encountered and maintained voluntarily, or unless as a matter of life and death. He who has fortune to fall back upon will slacken from his efforts, and finally retire from the competition. With me it is a question whether it is desirable that a parent should be able to leave his son any property at all. You will have a large fortune, and I am sorry for it, as it will be the spoiling of a good lawyer. These are my deliberate sentiments, and I shall be rejoiced to find, in your instance, that I shall have been mistaken.—*Clement Falconer.*

CROCKERY, Delf, AND CHINA.

A lady, proud of her rank and title, was one day decanting on the superiority of the nobility over the rest of mankind, to a large company of visitors. Says she, "I think we may very well compare the three classes of people, nobility, gentry, and commonalty, to the three classes of tea-drinking utensils, china, delf, and crockery." A few minutes elapsed, when one of the company expressed a wish to see the lady's little girl. "Tell the maid, John," said she to the footman, "to bring the little dear." The fellow, wishing to expose his mistress's ridiculous pride, cried, loud enough to be heard by all the company, "Crockery! bring down little China."

LIVING UPON AIR.

A queer idea has somehow got abroad that periodical proprietors, paper-makers, printers, pressmen, and all the multifarious, viviparous, warm-blooded animals connected with publishing matters, share the properties of the camelion. There can be no greater mistake than this. Whatever theories may exist upon the subject, it is a well-ascertained fact that none of these classes of people are exempt from the ordinary laws of humanity, but are compelled, in order to preserve their vitality, to repair the waste of nature from time to time with substantial aliment. But this zoological absurdity is not more preposterous than another dogma which seems to obtain among some of our delinquent agents and subscribers. They seem to think that a periodical is one of the lower order of vegetables, which, when once planted, grows and flourishes of itself, and drops its blossoms and fruits at their door without any expense of care and culture. How such a stupid belief can obtain currency among people so enlightened as the readers of the Mirror, we are wholly at a loss to determine; but we earnestly hope that every one of our subscribers to whom the suspicion attaches of sharing such laughable ignorance, will at once exonerate himself, and prove his undoubted intelligence by forwarding the funds, which will enable us to go on cheerfully, administering to his entertainment and delight in these columns.

THE BEST WAY TO TEACH.

It was once said by the French philosopher Diderot, "that the best way to educate a child is to tell it stories, and let it tell stories to you." There is so much true philosophy in this remark, that we will extend it a little. There is a school-room education, and an ambulating or walking education; the one is obtained out of the book on the bench, the other from walking among and talking of things. And we believe that this out-door instruction has been too much neglected; education having been conducted on the principle of looking out of the window at things, instead of visiting objects, and learning their properties and uses. The student, for example, looking out of his college window at the horse, can give five or six names to the animal: one in Latin, one in Greek, another in German, and then the French name, &c. The stable boy can give but one name; yet which knows the most of the properties, nature, disposition, and uses of the horse? Education consists too much in merely naming things, when it should relate more to their properties and uses. It should connect words with ideas, and ideas, as much as the nature of the subject will allow of, with objects. If we instruct children orally while visiting nature, words, ideas, and objects, will naturally be more in connection with each other than the school-room lesson can make them. And the teacher should take occasion to instruct in the fields, in ship-yards, in the crowded streets, and in the pathway of canals and railroads. He should talk on all these subjects, and elicit from the children their own impressions, inquiries, and reflections. He should talk and walk, and let the children talk and walk more, in the process of education, than has been the practice with the majority of instructors.

A PRACTICAL JOKE.

A gentleman of considerable talent as an orator became a member of a legislative body in one of the eastern states. In speaking, he was addicted to an odd habit of handling his spectacles; first placing them on his nose, suffering them to remain a minute or two, throwing them upon his forehead, and finally folding them up and laying them before him upon the desk. One day, a very important question came up for consideration, and he commenced a speech in opposition. A friend to the proposed measure, who was a most incorrigible wag withal, determined to spoil the effect of the honourable member's remarks, and, accordingly, before he entered the house, provided himself with a dozen pairs of spectacles. The

member commenced his speech, with his usual ability. Only a few minutes had elapsed before he was at work with his spectacles, and finally got them upon his forehead. At this juncture, our wag, who stood ready, laid another pair upon the desk before the speaker. These were taken up, and, by regular gradations, gained a place on his forehead, by the side of the others. A third, fourth, and fifth pair, was disposed of in the same manner. A smile settled upon the countenances of the honourable members, which gradually lengthened into a grin; and at last, when the speaker had warmed into one of his most patriotic and eloquent sentences, he deposited a sixth pair with the others, and there was one long and loud peal of laughter from all quarters of the hall—president, clerks, members, joined in chorus. The speaker himself looked around in astonishment at this curious interruption; but, accordingly, raising his hand, he grasped the spectacles, and the whole force of the joke rushed upon his mind. He dashed the glasses upon the floor, took up his hat, and left the hall. The bill passed by a triumphant majority, probably in consequence of the gentleman's very silly and useless habit.

VALUE OF A ROPE.

When the Killarney steamer was lately wrecked upon the coast of Ireland, with the loss of twenty-four lives, a few of the crew and passengers succeeded in getting upon a rock about two hundred yards from the shore. The humane in the vicinity flocked to the spot, and after twenty-four hours of constant exertion, succeeded in getting out a rope to the sufferers. Night closed upon their labours, however, before one of them could be got to land, and the next morning it was found that the cord had been cut and *stolen* (!) by some of the wreckers of the coast. The delay in procuring another was fatal to a poor carpenter, who died from the prolonged exposure to the elements; and it is to be hoped that the rope by which the unfortunate mariners were ultimately relieved, will be applied to an equally humane use in stringing up the wretches who could commit such a theft, perilling the lives of fourteen suffering human beings for a few bounds of cordage!

A CARD PARTY.

It is related of Madame du Deffan, that three of her friends brought a card-table to her bed-side, at her request, in her last illness, she taking a hand. As she happened to die in the midst of an interesting game, her partner played dummy for her, and thus the three quietly played it out, and settled the stakes before they called the servants to notify them of the very important demise of their mistress. Shocking as is this incident, it is trivial in comparison with one that is said to have occurred at Albany many years since. There was at that time a low-eaved, peak-roofed, stone-built inn, situated in the upper part of the city, known as the "Colonic;" a place much frequented by Schenectady teamsters and Mohawk boatmen, before the completion of Clinton's grand canal had caused that dissipated mongrel race to be superseded in their vocation. At this inn one day a man by the name of Derrick Helfenstein, but better known as "Dirk Hell of German Flats," had been seized with convulsions amid a drunken frolic, and expired during the fit, with his limbs all twisted and knotted together by the fierce muscular action incident to his disease. In Albany, at that time, the Dutch custom of several friends of the deceased remaining all night in the same room with the body, and keeping their vigil until the moment of interment, was always strictly observed; coffee, and mulled wine, with *dote*, or dead-cakes, and other refreshments, being generally provided by the nearest relatives to cheer the gloomy duty of the watchers. Dirk Hell (or Helldirk, as he was quite as often called), though a wretched vagabond, had still some whom he called friends, among the reckless and gambling crew with whom he chiefly associated; and as the landlord of the inn where he died could not well refuse the customary refreshment of liquor upon an occasion like this, three idle hangers-on of the establishment readily consented to honour the obsequies of Dirk by the usual vigil. The dead man, in the meantime, was duly laid out; but the distorted shape which his body had assumed in the death agony, made it necessary to use great force in straightening out the corpse, and recourse was had to cords to bind down his limbs to the decent form it was desirable they should assume. This disagreeable task being accomplished, the three friends of the gambler, when night came on, took possession of the apartment where he was laid out. With characteristic recklessness, they had brought a pack of cards into the chamber of death, and after taking a glass of liquor all round, and drinking the memory of their comrade with some unfeeling allusion to his sudden fate, the three profligates sat down to a game of cards upon the foot of his bed. Four hands were then dealt; that of "dummy" falling almost upon the feet of the corpse, and the other three upon the opposite sides and extreme end of the bed around which the players were thus arranged. The game proceeded apparently to the satisfaction of all parties; each of them by turns playing the hand of dummy until drinking and gambling had carried them deep into the middle watches of the night. Some slight dispute, however, now occurred as to who should play the next dummy. Words waxed high, and the two opposite players both attempted to seize upon the vacant hand at the same time, while the third, impatient at the contention, exclaimed, "I wish that Helldirk would spring up and take the cards from both of you!" The wretch had hardly uttered the wish, before the cords which bound the corpse gave way with a sharp cracking noise, the struggle about the feet having probably disarranged them—and the distorted body, released from its ligatures, bounded forward in resuming the form under which life had left it, and seated itself upon its haunches with knees drawn up to its chin, arms akimbo, and hideously distended jaws, in the midst of the appalled and disconcerted trio. The three worthies were said never to have played a game of cards afterwards.

IMITATION WINES.

It is not perhaps generally known that very large establishments exist at Cette and Marseilles in the south

of France, for the manufacture of every description of wines. Some of these establishments are on so large a scale as to give employment to an equal if not greater number of persons than our large breweries. It is no uncommon occurrence with speculators engaged in this sort of illicit traffic, to purchase and ship imitation wines, fabricated in the places named, to Madeira, where, by collusion with persons in the custom-house department of the island, the wines are landed in the entrepot, and thence, after being branded with the usual marks of the genuine Madeira vintage, reshipped principally, it is believed, for the United States. The scale of gratuity for this sort of work to the officials interested, may be estimated by the fact, that on one occasion seventy pipes were thus surreptitiously passed at a charge of one thousand dollars. It is a circumstance no less singular, that the same manoeuvre is said to be commonly carried on with counterfeit wine made up in Cette and Marseilles, and thence dispatched to Oporto, where the same process of landing, branding, and reshipment as genuine port, is gone through, the destination of this spurious article being most generally the United States. Such is the extent of this nefarious commerce, that one individual alone has been in the habit of dispatching, four times in the year, twenty-five thousand bottles of Champagne, each shipment of wines not the produce of the Champagne districts, but fabricated in these wine factories.

AN ODD KIND OF DEATH.

When Mr Kennedy, the author of "Horse Shoe Robinson," was making his eloquent speech in Congress against the sub-treasury bill, he spoke of the eccentric scruples of certain Virginia politicians in regard to a national bank. "Let Virginia," said he, "give up her dialectics, renounce her spirit of dissertation and debate, and betake herself to commerce and manufactures—let her do this, and thrive; let her neglect it, and it may be her fate" [while the orator paused, Mr Wise finished the sentence for him by saying, "to die of an abstraction."] "I adopt," said Mr Kennedy, "the gentleman's expression, though I hope a better fate awaits her, 'to die of an abstraction.'"

NEW COPYRIGHT BILL.

Edinburgh, February 27, 1839.

THE new bill for altering the law of copyright differs from the former in a few particulars. The clause for giving back assigned copyrights to the representatives of authors, at the end of the presently existing periods, is abandoned—the opposition of the publishing world having been found too strong to allow that part of the measure to pass. Mr Talfourd now proposes that the present periods shall only be extended in the case of books, the copyright of which has never been assigned away by the author—such extension to be for sixty years from the date of the author's death. The following is the clause of the bill which makes this provision:—

"Be it enacted, That in all cases in which the copyright in any book shall be subsisting at the time of passing this act, and shall be the property of the author thereof, or of the personal representative, legatee, widow, or next of kin of such author, or other person who may have acquired the same in the course of the administration of the estate of such author, or of any person to whom such author shall have assigned the same in consideration of natural love and affection, such copyright shall continue and belong to the party so entitled to the same and his assigns until the expiration of sixty years, commencing at the death of such author, subject nevertheless to any charge subsisting upon the same, and to any licence or contract granted or made relating thereto, which shall remain in force according to the true intent thereof."

Not alone, however, in cases where the author has retained the whole copyright in his own hands, does Mr Talfourd propose this extension. He provides that it shall be extended also in cases where a part has been assigned away; the holder or holders of the assignation being endowed with the same advantages as the representatives of the authors, in proportion to the amount of their share of the copyright.

The bill contains a cumbersome residue of provisions, amongst which is one to the effect, that, hereafter, in respect of books, of which the present periods of copyright have expired, and the new periods are running, it shall be lawful for any one to reprint a book which has been out of print for five years, provided he give a twelve-month's notice by advertisement of such being his intention; and the book which he thus reprints thenceforth becomes his copyright, with all the advantages conferred by the present act!

It would almost appear as if there were a predestination to absurdity awaiting all attempts to legislate on copyright. Whether there be so or not, we feel the absurdity of the present attempt so deeply, as to be scarcely able to speak of it in a serious manner. The public are well aware that almost all books are assigned by their authors to men who make a business of pushing them off, as the phrase goes, into the world. Such assignations take place by virtue of what is the nearest thing to a positive necessity—not the necessity which authors generally are under of raising as large a present sum as possible on their books, but the necessity there is for the

exertions of a tradesman, deeply interested in the speculation, to make almost any book sell or keep its place in the market. Now, it has been clearly shown, that, when a publisher buys the copyright of a book from an author, he never contemplates benefit from it for so many as even twenty-eight years, nor for the half of that time, but would give as much for a copyright which he was to have exclusively for only twelve years, as for one of three or six times the period—always providing that he was not, at the end of the period, to be deprived of the power of publishing in common with others. Certainly, there are a few cases in which popular and profitable books have been kept in the possession of the authors, and in which, of course, the bill would operate to the benefit of the posterity of these authors; but such cases are so extremely rare, as to require to be legislated for rather as an exception than as a rule: and it is, after all, very doubtful if the protection of a monopoly for twenty-eight years, or for life, be not a sufficient remuneration to the producer, and if the public have not then a claim to the free use of the book, in consideration of the very protection of that monopoly for so long a period. Amongst the very few literary productions of the last forty years, which have not been assigned away to publishers, are, we understand, the works of Messrs Southey and Wordsworth, the cause of the non-assignment in their case being the very valid one, that the works were at first unsaleable. It chances that, from a change of taste, these books have now become popular, their authors, meanwhile, having become old; so that, in the course of nature, the copyright must soon expire, unless the present legal term be protracted. It is universally rumoured that it is specially with a regard to these few peculiar cases that the present attempt has been made to alter the law of copyright—that is to say, for the sake of Mr Wordsworth, Mr Southey, and perhaps one or two other persons, whose works have been rather late in obtaining general approbation, the whole system of cheap reprinting, which has been the chief means of supplying books to the middle and poorer classes for centuries, is to be completely demolished. Was there ever such a vast amount of means required before to bring about an end so small? Could there be a more striking converse of Mr Bentham's celebrated maxim? "The smallest happiness of the smallest number" must surely be Mr Talfourd's philosophy.

Quite in accordance with this view of the principles of the learned gentleman, is his provision for cases of partial assignment. Rather than that the least fraction of a copyright that has remained with an author should be lost to those whose interests he seeks to advance, he is willing that the publishers and their heirs should have the rest. Thus, if Mr Wordsworth had retained only a tenth part of his copyrights, while Messrs A, B, C, and Company had obtained the rest, these gentlemen and their heirs and assigns are to enjoy nine times as much as the poet's children and grandchildren, and that for the same length of time. In such a case, supposing the profit from the publication to be £1000 per annum, the posterity of the booksellers realise altogether £54,000, and the posterity of William Wordsworth £6000, the books being all the time preserved as dainties for the rich, and kept effectually out of the hands of the poor—certainly a very handsome arrangement for Messrs A, B, C, and Company, who, let it be marked, did not pay one penny to the poet for this long-drawn-out benefit. The absurdity of the provision is shown in an equally striking point of view, if we suppose a bookseller thus rewarded for buying a *share* of a copyright, whereas, if he had patronised the author so heartily as to buy the *whole*, his privilege would have expired at twenty-eight years from publication, or at the death of the author—sixty years of fat monopoly being thus lost to him for his generosity.

The clause admitting of republication by any one after the work has been five years out of print, is owing, evidently, to the fears which were expressed last session as to the possible suppression of books. Of this clause we shall only say, that to men of business it must appear utterly impracticable. Not one republication would take place in consequence of it, except it were in some very peculiar case, where some considerable body of men were determinedly anxious, for moral or political reasons, to republish. We mean that no books would be republished, through favour of this clause, in the ordinary way of mercantile speculation.

We might protract these remarks, but it is surely unnecessary. The fundamental as well as superficial errors of this bill are so glaring, that, while they only can provoke derision from individuals acquainted with the business of bookselling, they must be readily appreciated by the mass of society. We trust, confidently, that the copyright bill of the next session will be one for giving exclusive satisfaction to Messrs Southey, Wordsworth, and the one or two other parties concerned, so that their interests may be reasonably protected, without, for that end, working ten thousand times greater evil than their works ever will effect good.

LONDON: Published, with permission of the proprietors, by W.S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

STORIES OF THE IRISH PEASANTRY.

BY MRS S. C. HALL.

"Mind not high things: but condescend to men of low estate."
ST PAUL.

"TIME ENOUGH."

ONE of the most amusing and acute persons I remember—and in my very early days I knew him well—was a white-headed lame old man, known in the neighbourhood of Kilbaggin by the name of BURNT EAGLE, or, as the Irish peasants called him, "Burnt Aigle." His accent proclaimed him an Irishman, but his habits were not those usually ascribed to the country, for he understood the value of money, and that which makes money—TIME. He certainly was not of the neighbourhood in which he resided, for he had no "people," no uncles, aunts, or cousins. What his real name was I never heard, but I remember him since I was a very little girl, just old enough to be placed by my nurse on the back of "Burnt Eagle's" donkey. At that time he lived in a neat pretty little cottage, about a mile from our house: it contained two rooms; they were not only clean, but well furnished, that is to say, well furnished for an Irish cottage. During the latter years of his life, these rooms were kept in order by two sisters; what relationship they bore to my old friend, I will tell at the conclusion of my tale. They, too, always called him "Burnt Aigle;" all his neighbours knew about them—and the old man would not be questioned—was, that he once left home suddenly, and, after a prolonged absence, returned, sitting as usual between the panniers on a grey pony, which was young then, and, instead of his usual merchandise, the panniers contained these two little girls, one of whom could walk, the other could not: he called them Bess and Bell; and till they were in a great degree able to take care of themselves, "Burnt Eagle" remained entirely at home, paying great attention to his young charges, and exciting a great deal of astonishment as to "how he managed to keep so comfortable and rear the children;" his neighbours had no idea what a valuable freehold the old man possessed in—his time. When Burnt Eagle first came to Kilbaggin, he came with a load of fresh heather brooms, in a little cart drawn by a donkey; but besides the brooms, he carried a store of sally switches, a good many short planks of wood, hoops large and small, bee-hives, and the tools which are used by coopers and carpenters; these were few and of the commonest kind, yet Burnt Eagle would sit on a sort of driving box, which raised him a great deal above the level of the car, into which he elevated himself by the aid of a long crutch that always rested on his knees: there he would sit; and as the donkey jogged quietly, as donkeys always do, through the wild and picturesque scenery of hill and dale, the old man's hands were busily employed either in weaving kishes or baskets, or forming noggins, or little tubs, and his voice would at times break into matches of songs, half English half Irish; for though sharp mannered, and of a sallow complexion that tells of melancholy, he was cheerful-hearted, and his voice, strong and clear, woke the echoes of the hills, though his songs were generally sad or serious.

I never heard what attached him to our particular neighbourhood, but I have since thought he chose it for its seclusion. He took a fancy to a cottage, which, seated between two sand-hills that were covered by soft green grass and moss, was well sheltered from the sea-breeze that swept along the cockle strand, and had been the habitation of Corney the crab-catcher, who, poor fellow, was overtaken by a spring tide one windy evening in March, and drowned. For a long time "Crab Hall," as it was jestingly called, was untenanted, and when Burnt Eagle fell in love with it, it was nearly in ruins. Some said Corney's ghost walked at nights over the sand-hills, but my old friend entered the dwelling, together with the donkey and a grey cat,

and certainly were never disturbed by any thing worse than their neighbours or a high storm. It did not, however, suit Burnt Eagle's ideas of propriety to suffer the donkey to inhabit any portion of his cottage dwelling; and, accordingly, after repairing his own, he built him a stable, and wove a door for it out of the sally switches. His neighbours looked upon this as a work of supererogation, and wondered what Burnt Eagle could be thinking of to go on slaving himself for nothing. What would all a lone man to live in our town!—wasn't that enough for him! It would be "time enough" to be building a house when he had some one to live in it. But he went on his own way, replying to their remonstrances with a low chuckling laugh, and darting one glance of his keen piercing eyes upon them, in return for the stare of lazy astonishment with which they regarded his proceedings.

Burnt Eagle was, as I have said, an admirable economist of time; when he took his little car about the neighbourhood with brooms, or noggins, or baskets, or cockles, or any thing else, in fact, that might be wanted, he never brought it home empty; when he had disposed of all his small merchandise, he would fill it with manure or straw, which the gentry or farmers gave him, or that he gathered on the roads. If he could bring nothing else, he would bring earth or weeds; suffering the latter to decay, preparatory to the formation of a garden, with which he proposed to beautify his dwelling; the neighbours said it would be "time enough" to think of getting the enrichment for the ground when the place was laid out for it. But Burnt Eagle would not be stayed in his progress by want of materials. So, not until he had every thing ready, even a sty built for the pig, and a fence placed round the sty to prevent the pig from destroying his bit of land when it was made and cropped: not until then did he commence; and though the neighbours again said "it would be 'time enough' to deprive the pig, the craythur, of his liberty whin the garden was to the fore," Burnt Eagle went on his own way, and then every one in the parish was astonished at what he had accomplished.

The little patch of ground this industrious old man had, after incredible labour, succeeded in forming over the coat of sward that covered the sand, was in front of Crab Hall. The donkey had done his best to assist a master who had never given him an unjust blow; the fence was formed, round the little enclosure, of grey granite, which some convulsion of nature had strewn abundantly on the strand; these stones the donkey drew up when his day's work was ended, three or four at a time. Even this enclosure was perfected, and a very neat gate of basket-work, with a latch outside and a bolt in, hung opposite the cottage door before Burnt Eagle had laid down either the earth or manure on his plot of ground.

"Why, thin, Burnt Aigle dear," said Mrs Radford, the net-maker's wife, as, followed by seven lazy dirty healthy children, she strolled over the sand-hills one evening to see what the poor *bocker** was doing at the place, "that was good enough for Corney the crab-catcher without alteration, dacent man! for twenty years."—"Why, thin, Burnt Aigle dear, what are ye slaving and fencing at?"

"Why, I thought I could ye, Mrs Radford, whin I taught ye the tight stitch for a shrimp-net, that I meant to make a garden here; I understand flowers, and the gentry's ready to buy them; and, sure, when once the flowers are set, they'll grow of themselves, while I'm doing something else. Isn't it a beautiful thing to think of that!—how the Lord helps us to a great deal, if we only do a *little* towards it!"

"How do you make that out?" inquired the net-maker.

Burnt Eagle pulled a seed-pod from a tuft of beautiful sea-pink. "All that's wanted of us," he said, "is

to put such as this in the earth at first, and doesn't God's goodness do all the rest?"

"But it would be 'time enough,' sure, to make the fence whin the ground was ready," said his neighbours, reverting to the first part of her conversation.

"And have all the neighbours' pigs right through it the next morning?" retorted the old man, laughing; "no, no, that's not *my* way, Mrs Radford."

"Fair and aisy goes far in a day, Masther Aigle," said the gossip, lounging against the fence, and taking her pipe out of her pocket.

"Do you want a coal for your pipe, ma'am?" inquired Burnt Eagle.

"No, I thank ye kindly; it's not out, I see," she replied, stirring it up with a bit of stick previous to commencing the smoking with which she solaced her laziness.

"That's a bad plan," observed our friend, who continued his labour as diligently as if the sun was rising instead of setting.

"What is, Aigle dear?"

"Keeping the pipe a-light in yer pocket, ma'am; it might chance to burn ye, and it's sure to waste the tobacco."

"Augh!" exclaimed the wife, "what long heads some people have! God grant we may never want the bit o' tobacco! Sure it would be hard if we did; we're bad enough off without that."

"But if ye *did*, you know, ma'am, ye'd be sorry ye wasted it, wouldn't ye?"

"Och, Aigle dear, the poverty is bad enough whin it comes, not to be looking out for it."

"If you expected an inimy to come and burn yer house" ("Lord defend us!" ejaculated the woman), "what would you do?"

"Is it what would I do? bedad, that's a quare question. I'd pervent him, to be sure."

"And *that's* what I want to do with the poverty," he answered, sticking his spade firmly in the earth; and, leaning on it with folded arms, he rested for a moment on his perfect limb, and looked earnestly in her face. "Ye see every one on the *sod*—green though it is, God bless it—is somehow or other born to some sort of poverty. Now, the thing is to go past it, or undermine it, or get rid of it, or prevent it."

"Ah, thin, how?" said Mrs Radford.

"By forethought, prudence; never to let a farthing's worth go to waste, or spend a penny if ye can do with a halfpenny. Time makes the most of us—we ought to make the most of him; so I'll go on with my work, ma'am, if you please; I *can* work and talk at the same time."

Mrs Radford looked a little affronted, but she thought better of it, and repeated her favourite maxim, "Fair and aisy goes far in a day."

"So it does, ma'am; nothing like it; it's wonderful what a dale can be got on with by it, keeping on, on, and on, always at something. When I'm tired at the baskets, I take a turn at the tubs; and when I'm wearied with them, I tie up the heath—and sweet it is, sure enough; it makes one envy the bees to smell the heather! And when I've had enough of that, I get on with the garden, or knock bits of furniture out of the timber the sea drifts up after those terrible storms."

"We burn that," said Mrs Radford.

"There's plenty of turf and furze to be had for the cutting; it's a sin, where there's so much furniture wanting, to burn any timber—barring chips," replied Eagle.

"Bedad, I don't know what ill luck sea timber might bring," said the woman.

"Augh! augh! the worst luck that ever came into a house is idleness, except, maybe, extravagance."

"Well, thin, Aigle dear!" exclaimed Mrs Radford, "what's come to ye, to talk of extravagance!—what in the world have poor craythurs like us to be extravagant with?"

* A lame man.

"Yer time," replied Burnt Eagle, with particular emphasis; "yer time."

"Ah, thin, man, sure it's 'time enough' for us to be thinking of that whin we can get any thing for it."

"Make any thing of it, ye mean, ma'am; the only work it'll ever do of itself, if it's let alone, will be destruction."

"Well!" exclaimed Mrs Radford, indignantly, "it's a purty pass we're come to, if what we do in our own place is to be comed over by a stranger who has no call to the country. I'd like to know who you are, upsetting the ways of the place, and making something out of nothing like a fairy man! If my husband did go to the whisky shop, I'll pay him off for it myself; it's no business of yours, and maybe we'll be as well off in the long-run as them that are so mean and thoughtful, and turning their hand to every man's trade, and making gentlemen's houses out of mud cabins, and fine gardens in the sand-hills, doing what nobody ever did before! It won't have a blessing, mark my words! Ye're an unfriendly man, so ye are. After my wearing out my bones, and bringing the children to see ye, never to notice them, or ask a poor woman to sit down, or offer her a bit of tobacco, when it's rolls upon rolls of it ye might have *antagonist*, without duty, if ye liked, and ye here on the sea-coast."

"I have nothing that doesn't pay duty," replied Burnt Eagle, smiling at her bitterness. "I don't go to deny that the excise is *hard* upon a man, but I can get my bit of bread without breaking the law, and I'd rather have no call to what I don't rightly understand. I'm sure ye're heartily welcome to any thing I have to give. I offered to make a gate for yer sty, to keep yer pig out of the cabbagees, and I'm sure!"

Again Mrs Radford, who was none of the gentlest, interrupted him.

"We are ould residents in the place, and don't want any of yer improvements, Misher Burnt Aigle, thank you, sir," she said, drawing herself up with great dignity, thrusting her pipe into her pocket, and summoning her stray flock, some of whom had entered Crab Hall without any ceremony, while others wandered at their "own sweet will" in places of dirt and danger—"I daresay we shall get on very well without improvement. We're not for setting ourselves above our neighbours; we're not giving up every bit of innocent diversion for slavery, and thin having no one to lave for what we make—no chick nor child!"

"Woman!" exclaimed Burnt Eagle, fiercely, and he shook his crutch at the virago, while, astonished at the generally placid man's change, she drew back in terror, "go home to yer own piggery, follow yer own plan, waste the time the Almighty gives to the poorest in the land, gossip and complain, and make mischief; what advice and help I had to give, I gave to ye and to others ever since I came in the place; follow yer own way, but lave me to follow mine—time will tell who's right and who's wrong."

"Well, I'm sure!" said Mrs Radford, quailing beneath his bright and flashing eye, "to think of that now! how he turns on us, like a wild baste, out of his sand-hole, and we in all friendship! Well, to be sure—sure there was 'time enough'!"

"Mammy, mammy!" shouted one of the seven "hopes" of the Radford family, "ye're smoking behind, ye're smoking behind!"

"Oh, the marcy of heaven about me!" she exclaimed; "Burnt Aigle's a witch; it's he has set fire to me with a wink of his eye, to make his words good about the coal and the pipe in my pocket. Oh, thin, to see how I'm murdered entirely through the likes of him! I've carried a live coal in my pocket many's the day, and it never earned me so before! Oh, it's true, I'm afeared, what's said of ye, that ye gave the use of one of yer legs to the devil—mother of marcy protect me!—to the devil for knowledge and luck; and me that always denied it to be served so. Don't come near me—I'll put it out myself; oh, to think of the beautiful gown, brae new it was last Christmas was a year! Am I out now, children dear! Oh, it's yer mother's made a show before the country to please him! What would come over the coal to do me such a turn as that now, and never to think of it afore! Oh, *sovereign* was in me to come near yer improvements!"

"Mammy," interrupted the eldest boy, "don't be hard upon Burnt Aigle: there's the coal that dropt out of the pipe, red hot still—see, here where ye stood—and the priest tould ye the danger of it long ago."

"Oh, sure it's not going to put the holy man's advice ye are on a level with Burnt Aigle's! Come, we'll be off. I meant to take off my beautiful gown before I came out, but thought it would be 'time enough' whin I'd go back. And to see what a *bocher* has brought ye to, Judith Radford!" And away she went, fuming and fretting over the sand-hills, stopping every moment to look back at the devastation which her own carelessness had occasioned her solitary dress. Burnt Eagle imagined he was alone, and kept his eyes fixed upon the foolish woman as she departed, but his attention was arrested by Mrs Radford's second daughter, who stole round the lame man, and touched his hard hand with her little fingers.

"Ye're not a witch, are ye, daddy?" she said, while looking up smilingly, but with an expression of awe in his face.

"No, darlint."

"'Twas the coal done it—wasn't it?"

"It was."

"Well, good night, Burnt Aigle; kiss little Ailey—there. Mother will forget it all, or have it all out—the

same thing you know. I haven't forgot the purty noggin you gave me; only it hurts mother to see how you got on with a little, and father blames her, and gets tipsy; so just go on yer own way, and don't heed us. Mother wants that the sun should shine only on one side of the blackberries; but I'll larn of ye, daddy Aigle, if ye'll tache me; only don't bother the mother with what she has no heart to, and sets the back of her hand against." And, after asking for another kiss, the little barefooted pretty girl—whose heart was warm, and would have been a credit to any country if she had been well married—darted over the banks like a fawn, her small lissom figure graceful as a Greek statue, her matted yellow hair streaming behind her, and her voice raised to the tune of "Peggy Bawn."

"It's truth she says—God's truth, any way," said Burnt Eagle, as he turned to enter his cottage. "It's truth; they set the back of their hand and the back of their mind against improvement; they'd be ready to tear my eyes out, if I tould them what keeps them back. Why, their own dislike to improvement, part; and the carelessness of their landlords, part; the want of sufficient employment, a great part; and, above all, their being satisfied with what they get, and not trying to get better. As long as they're content with the salt and potato, they try for nothing else: set John Bull down to salt and potato, and see how he'll look; and why shouldn't you get as good, Paddy agh! But no, you won't; a little more method, a little more capital employed amongst you, and plenty of steadiness, would make you equal to any thing the world produced since it was a world. But no: ye keep on at yer ould ways, and yer ould sayings, and all things ould, and ye let others that haven't the quarter of yer brains get the start of ye. Yet where, Paddy, upon the face of the earth, is a finer man or a brighter head nor your own?" The old man shut his door, and lit his lamp, which was made of a large scallop shell, the wick floating in oil he had extracted from the blubber of a grampus that otherwise would have decayed unnoticed on the shore.

I have told all I heard as to Burnt Eagle's first settlement in what I still call "my neighbourhood." I will now tell what I know, and what occurred some time after. I very well remember being taken by my mother, who was a sort of domestic doctor to the poor, to see Judy Radford, who, plunged into the depths of Irish misery, was mourning the loss of her husband, drowned because of the practice of the principle that it was "time enough" to mend the boat; "it had taken the boys often, and why not now?" But the boat went down, and the poor, overworked, good-natured father and his eldest son were lost! We could hardly get to the door for the slough and abominations that surrounded it. "Judy," said my mother, "if this was collected and put at the back of the house, you need not have come begging to the steward for measure."

"Och, ma'am, won't it be 'time enough' to gather it when we have the seed potatoes!—sure it was *always* there, and the young ducks would be lost without it."

"Such a quantity of impurity must be unhealthy."

"We has the health finely, thank God! if we had every thing else;" and then followed a string of petitions, and lamentations, and complaints of her neighbours, all uttered with the whine of discontent which those who *deserve* poverty indulge in, while those who are struggling against it seek to conceal, from a spirit of decency, the extent of their wants. "Indeed, ma'am," she continued, "the ill luck is after us; my second boy has, as all the country knows, the best of characters, and would have got the half acre at the Well corner, if he had gone to his honour in time for it, and that would have been the help to us, sure enough; but we thought there was 'time enough,' and Bill Deasy, who's put up to all sort of sharpness by Burnt Aigle, got the promise."

"Well, did Ailey get the flax wheel I told her she could have from Lucy Green until she was able to buy one?"

"Oh, ma'am, there it is again; I kept her at home just that *one* day on account of a hurt I got in my thumb, and thought it would be 'time enough' to be troubling your honour for a plaster if it got worse—which it did, praise be to God!—and never did a hand's turn with it since; and whin she went after it, Miss Lucy had lent it, and was stiffer about it than was needful. My girl tould her she thought *she'd* be 'time enough,' and she hurt her feelings, saying, 'she thought we'd had enough of 'time enough' among us before.' It was very sharp of her; people can't help their troubles, though that ould thriving *bocher* that's made all he has out of the gentry, never scruples to tell me that I brought them on myself."

"I must say a word for Burnt Eagle," said my mother; "he has made all he has out of himself, not out of the gentry; all we did was to buy what we wanted from him—one of his principles being, never to take a penny he did not earn."

"And very impudent of him to say that, whin the gentry was so kind as to offer him money—setting himself up to do without help!" said Mrs Radford, whom we were fain to leave in the midst of her querulous complainings.

We now proceeded along the cliffs to the *bocher's* dwelling: to visit him was always a treat to me; but childhood's ready tears were excited by the detail of his sorrow for his companion and friend, for such the poor donkey had been to him.

The struggle which took place between his habit of making the best and most of every thing, was in this

particular instance at war with the affection he had borne his dead favourite; he knew her skin was valuable, and he did not see why he ought not to use it; one of our friends had called accidentally at the cottage, and found Burnt Eagle standing beside a deep pit he had excavated in the sand-hill, intended for the donkey's grave; he had a knife in his hand, and had attempted the first incision in its skin.

"It can't be any hurt to a dead animal, sir," he said, "and yet I can't do it! It seems like taring off my own flesh: the poor baste had such a knowledge of me—such a feeling for me—up hill and down dale—it knew all my poverty, and was through the world with me, in trouble that was harder to bear than poverty—and if ever I struck it a hasty blow, it would look in my face like a Christian. It was neither giddy, nor greedy, nor wilful, though it was a she; and the low whining it would give me of a morning, was like the voice of a dear friend. I knew the skin would be useful, and the times are hard; but I can't, sir, I can't; it would be like skinning a blood relation," and he threw the knife from him—the finest sea-pinks of the banks grew on the donkey's grave! We found our humble friend surrounded by business, and indeed we jested with Mrs Radford's daughter Ailey, who met us at the gate, for visiting her old sweetheart. The yellow-headed child had grown into a fine young woman; the old man's precept and example had been of use to her; whatever she had learnt of good, she had learnt from him. She had been tying up some flowers for her friend, and hastened to tell us that Burnt Eagle had been making her a flax wheel, and she was to knit out the money for it in stockings; but her mother knew nothing of it, and we mustn't tell. I was lifted, for the first time, on the grey pony, and galloped it, to Burnt Eagle's delight, over a sand-hill. There was something to love and respect in the old man's countenance; I remember him so well that day, leaning on the top of his staff at the gate of his little garden, which had become celebrated for beautiful flowers; there he stood—I can close my eyes and see him now—his small figure bent over his stick; his thick, long, grey hair curling on the white collar of his shirt; his eyes rendered more brilliant by the healthy complexion that glowed upon his cheeks; his jacket of grey frieze girded with a leathern belt that was garished by such tools as he was constantly requiring; the outline of his form, thrown forward by the clear sky; the roll of the distant waves, the scream of the sea-gull; the cottage, so picturesque; its white smoke curling up, up, up, till it mingled with the air; I can hear the warning voice of my dear mother, entreating me not to canter; the admonishing yet pleased tone in which the old man spoke to his new purchase; the sleepy look of his dog Blarney, as he half wagged his tail and opened one eye to observe what passed;—in the distance, the old ruined church of Kilbaggin, standing so bravely against sea and land storms; my own heart echoing the music of the peary's feet, as, despite all warning, he cantered right merrily over the sward; happy, happy was I then as any crowned queen!—how fresh the breeze!—how clear the air!—faster, good pony, don't lag on my account—well done!—there's mettle in you, that there is! Oh, memory!—I open my eyes. It was indeed but memory, for here is my desk, and there my books and town-bred flowers, and my pretty quiet greyhound—and the sea, the ruins, the cottage, those lofty hills and toppling cliffs, are now far, far from me, yet near my heart as ever. And poor Burnt Eagle!—But I must not anticipate, and will only say, that, if we endeavour to improve our generation with as much zeal and sincerity as that old man did, we shall owe Time nothing.

I have seen lately in Ireland as well-built and as well-kept cottages as over I saw in England; they are not universal—would to God they were!—yet I have seen them, and in my own county too, where, I trust, they will increase. But when I was a very little girl, they were not so general, and Burnt Eagle's was visited as a curiosity; the old man was so neat and particular; the windows—there were two—looked out, one on his little garden, the other commanded the vista that opened between the sand-hills; and when the tide was in, the oockle strand presented a sheet of silver water; the rafters of the kitchen were hung with kishies and baskets, lobster-pots, bird-cages, strings of noggins, bunches of skewers, little stools, all his own workmanship; and the cabbage and shrimp nets seemed beyond number; then brooms were piled in a corner, and the handles of spades and rude articles of husbandry were ready for use; there was a grinding-stone, and some attempt at a lathe; and the dresser, upon which were placed a few articles of earthenware, was white and clean; a cat, whom Burnt Eagle had not only removed, but, in defiance of an old Irish superstition, carried over water, was seated on the hearthstone, and the old man amused us with many anecdotes of her sagacity. One beautiful trait in his character was, that he never spoke ill of any one; he had his own ideas, his own opinions, his own rules of right, but he never indulged in gossip or backbiting. "As to his never doing," he said, when complimented on the superior appearance of his own cottage, "the hand of the Lord has been heavy on her to point out the folly of her ways, and that ought to tache her: those who cast the grace of God from them are very much to be pitied; for if it's a grace to the rich, it is surely a grace to the poor. But the people are greatly improved, madam, even in my time; the Agricultural Societies do good, and the Loan Societies do good, and there's a dale of good done up and down

through the country, particularly here, where the landlords—God bless them—stick to the sod; and the cottages are whitewashed, and ye can walk dry and clane into many of the doors; and some that used to turn me into ridicule, come to me for advice; and I'm welcome to high and low, not looked on, as when I came first, with suspicion; indeed, there are not many now like poor Mrs Radford: but Ailey will do well, poor girl—she always took to dacency."

"You certainly worked wonders, both for yourself and others; I think you might do me a great deal of good, Burnt Eagle, by telling me how you managed," said my mother.

"Thank you, my lady, for the compliment; but, indeed, the principal rule I had was, 'NEVER TO THINK IT WAS TIME ENOUGH TO DO ANY THING THAT WANTED DOING.' I've a great respect for time, madam; it's a wonderful thing to say it was before the world, and yet every day of our lives is both new and old—old in its grateness, yet new to thousands; it's God's natural riches to the world; it never has done with us, till it turns us over to Eternity; it's the only true teacher of wisdom—it's the Interpreter of all things—it's the miracle of life—it's flying in God's face to ill use it, or abuse it; it's too precious to waste, too dear to buy; it can make a poor man rich, and a rich one richer! Oh, my lady, time is a fine thing, and I hope little miss will think so too; do, dear, remember poor Burnt Eagle's words, never to think it 'TIME ENOUGH TO DO ANY THING THAT IT'S TIME TO DO.'"

"I wish," said my mother, "that you had a child to whom to teach so valuable a precept." The old man's lips (they were always colourless) grew whiter, and he grasped the top of his crutch more firmly; his eyes were rivetted as by a spell; they looked on nothing, yet remained fixed; his mouth twitched, as by a sudden bitter pain; and by degrees tears swam round his eyelids. I could not help gazing on him, and yet, child though I was, I felt that his emotion was sacred; that he should be alone; and though I continued to gaze, I moved towards the door, awe struck, stepping back, yet looking still.

"Stay, stay, miss," he muttered. "Sit down; you are not well," said my mother. "Look at that child," he continued, without heeding her observation; "she is your only one, the only darlint ye have; pray to the Lord this night, lady, this very night, on yer bended knees, to strike her with death by the morning, before she should be to you what mine has been to me." He staggered into his bedroom without saying another word. My mother laid upon the table a parcel containing some biscuits I had brought him, and we left the cottage, I clinging closely to her side, and she regretting she had touched a string which jarred so painfully. I remember I wept bitterly: I had been so happy with the pony, which I fancied worth all the horses at our house; and the revulsion was so sudden, that my little heart ached with sorrow; I wanted to know if Burnt Eagle's daughter had been "very naughty," but my mother had never heard of his daughter before.

What I have now to tell has little to do with the character of my story, and yet is remarkable as one of the romances of real life, which distance all the efforts of invention, and was well calculated to make an impression on a youthful mind. The next morning, soon after breakfast, my cousin came to my mother to inquire if she knew any thing of the destruction of a provincial paper, the half of which he held in his hand. "I wanted it," he said, "to see the termination of the trial of that desperate villain Ralph Blundel at the Cork assizes." "I think I wrapt it round those biscuits Maria took to Burnt Eagle," said mamma, "but I can tell you the termination of the tragedy. Blundel is hanged by this time; but the sad part of the story is, that a young woman, who is supposed to have been his wife, visited him in prison, accompanied by two children; he would not speak to her, and the miserable creature flung herself into the river the same night."

"And the two children?"

"They were both girls, one a mere baby; there was nothing more said about them."

Tales of sorrow seldom make a lasting impression even on the most sensitive, unless they know something of the parties. We thought little and talked less of Ralph Blundel; but we were much astonished to hear the next morning that Burnt Eagle had set off without any thing in his creels. This was in itself remarkable; and it was added, that he appeared almost in a state of distraction, yet gave his cottage and all things contained therein in charge to his friend Ailey. Time passed on, and no tidings arrived of the old man, though we were all anxious about him. Some said one thing, some another. Mrs Radford hinted, "the good people had got him at last," and began to speculate on the chance of his never returning, in which case she hoped Ailey would keep Crab Hall. He had been absent nearly six weeks, but was not forgotten, at all events by me. I was playing one summer evening at the end of the avenue with our great dog, when I saw Burnt Eagle jogging along on his pony. The animal seemed very weary. I ran to him with childish glee, forgetting our last interview in the joy of the present. I thought he looked very old and very sad, but I was delighted to see him, notwithstanding. "Oh, Burnt Eagle," I exclaimed, "Grey Fan staved in Peggy's best milk pail, and eek wants some new cabbage-nets; and I've got two young magpies, and want a cage; and grandmamma wants a netting pin; and—but what have you got in your panniers?" and I stood on tiptoe to peep

in; but instead of nets, or noggins, or cockles, or wooden ware, there was a pretty rosy child as fast asleep in the sweet hay as if she had been pillowed on down.

I was just going to say, "Is that your little girl?" but I remembered our last meeting.

"That's little Bell, miss," he said, and his voice was low and mournful. "Now, look in the other, and you will see little Bess," and his smile was as sad as any other person's tears would have been.

I did look, and there was another! How astonished I was!—I did not know what to say. That child was awake—wide awake—looking up at my face with eyes as bright, as blue, as deep, as Burnt Eagle's own. He wished me good-bye, and jogged on. I watched him a long way, and then returned full of all the importance which the first knowledge of a singular event bestows. The circumstance created a great sensation in the country. The gentry came from far to visit Burnt Eagle's cottage. Civil he always was, but nothing could be extracted from him relative to the history of his little protégés; the priest knew, of course, but that availed nothing to the curious; and at last, even in our quiet nook, where an event was worn threadbare before it was done with, the excitement passed away, and my mother and myself were the only two who remembered the coincidence of the old man's emotion, the torn newspaper, and Burnt Eagle's sudden disappearance.

Bess and Bell grew in beauty and in favour with the country. They were called by various names—"Bess and Bell of Crab Hall," or "Bess and Bell Burnt Eagle," or "Bess and Bell of the Sand-hills."

For a long time after the old man's return, he was more retired than he had been. He was melancholy, too, at times, and his prime favourite Ailey declared "there was no pleasing him." By degrees, however, that moroseness softened down into his old gentle and kindly habits. He would not accept gifts of money or food from any of us, thanking us, but declining such favours firmly. "I can work for the girls as still," he would say; "and by the time I can't, please God they'll be able to work for themselves; there's many wants help worse than me." It was a beautiful example to the country to see how those children were brought up; they would net, and spin, and weave baskets, and peel osiers, and sing like larks, and weed flowers, and tie up nosebags, and milk the goats, and gather shell-fish, and knit gloves and stockings, emulating the very bees (of which their protector had grown a large proprietor) in industry; and in the evenings the old man would teach them to read, and the nearest schoolmaster would come in and set them a copy, for which Burnt Eagle, scrupulously exact, would pay night by night, although the teacher always said "it would be 'time enough' another time;" and the old man would reply, while taking the pence out of his stocking-purse, "that there was no time like the present; and that if folks could not pay a halfpenny to-day, they would not be likely to be able to pay a penny to-morrow." The neighbours laughed at his oddity. But prosperity excites curiosity and imitation; and his simple road to distinction was frequently traversed. Solitary as were his habits, his advice and humble assistance were frequently asked, and always given. When first we left our old home, we went to bid him farewell. He was full of a project for establishing a fishery, and said, "Some one had told him that the Irish seas were as productive as the Irish soil, where there was a new harvest every season, free of rent, tithe, or taxes, and needing only boats, nets, and hardy hands, to reap the ocean-crop which Providence had sown. I've spoke to the gentry about it," he said, "but they say 'they'll see about it,' and it'll be 'time enough.' If my grave could overlook a little set of boats," he added, "going out from our own place, I'd rest as comfortable in it as on a bed of down; but if they stick to 'time enough,' the time will never come!"

"Burnt Eagle," said Bell, who was growing a very tall girl—girls do grow so fast!—"you said 'time enough' to Bess yerself yesterday."

"When, avourneen?"

"When she asked you when she might begin to think about—about—oh, you know what."

"I can't think of any thing but the fishery—what was it, a chora?"

"Oh, thin, it was a sweetheart," said the merry maid, covering her blushing face with her hands, and running away.

"See that now, how they turn on me!" he exclaimed, while his eyes followed her. "Well, Miss Bell, maybe I won't be even with you 'time enough.' God bless her, the gay light-hearted girl!—the life is in her heart and the joy in her eye!—only she's too like them that's gone! But, sure, out of the deep pit of trouble rode up the joy and pace to me in the end, though, at first, it drove me for ever from my own people, and I've done my best for her that's gone; and poor Ailey is married to a decent boy, and will do well. An empty heart's a lonely thing in a man's bosom—but the country and the girls has filled mine—God be praised for his goodness! I knew ye mistrusted how it was—on account—but it's all over, my lady; and for a poor old sinner like me, I've had a dale of happiness! I never ill-treated Time, and he has never ill-treated me. Maybe I'll never see either of you again; but, oh, miss dear, don't forget yer country, and don't think there'll be 'time enough' to do it a good turn, but do it at once—do—and God bless you! It's to manage time rightly—that's a fine knowledge—it's a grate knowledge, and would make a poor man's fortune, and tache a rich one

to keep it. You'll do a good turn for the country, and think always there's no time like the present!"

I saw the old man no more, but the last time I visited Kihlaggin, I stood by his grave. It was a fine moonlight evening in July; and Bess and Bell, the former being not only a wife, but a mother, had come to show me his last resting-place: they had profited well by his example, and Bess made her little boy kneel upon the green-sward that covered his remains. "He died beloved and respected by rich and poor," said Bell (Bess could not speak for weeping), "and had as grand a funeral as if he was a born gentleman, and the priest and minister both at it; and the Killbarries and Mulvanays met it without wheeling one shillah, and they sworn foes, only out of regard to his memory for the fine example he set the country, and the love he bore it."

The old ruined church of Kihlaggin overlooks the entrance to its pretty silver-sanded bay, and the voices of the fishermen, who were at that time putting out to sea, availing themselves of the beauty and stillness of the night, arose to where we stood. I shall never forget the feelings that crowded on me; the ocean was so calm, the moonlight so bright: the picture of the good old man who lay beneath, where the innocent baby was still kneeling, came before me; I remembered the useful and virtuous tenor of his life, the heroism with which he withstood envy, and persevered in the right way; the white sails of the fishing-boats glimmered in the moonlight; it was Burnt Eagle who had stirred up the hearts of the people to the enterprise, which now brought plenty from the teeming ocean to many a cottage home.

"I mind, when you war going to England first," said Bell, "his saying, that if his grave could overlook a little fleet of boats going out from our own bay, he'd be happy as on down! Sure he may be happy now!—his good thoughts, and quiet good actions, blossom over his grave. I remember how delighted he was with the first regular boat that went; it was built by Bess's husband. What a happy man he was, to be sure! and how he sat on the cliff, shading his eyes with his hand from the sun, though he had lost sight of the sail long before; and then he knelt down, and raised his old hands to heaven, and blessed us both."

"That's enough," said Bess; "sure the lady knew the good that was in the old pathriol, who asked her—if ever she could—never to think it 'time enough' to do a good turn for the country, but to believe there's no time like the present for doing that and every thing else."

MACLAREN ON THE NATURAL HISTORY OF COAL.

A "SKETCH of the Geology of Fife and the Lothians, including Detailed Descriptions of Arthur's Seat and the Pentland Hills, by Charles Maclaren, Esq., F.R.S.E.," is the title of a volume recently published.* The district referred to is very interesting in a geological point of view, not only as containing a considerable variety of rocks, sedimentary and igneous, but as exposing specimens of most of those above the ground, in a very liberal manner, so as to give the place peculiar advantages as a practical school for the geological student. To those who have visited Edinburgh, and seen the precipitous hills among and upon which it is situated, the edges of strata exposed on the neighbouring coasts, the numerous mines in the coal field of the Esk, and the quarries which have been opened for building purposes in the adjacent sand and limestones, we need say no more on this point. The description of this district has fallen into good hands. Mr Maclaren is well known to British and also foreign geologists, as an industrious student of rocks, and an enlightened and cautious theoriser. He has expended a wonderful amount of labour on the volume, more, by many degrees, than it is the fashion now-a-days to expend on any kind of books: we have heard that the task has been the sole occupation of his leisure time for several years. But the result has been the production of a work which exhausts the subject as far as existing circumstances will allow, and which is not only complete as a description of the field it professes to refer to, but throws considerable light on the science in general. Its value is greatly enhanced by the numerous wood-cuts and other engravings by which it is illustrated.

We present the following account of the nature and origin of coal, not as a characteristic specimen of the book, or as containing any new views by Mr Maclaren, but as one of the passages most likely to be generally understood:—

"It is now universally allowed that coal is the product of decomposed vegetable matter; and there are two hypotheses as to the mode in which it was brought together in such vast quantities. Deluc, Brongniart,

* Edinburgh, Adam and Charles Black, 1860.

Dr Macculloch, and Mr Hutton of Newcastle, think that the plants generally grew and died on the spot where the coal exists, and that a bed of coal was analogous in its origin to a peat-bog. The other hypothesis (which is perhaps more generally received) assumes that the vegetable matter was swept from the land into estuaries or lakes by inundations and streams, as the trunks and branches of trees, with plants and foliage, are carried down by the Mississippi and St Lawrence in North America. The difficulty of accounting for the immense accumulations of vegetable matter spread over such extensive areas, is great in either way. But without going into the comparative merits of the two hypotheses, the former is assumed as true, for the purpose of illustration, in the following remarks.

Coal was analogous in its origin to modern peat, and each bed was most probably formed on an extended surface of marshy land, covered with a rank vegetation. The finest caking coal Mr Hutton considers as a crystalline compound, whose constituents had been in a state of solution; but slate coal and cannel coal often bear distinct impressions of plants. The new method of cutting minerals into slices so thin as to be transparent, of which Mr Witham has made so happy a use, has been applied to coal; and by examining these with the microscope, the vegetable structure has been detected where no external trace of it was visible. In cannel coal it exists throughout the whole mass, while the fine coal retains it only in small patches, which appear as if it were mechanically entangled. Among other indications of the ligneous origin, tubes have been discovered filled with a yellowish resinous matter, which is the most volatile part of the coal, being what is first driven off by heat. All coal, therefore, had originally existed in the state of plants or trees. About three hundred species have been found in the sandstone and shale of the coal measures; and the greater part of these probably exist in the coal itself, though the tenderness and opaqueness of the material render it difficult to detect them by examination. The three hundred species are all extinct. About two-thirds of them are ferns; the others consist of large Conifere (allied to the pine), of gigantic Lycopodiaceae, of species analogous to the Cactee and Euphorbiaceae, and of palms. The plants indicate a moist climate, as hot as that of the tropics; and this holds true in the coal plants, not only in England, but at Melville Island within the polar circle. Dr Hutton thought that the vegetables had been carbonised by heat; but Dr Macculloch contends, on good grounds, that the change has been effected solely by water and pressure, and that by these agents peat is capable of conversion into coal.

In the coal, therefore, familiarly used in our houses, we have the forests of primeval times, deprived of their watery and volatile parts, but preserving all their combustible matter, laid up for our use, as it were, in vast cellars under our feet, closely packed, and protected from air, rain, and floods, by a solid covering of rock and soil. Few of those who are in the daily enjoyment of the comforts and advantages derived from abundant supplies of this fuel, think of the long and operose processes by which it was prepared in the laboratory of nature. A short calculation will explain what is here meant. Wood affords in general about 20 per cent., and coal about 80 per cent. of charcoal. Neglecting the oxygen and hydrogen, therefore, it must have required four tons of wood to yield the charcoal which we find in one ton of coal. Let us then suppose a forest composed of trees 80 feet high, that the trunk of each tree contains 80 cubic feet, and the branches 40, making 120; the weight of such a tree, at 700 specific gravity, will be 2½ tons; and allowing 130 trees to an acre, we have 300 tons on that space. Supposing the portion that falls annually, leaves and wood, to be equal to one-thirtieth, we have 10 tons of wood annually from an acre, which yields 2 tons of charcoal; and this charcoal, with the addition of bitumen, forms 2½ tons of coal. Now, a cubic yard of coal weighs almost exactly one ton; and a bed of coal one acre in extent, and three feet thick, will contain 4840 tons. It follows, therefore, that one acre of coal is equal to the produce of 1940 acres (that is, 4840 divided by two and a half) of forest; or if the wood all grew on the spot where it remains exist, the coal bed three feet thick, and one acre in extent, must be the growth of 1940 years! Even if we suppose the vegetation, as that of a tropical climate, to be twice as rapid as I have assumed, we shall still require about a 1000 years to form a bed of coal one yard thick; and for the 36 yards of coal in the Mid-Lothian field a period of 36,000 years! When we reflect further that the coal constitutes only one-thirtieth part of the entire series of beds comprehended in the group, some of which were probably formed by as slow a process, we shall have no reason to reject Dr Macculloch's estimate of 600,000 years as too long for the production of the whole mass.

An attempt to explain the formation of the coal strata leads us to infer many changes of level in the land or water, and is attended with considerable difficulties. The sandstone, shale, and limestone, must all have been formed under water, and the coal on land, perhaps in a marsh. In the section of the Mid-Lothian field, for instance, the coral limestone at the bottom must have been formed in the sea. We may then suppose the bottom to have been raised by the deposition of four fathoms of sandstone and shale, formed of detritus, swept down from the neighbouring land, till the gulf or bay shoaled into a tract of marshy

ground. Upon this forests grew for a thousand years, the spoils of which accumulated where they fell, and formed a thick stratum of vegetable matter. The land must then have sunk suddenly or gradually under water to a great depth, and remained there perhaps for ten thousand years, till a fresh deposit of sandstone and shale, to the depth of nineteen and a half fathoms, took place, the pressure of which, aided by water, converted the stratum of wood into coal, No. 1. By this deposit the bottom was raised, the bay again converted into marsh or meadow, upon which vegetation again flourished for a thousand years, till the materials of a second bed of coal (No. 2) three feet nine inches thick were collected. A third submergence took place, nineteen fathoms of rocky strata were deposited, the water again shoaled into land capable of bearing plants; a third period of forests commenced, and continued till the mass of vegetable matter destined to form the bed of coal No. 3, six feet thick, was accumulated. This was followed by a fourth subsidence, during which six fathoms of strata were deposited. The land, by this addition, again rose above water, was clothed with wood, and materials for a fourth bed of coal were accumulated. I need not pursue the series of changes further. The land must have subsided more than thirty times, and descended through a space of 3000 feet, from the formation of the coral limestone to that of the uppermost beds of the group; and after these subsidences were completed, a series of counter movements, resulting partly from the agency of trap, must have again elevated a great portion of the beds above water. Such numerous changes, when surveyed in the aggregate, and without reference to time, appear inconsistent with the usual stability of nature; but the inconsistency vanishes on a little reflection. The changes now produced by earthquakes, and the faults and fractures of the coal strata, assure us beyond all doubt that rocky masses have undergone movements both of subsidence and elevation; and as to their great number or apparent frequency in this instance, when we consider them as diffused over a period of half a million or a million of years, it is obvious at once that the objection loses its force.

It is inferred that the water under which the sandstone and shale were deposited, was chiefly that of lakes; for five-sixths of the plants, according to Adolphe Brongniart, are such as grow on land or in fresh water. Of the tribe of Algae, comprehending sea-weeds, he found none. The scales and teeth, however, of the great predaaceous fishes formerly mentioned, and the shells of genera allied to the mussel and oyster, indicate that salt or brackish water was occasionally present.

The repeated subsidences, so many in number, form one objection (and there are others) to this hypothesis; and yet, if the coral limestone exists, as we have every reason to believe, under the Newcastle and Durham coal-fields, at the depth of 2000 feet or more beneath the sea, the fact of subsidence to this extent is proved; for it is now admitted that all corals were formed at or near the surface of the ocean. Whether this subsidence took place at once, or by successive stages, is immaterial.

The other hypothesis is thus explained by Professor Phillips, with reference to the coal formation of Yorkshire. The alternating beds he attributes to alternating currents from different points of the compass, charged with different sediments, and passing into a great estuary or lake. Lime, he thinks, was transported by the marine currents from the south-east, because the limestone beds are thickest in that direction, and thinnest towards the opposite point: argillaceous sediment was swept in by a river from the west, the shales being thickest in that direction; while sand and floating wood were drifted from the north, the beds of coal and sandstone being thickest in that direction. This hypothesis, like the other, involves various difficulties, of which two may be mentioned. Of the four currents bearing wood, sand, clay, and lime, how did it happen that three so generally suspended their action, while the fourth was operating? Again, supposing the wood to be floated from the north by a river which inundated its banks like the Mississippi, it is plain that such a stream could carry off only a small part, probably not one-thirtieth, of the spoils of the forest annually deposited in its hydrographical basin. It follows, that to furnish materials for a bed of coal extending over a given space, the river must have drawn its waters from an area thirty times as large as would be required if the wood was carbonised where it grew, or the period must have been thirty times as long. But, looking to the extent (once much greater than it now is) of the coal formations in the north of England and Scotland, where is the continent to be found in which such a river could exist? Mr Phillips, in fact, finds it necessary to admit, that the large tracts of land required to furnish the sediments of sand and clay, and the masses of vegetable matter, have disappeared in the northern and western oceans.

The fossils of the coal measures are chiefly plants. They are most abundant in the shale, but are also found in the sandstone. They generally lie on their sides; but various examples have been found of trees standing erect, piercing through several beds, with their roots spread out, and so circumstanced as to lead to the conclusion that they have been converted into stone at the very spot where they grew. Fossil trees seldom exceed a few feet in length; but examples are cited of some 20 feet long, found in what is considered their native locality. Their roots are sometimes in

sandstone, but more frequently in a bed of shale, which had originally consisted of fine mud, and formed the soil in which they grew. Trees which had been transported from their native seat, are, however, infinitely more common, and these have been found of great length. A magnificent specimen was exposed in Craigleith quarry in 1833. Its colour approaches to black; it is about three feet in diameter; and there were above twenty feet of its length exposed when I saw it in 1834. It has no branches, but the scars where branches had been inserted, are well marked. It has been ascertained, by slicing, to be a Conifera of the genus Araucaria, of which living species exist in New Holland. Like its modern type, the fossil tree wants those concentric rings which mark the annual additions made to the growth of pines. It penetrates the sandstone obliquely, at an angle perhaps of 20 degrees."

"AMERICAN SCENERY."

A work under this general title is at present in the course of publication,* twenty out of thirty parts having already appeared. Each part contains four views, with appropriate letter-press. The engravings are executed in good style from drawings by Mr W. H. Bartlett, and the letter-press is contributed by Mr N. P. Willis, author of "Pencilings by the Way." As calculated to introduce us, at a moderate cost, to the magnificent natural scenery of the western republic, and the external aspect of its principal cities and public buildings, we consider this work entitled to general patronage. In the numbers already published, besides the comparatively well-known wonders of Niagara and the Hudson, we find a great variety of lake and river scenery of the most beautiful description, several impressive scenes from the White Mountains and other Alpine regions, and some of the more celebrated waterfalls, the whole eminently tending to justify what has been said by Transatlantic travellers respecting the grand scale on which the natural features of America are constituted. There is, in particular, one peep from a tangled wood, giving to the eye at once forty miles of unbroken forest, with Lake Ontario as a faint thin line in the distance, which strikes us as one of the finest pictures we have ever seen, having all the Martin sublimity with the advantage of truth.

The descriptive matter is executed with that lively ease which gave the "Pencilings by the Way" so much popularity. We pass over descriptions of scenery as likely to be of little force without the aid of the drawings; but a few specimens of other matter, introduced by Mr Willis to help out his text, will convey a notion of the pleasant literary character of the work. The following relates to the general circumstances attendant upon a landing of the steamers at Albany.

"The association most people have with Albany, is that of having lost a portmanteau there. The north river steam-boats land you, with from three to seven hundred passengers, upon a narrow pier, in the dusk of the evening, where you find from three to seven hundred individuals (more or less), each of whom seems to have no other object in life, than to persuade you, at that particular instant, to go by a certain conveyance, or to stop at a certain hotel. Upon setting your foot on shore, you find yourself among five or six infuriated gentlemen, two or three of whom walk backward before you, and all talking at the pitch which is necessary to drown the deepening hiss of the escape-valve and each other's voices. If you attempt to reason, you have no sooner satisfied the aforesaid six that your route, your baggage, and your choice of an hotel, are matters in which they cannot be of the slightest assistance to you, than six more take their places, who must be satisfied as well; and so on in the same order. If you resolutely shut your lips, silence is taken for consent; your baggage is seized, and disappears before you have recovered from your amazement; and your only course is to follow the most importunate of your remaining five persecutors to an hotel, advertise in the next morning's paper for your portmanteau, and wait in Albany till it returns from Canada or Lake Erie, or till you are reconciled to its loss.

One of the most amusing scenes in the world, if it were not so distressing, is to see a large family of rather respectable emigrants landed by the steamer in Albany. It is their first step inland; and with all the confidence of those who are accustomed to countries where a man's person and property are outwardly respected, they yield their children and baggage to the persuasive gentlemen who assure them that all is right; and if a passing wonder crosses the mind of the sufferer, that his route should be so immediately comprehended by a perfect stranger, it is chased away the next moment by his surprise at the scene of bustle and confusion. At the end of five minutes the crowd thins a little, and he looks

* Virtue, London.

about for his family and effects. A stage-coach is dashing off at top-speed in one direction, with his eldest daughter stretching out of the window, and crying in vain that there is some mistake; his two youngest are on board a steam-boat just off from the pier, and bound eight miles farther up the river: the respectable part of his baggage has entirely disappeared; and nothing but his decrepit grandmother and the paternal bedstead (both indebted for their escape to being deaf, and not portable) remain of his family and chattels. For his comfort, the gentry around inform him that his children may be got back in a day or two, and he may find his baggage somewhere on his route to the west—offering, for a consideration not very trifling, to send off an express for either one or the other."

The singular town of New Haven, the seat of Yale College, in Connecticut, is thus depicted:—"The area occupied by the town of New Haven is estimated to be six times as great as that of a European town with the same number of inhabitants. It was originally laid out in parallelograms, and the houses are built upon the outer sides of the squares, with large gardens meeting in the centre. Almost every house stands separate, and surrounded by shrubbery and verdure; and it is the great peculiarity of the town, that all its streets are planted with rows of elms, grown at this day to remarkable size and luxuriance. It has the appearance of a town roofed in with leaves; and it is commonly said, that, but for the spires, a bird flying over would scarce be aware of its existence. Nothing could be more beautiful than the effect of this in the streets; for, standing where any of the principal avenues cross at right angles, four embowered aisles extend away as far as the eye can follow, formed of the straight stems and graceful branches of the drooping elm, the most elegant and noble of the trees of our country. The roads below are kept moist and cool with the roof overhead; the side-walks, between the trees and the rural dwellings, are broad and shady; the small gardens in front of most of the houses are bright with flowering shrubs; and the whole scene, though in the midst of a city, breathes of nature."

The style of domestic architecture in New Haven favours the rural character of the town. Built, as was remarked before, in the midst of a garden, each house looks like what would be termed in England a cottage, or, in streets where a more ambitious style prevails, like the sort of white villa common at watering-places. The green Venetian blind is universal; the broad open hall extends through the house, showing the gay alley of a garden in the rear; and, living in the midst of a primitive and friendly community, the inhabitants sit at their low windows along the street, or promenade, without fear of rude observation, on the shady pavement before their dwellings, preserving for the place altogether that look of out-of-doors life and gaiety which, with less elegance, distinguishes Naples and other cities of southern Europe. The prettiest of English rural towns have a general resemblance to it."

Although Mr Willis acknowledges that little interest is attached in America to the scenes of remarkable events, the eager youthful spirit of the nation pressing quickly over and obliterating the traces of the past, he overlooks no remarkable incident or crisis of affairs connected with the localities which fall under his notice. Many incidents of the war of independence in city, as well as in country, are thus adverted to. A number of legends respecting the hostilities between the early settlers and the native Indians are also given, the balance of barbarity being by no means on the side of the latter. The following is one of this class of legends, which Mr Willis extracts from a work entitled "The New Mirror for Travellers":—

"Little more than a century ago, the beautiful region watered by this stream [a rivulet called Murderer's Creek,] was possessed by a small tribe of Indians, which has long since become extinct, or been incorporated with some other savage nation of the West. Three or four hundred yards from where the stream discharges itself into the Hudson, a white family, of the name of Stacey, had established itself in a log-house, by tacit permission of the tribe, to whom Stacey had made himself useful by his skill in a variety of little arts highly estimated by the savages. In particular, a friendship existed between him and an old Indian called Naoman, who often came to his house and partook of his hospitality. The Indians never forgive injuries or forget benefits. The family consisted of Stacey, his wife, and two children, a boy and girl, the former five, the latter three years old."

The legend goes on to say, that Naoman, in grateful friendship, gave the wife of Stacey a secret warning that a massacre of the whites was resolved on, exacting from her a solemn pledge of secrecy, and advising instant escape across the river.

"The daily visits of old Naoman, and his more than ordinary gravity, had excited suspicion in some of the tribe, who had accordingly paid particular attention to the movements of Stacey. One of the young Indians, who had kept on the watch, seeing the whole family about to take their boat, ran to the little Indian village, about a mile off, and gave the alarm. Five Indians collected, ran down to the river side, where their canoes were moored, jumped in, and paddled after Stacey, who by this time had got some distance out into the stream. They gained on him so fast, that twice he dropped his paddle, and took up his gun. But his wife prevented his shooting, by telling him, that if he fired, and they were afterwards overtaken, they would meet no mercy from the Indians. He accordingly refrained,

and plied his paddle, till the sweat rolled in big drops down his forehead. All would not do; they were overtaken within a hundred yards of the shore, and carried back with shouts of yelling triumph.

When they got ashore, the Indians set fire to Stacey's house, and dragged himself, his wife, and children, to their village. Here the principal old men, and Naoman among the rest, assembled to deliberate on the affair. The chief among them stated that some one of the tribe had undoubtedly been guilty of treason, in apprising Stacey, the white man, of the designs of the tribe, whereby they took the alarm, and had well nigh escaped. He proposed to examine the prisoners as to who gave the information. The old men assented to this, and Naoman among the rest. Stacey was first interrogated by one of the old men, who spoke English, and interpreted to the others. Stacey refused to betray his informant. His wife was then questioned, while at the same moment two Indians stood threatening the two children with tomahawks in case she did not confess. She attempted to evade the truth, by declaring she had a dream the night before which had alarmed her, and that she had persuaded her husband to fly. 'The Great Spirit never deigns to talk in dreams to a white face,' said the old Indian: 'woman! thou hast two tongues and two faces: speak the truth, or thy children shall surely die.' The little boy and girl were then brought close to her, and the two savages stood over them, ready to execute their bloody orders.

'Wilt thou name,' said the old Indian, 'the red man who betrayed his tribe? I will ask thee three times.' The mother answered not. 'Wilt thou name the traitor? This is the second time.' The poor mother looked at her husband, and then at her children, and stole a glance at Naoman, who sat smoking his pipe with invincible gravity. She wrung her hands and wept, but remained silent. 'Wilt thou name the traitor? 'Tis the third and last time.' The agony of the mother waxed more bitter; again she sought the eye of Naoman, but it was cold and motionless. A pause of a moment awaited her reply, and the next moment the tomahawks were raised over the heads of the children, who besought their mother not to let them be murdered.

'Stop!' cried Naoman. All eyes were turned upon him. 'Stop!' repeated he in a tone of authority. 'White woman, thou hast kept thy word with me to the last moment. I am the traitor. I have eaten of the salt, warmed myself at the fire, shared the kindness of these Christian white people, and it was I that told them of their danger. I am a withered, leafless, branchless trunk; cut me down if you will. I am ready.' A yell of indignation sounded on all sides. Naoman descended from the little bank where he sat, shrouded his face with his mantle of skins, and submitted to his fate. He fell dead at the feet of the white woman by a blow of the tomahawk."

We conclude with a whimsical description of Congress Hall, the principal hotel used by the New England fashionables who flock to the salt springs of Saratoga. "It is an immense wooden caravanserai, with no pretensions to architecture beyond what is seen in the drawing, and built with the sole view of affording the average accommodations of packed herrings to an indefinite number of persons. The roominess and liberal proportions of the Colonnade are one of those lies of architecture common to the hotels of this country. The traveller passes from the magnificent promise of the outside, to a chamber ten feet by four, situated in a remote gallery, visited once a-day by the 'boots' and chambermaid. His bed, chair, and washstand, resemble those articles as seen in penitentiaries; and if he chance to be ill at night, he might die like a Pagan, 'without bell or candle.' The arrangements of the house are, of necessity, entirely gregarious. A bell rings at half-past seven in the morning, at which every body who intends to breakfast, must get up; another bell at eight, to the call of which, if he prefers hot omelette to cold, he must be punctual. Dinner and tea exact the same promptitude; and the latter, which in other countries is a thing of no circumstance or importance, becomes, where you dine at two, a meal not willingly missed. 'Tea' is at six or half-past, and consists of cold meats, hot rolls, Indian cakes, all other kinds of cakes, all kinds of berries, pies, sweetmeats, and jellies, coffee and tea. This is not a matter to be slighted after a fast of four hours; and home hurry beaux and belles from their abbreviated drives, with a loss of sentiment and sunset, and with profit to the keepers of stables, who let their horses 'by the afternoon.'

After tea, the gentlemen who dressed for dinner and 'undressed' for their drive, dress once more for the evening, and the spacious Colonnade is thronged with the five hundred guests of the house, who pace to and fro for an hour, or, if it is a ball night, till the black band have made an orchestra of the tables in the dining-room, and struck up 'Hail, Columbia!' A hoop, bound with evergreens, and stuck full of candles, hangs in the centre of the hall (*ci-devant* dining-room); an audience of all the negroes in the establishment sweetens the breath of heaven as it steals in at the windows; and, as the triumphant music returns a second time to the refrain, the lady patroness enters on the arm of the gentleman who has the most stock in the bank, followed in couples by all the gentlemen and ladies who intend to dance or play wall-flower. The black musicians 'vex their instruments,' and keep time with their heads and heels, as if all their extremities had been hired; the beaux who were interrupted in their declamations by the last *chassé* (if they wish to go on with it), lead out their partners to take the air and a cold—

perhaps a heart—on the Colonnade; and at eleven, champagne goes round for the ladies, and the gentlemen take 'summat to drink' at 'the bar;' after which the candles burn brighter, and every body is much more agreeable."

OCCASIONAL NOTES.

PAINTING BY THE ACTION OF LIGHT.

It has long been known that a surface covered by the nitrate of silver became black when exposed to the light, and that, when light fell in different degrees of intensity on this surface, the blackness was produced with various degrees of rapidity, or, what was the same thing, in different degrees of depth, in proportion as the light fell strongly on those parts or not. Many years ago, Mr Wedgwood, the celebrated improver of pottery, and Sir Humphry Davy, made experiments with a view to turn these chemical facts to account in causing objects to *paint themselves*, for they rightly calculated that the rays of light proceeding from any object would affect such a surface as is described, differently, according as they proceeded from light or dark parts of the object, and would thus produce an effect on the prepared surface not unlike the lights and shades of a common drawing, and which would be in reality a picture or representation of the object. Various difficulties caused these gentlemen in the long-run to abandon their design, but it has lately been revived with success by Mr Henry Fox Talbot, F.R.S., and contemporaneously, as it happens, by a Frenchman named Daguerre. The invention of the latter individual was expounded by M. Arago to the Academy of Sciences at Paris, on the 8th of January last, without particularising the chemical substances employed. Mr Talbot's experiments were immediately after detailed to the Royal Society in London, without any attempt to conceal the nature of the processes. From the explanations presented on this occasion by Mr Talbot, we are enabled to lay the following account of Photogenic Drawing, as it is called, before our readers.

Mr Talbot commenced his experiments in the spring of 1834, in ignorance, as he informs us, that anything of the kind had been attempted before. He at first expected that, if he should succeed in causing light to impress pictures on prepared surfaces, he should be obliged to keep them immured in a portfolio, and look at them only by candle-light, as any exposure of them to the sun's light would for certain, unless somehow prevented, cause the surface to be speedily blackened all over uniformly, by which the picture would of course be obliterated. In time, however, Mr Talbot discovered a method by which, when the drawing was effected, he could render the paper insusceptible of any further action from the light, so that the drawing might be considered as fixed. Without following him through the various steps by which he finally arrived at the present stage of the invention, we may mention that he prepares his paper in the following manner. Having selected it of a firm quality and smooth surface, he dips it in a weak solution of common salt, dries it, and then spreads its surface with nitrate of silver, which he dries at a fire. Afterwards, he washes it alternately for a considerable number of times with saline water and a solution of silver, by which process the sensibility of the paper is increased. The paper is presented to the object by means of a camera obscura, and the time usually required for producing the effect is about a quarter of an hour. When finished, he washes the picture with a weak solution of iodide of potassium, which, transforming the former preparation into an iodide of silver, renders it thenceforth "absolutely unalterable by sunshine." The same effect may be produced in a simpler way by giving the picture one more washing in dissolved salt; for, strange to say, the same solution which formerly increased the sensibility of the paper, now destroys it.

The images obtained are white, but the ground on which they display themselves is variously and pleasingly coloured. As far as we can judge from a not very clear description, the effect is like that of certain stone-ware, in which the whole ground is blue, and the figures are produced by open or white lines. The various grounds producible are sky-blue, yellow, rose-tint, brown, and black: green, contrary to what might have been expected, has not been obtained. To quote Mr Talbot's own words, "The first kind of objects which I attempted to copy by this process were flowers and leaves, either fresh or selected from my herbarium. These it renders with the utmost truth and fidelity, exhibiting even the venation of the leaves, the minute hairs that clothed the plant, &c. &c."

It is so natural to associate the idea of *labour* with great complexity and elaborate detail of execution, that one is more struck at seeing the thousand florets of an *Agrostis* depicted with all its capillary branchlets (and so accurately that none of all this multitude shall want its little bivalve calyx, requiring to be examined through a lens), than one is by the picture of the large and simple leaf of an oak or a chestnut. But in truth the difficulty is in both cases the same. The one of these takes no more time to execute than the other; for the object which would take the most skilful artists days or weeks of labour to trace or to copy, is effected by the boundless powers of natural chemistry in the space of a few seconds. To give an idea of the degree of accuracy with which some objects can be imitated by this process, I need only mention one instance. Upon one occasion, having made an image of a piece of lace of an elaborate pattern, I showed it to some persons at the distance of a few feet, with the inquiry, whether it was a good representation? when the reply was, "That they were not so easily to be deceived, for that it was evidently no picture, but the piece of lace itself."

He proceeds to speak of what he calls *The Art of Fixing a Shadow*. "The phenomenon which I have now briefly mentioned, appears to me to partake of the character of the *marvellous*, almost as much as any fact which physical investigation has yet brought to our knowledge. The most transitory of things, a shadow, the proverbial emblem of all that is fleeting and momentary, may be fettered by the spells of our 'natural magic,' and may be fixed for ever in the position which it seemed only destined for a single instant to occupy. This remarkable phenomenon, of whatever value it may turn out in its application to the arts, will at least be accepted as a new proof of the value of the inductive methods of modern science, which, by noticing the occurrence of unusual circumstances (which accident perhaps first manifests in some small degree), and by following them up with experiments, and varying the conditions of these until the true law of nature which they express is apprehended, conducts us at length to consequences altogether unexpected, remote from usual experience, and contrary to almost universal belief. Such is the fact, that we may receive on paper the fleeting shadow, arrest it there, and in the space of a single minute fix it there so firmly as to be no more capable of change, even if thrown back into the sunbeam from which it derived its origin."

In the paper which we are quoting, Mr Talbot details the purposes to which he has applied his method with success. It appears to be suitable for the copying of stained glass, for the representation of minute objects through the intervention of the solar microscope, for the copying of engravings and sculptures, and in general for representing natural and artificial objects—the only failures occurring, we believe, where the object is not quite at rest. The account of his first experiments with the camera obscura in the representation of scenery, is extremely interesting:—"Not having with me in the country a camera obscura of any considerable size, I constructed one out of a large box, the image being thrown upon one end of it by a good object-glass fixed in the opposite end. This apparatus being armed with a sensitive paper, was taken out in a summer afternoon, and placed about one hundred yards from a building favourably illuminated by the sun. An hour or two afterwards, I opened the box, and I found depicted upon the paper a very distinct representation of the building, with the exception of those parts of it which lay in the shade. A little experience in this branch of the art showed me that with smaller camera obscuræ the effect would be produced in a shorter time. Accordingly, I had several small boxes made, in which I fixed lenses of shorter focus, and with these I obtained very perfect but extremely small pictures: such as, without great stretch of imagination, might be supposed to be the work of some Lilliputian artist. They require indeed examination with a lens to discover all their minutiae. In the summer of 1835, I made in this way a great number of representations of my house in the country, which is well suited to the purpose, from its ancient and remarkable architecture. And this building I believe to be the first that was ever yet known to have drawn its own picture. The method of proceeding was this: Having first adjusted the paper to the proper focus in each of these little camera, I then took a number of them with me out of door, and placed them in different situations around the building. After the lapse of half an hour, I gathered them all up, and brought them within doors to open them. When opened, there was found in each a miniature picture of the objects before which it had been placed. To the traveller in distant lands who is ignorant, as too many unfortunately are, of the art of drawing, this little invention may prove of real service; and even to the artist himself, however skilful he may be. For although this natural process does not produce an effect much resembling the productions of his pencil, and therefore cannot be considered as capable of replacing them, yet it is to be recollected that he may often be so situated as to be able to devote only a single hour to the delineation of some very interesting locality. Now, since nothing prevents him from simultaneously disposing, in different positions, any number of these little camera, it is evident that their collective results, when examined afterwards, may furnish him with a large body of interesting memorials, and with numerous details which he had not had himself time either to note down or to delineate."

In thus presenting an account of Mr Talbot's invention, our sole object is to acquaint our readers with what appears a very wonderful discovery. That it will ultimately be found to answer all the contemplated ends, or add any thing to the triumphs of imitative art, is more than we are prepared to certify. This, time and further experiment alone can try.

HOSPICE OF THE GREAT ST BERNARD.

THIS conventual establishment, famous in the annals of continental travelling, is situated on the mountain of the Great St Bernard, in the alpine regions of Switzerland. The Hospice stands at the very highest point of a great pass, connecting Italy and the Valais, and renowned as the route by which Napoleon carried his legions to the field of Marengo, and the conquest of Italy. The height of this pass above the level of the sea, at the point where the Hospice is placed, is 1275 toises, or 7542 French feet, according to Saussure. The spot is thus the highest inhabited ground in Europe. The route is wild and precipitous in the most extreme degree, and is covered and enveloped by perpetual snows. Travelling is therefore very hazardous, and in particular during the seasons of winter and spring, at which latter period the avalanches fall with terrible frequency, through the partial loosening of the snow. Yet the pass of the Great St Bernard is much frequented, as it saves an immense round-about to those journeying between Italy and the Valais. Nor are travellers deterred by the fact that scarcely one winter passes without lives being lost in the pass. And many more would be periodically sacrificed, but for the existence of the noble establishment which we are about to describe, the Hospice of the Great St Bernard.

At what time the convent known by this name was originally founded, is not satisfactorily known. The most credible account represents the establishment as having been at first a sort of post for the protection of travellers from the predatory bands infesting the pass. Subsequently, it fell under the charge of a body of monks of the order of St Augustine, who took upon themselves the task of relieving the wants of travellers, and aiding them to escape the dangers with which nature has encompassed the route. That it might fulfil these objects effectually, the establishment was liberally endowed with lands and revenues to defray its expenses. In the course of time, the greater part of these funds were withdrawn, and at the present day the Hospice enjoys only some petty rents in the Valais, being indebted for support otherwise, chiefly to charitable contributions from various parts of Catholic Europe. The same monastic brotherhood still retains the charge of the Hospice. It is a large lengthy building, very irregular in its construction, and in any other situation would be held gloomy in appearance; but rising, as it does, in the midst of a wintry solitude, its view is to travellers the most cheering that can be well imagined. The ordinary purposes of the establishment, as it has been long conducted, are simply those of an inn, but an inn where the entertainer receives and cherishes his guests gratuitously. On this footing are received all travellers whatever, whom business, curiosity, or pleasure, may lead across the pass of the Great St Bernard. "Here (says a visitor to the Hospice) rich and poor, Jews, Pagans, and Christians, persons of all ages, sexes, sorts, and conditions, are received with a kindness and courtesy which know no distinctions; their wants are supplied, and their sufferings are assuaged; no prying questions are asked, no remuneration is demanded, none is (individually) accepted. In a corner of the little chapel stands a box, into which those who can afford it, and who please to do so, may drop their contributions for the support of this admirable institution; but no hint is given, not even is the existence of the box indicated to the guest; if he finds it out and contributes, the act is entirely voluntary."

In this manner is the passing traveller entertained at this hospitable resting-place amid the alpine snows. The duties of the establishment are performed by ten or twelve individuals, who are regular canons of the order of St Augustine. In all, the *religieux* of St Bernard amount in number to between twenty and thirty, but of these a portion are always absent on missions or other duties, while others reside temporarily at Martigny, a town at the base of the mountain, where there is a house belonging to the fraternity. The principal functionaries are the provost, or superior; the prior; the sacristan, who has charge of the chapel; the steward; the cellarer, or purveyor; and the hospitaller, who superintends the infirmary. Almost all the brethren resident at the Hospice are young men, the climate being too severe for persons advanced in life. On this account, the provost, usually an old man who has spent the best part of his days in serving the order, is privileged to remain at Martigny, visiting the Hospice only once a-year, on the festival of St Bernard, to hold a chapter for the examination of novices. The prior for the most part resides, as acting superior, at the Hospice. A noviciate of one year is the course preparatory to admission as canons; but even to be received as a novice requires in the party a good education, a fair character, and a respectable standing in society. It is highly to the honour of these regions that men should be found ready to devote their lives thus to acts of charity, as well as to the continued endurance of no ordinary hardships and privations. Independently of incidental sufferings, the residents

at the Hospice are much afflicted with pains in the head, eyes, and ears, as well as with indigestion; evils arising from the elevated atmosphere around them, and from the want of proper exercise for a great part of the year. The habits of the brotherhood are simple and regular. They rise early, breakfast at seven, dine at one, and sup at seven. The rest of their time is spent in devotion, or in cultivating the elegant accomplishments of drawing and music; while some of them, again, love to wander abroad, when the weather is favourable, and amuse themselves by examining the botanical or mineralogical features of the precipitous country around. Towards their guests, who are much more numerous in summer than one would readily imagine, the fraternity conduct themselves with the utmost courtesy and kindness. They converse frankly, and often surprise visitors by the exhibition of minds abounding as well in natural genius as in acquired information. To their lady-visitors, who often appear in considerable bands at the Hospice, the residents are most laudably attentive, and indeed have fitted up a saloon, for their especial use, in a most tasteful manner. This was rendered somewhat necessary by a rule of the order, which forbids the entrance of females into the refectory of the building. So much have many lady-visitors been gratified by the entertainment given to them by the brethren of the Hospice, that numerous little presents have been left or sent in consequence, most of which now adorn the walls and tables of the saloon. One is in the respectable form of a piano-forte. The provisions of the convent are usually brought from Martigny, which can be reached on mules in ten or twelve hours. A garden also furnishes various necessities in summer.

Such is the character of the residents of the Hospice, as well as of the ordinary duties which they cheerfully perform. But they are often summoned to give assistance in cases of greater emergency than those of merely wearied travellers, and they show an equal readiness to answer the summons. In the winter and spring—that is, from November till May—they hold a perpetual watch for travellers endangered in the pass by snow-storms or avalanches. Every day about noon, an active and experienced servant of the Hospice, called the *Marronnier*, leaves the convent and goes about three miles down the pass to a spot where there is a small sheltered cot. In the neighbourhood of this there is an eminence, commanding an extensive view of the pass. The *Marronnier* ascends this height, and calls as loudly as he can. If his experienced eye and ear meet no reply, he returns to his shelter, but re-ascends in a short time, and again makes his voice ring among the rocks. This process he repeats until the hour comes when he has to return to the convent to prevent the monks becoming alarmed about himself. In this expedition, the *Marronnier* is provided with wine and other restoratives in a basket, which basket is borne by a faithful and docile companion, a dog. The dogs of the Hospice have acquired great celebrity for their sagacity. They are usually of great size, of a dark brown colour, with shaggy coats, and very gentle in temper. They are remarkably quick in comprehending the wishes of their masters, whether expressed by signal or word, and they bark at command. As their bay is loud and deep, their value is great in this respect alone, from their directing wanderers to any given spot, or informing them of aid at hand. With one of these fine animals to bear him company, the *Marronnier* performs his duties. If he finds any straggling traveller, he either brings him to the convent, or leaves him in the sheltered hut, and goes for assistance. Should the *Marronnier* not return at the wonted time, the monks then know that either he himself requires help, or that he has fallen in with others who do, and a party immediately sets out to render it, taking with them the other dogs of the Hospice, which seldom in all exceed four in number. The principal use of these creatures lies in their marvellous ability to keep the track, however deep the snow may be. They have also a strong scent, which leads them to the discovery of human bodies. Under the guidance of these dogs, the monks set out to give their help to the *Marronnier*, whether he individually, or others, may be the party requiring it. If they find straggling, but still living travellers, the monks supply them with the necessary restoratives, and get them conveyed to the convent. If dead bodies, as is but too often the case, are the objects discovered, these are placed in a small shed with grated windows, near the hut of the *Marronnier*; and there they lie, until recognised and claimed by friends. From the low temperature of the region, bodies will remain here without decay for a whole year.

Of course, the fraternity of the Hospice do not give up as lost the unfortunates whom they find in the snow, without the liberal use of all possible remedies to revive them, and in the application of such means their experience has made them remarkably skilful. To attempt the sudden restoration of heat in such cases, it is well known, is a fatal step. The monks use friction with snow and ice-water in the cases that fall under their charge, and their practice is attended with much success. The number of persons whom they rescue annually from the brink of destruction is very great, and as most of these are poor persons who have attempted to traverse the pass without guides, *gratitude* is the only return in general made to the fraternity for such services. "This the monks know well," says the visitor already quoted; "yet their humanity is unabated, and their efforts

unrelaxed. When the rank and circumstances of those who enter this order, voluntarily to embrace poverty and privations, to encounter the dangers and terrors to which they must be exposed in the exercise of their duties, and to brave a climate so rigid and ungenial, that even the hardest constitutions cannot long withstand its severities—when these things are considered, it is impossible to conceive that any thing but the most exalted sense of duty, and the most enthusiastic and chivalrous devotion to the cause of humanity, could dictate a choice of life so full of hardships, and so destitute of attractions." The fraternity, it ought to be mentioned, keep watch on both sides of the mountain. A Maronnier descends regularly on the side of the Valais, as well as on the Italian side, and travellers are preserved from danger, from whatever quarter they may ascend. By the wealthier orders, the ascent is usually accomplished on mules accustomed to the journey. Yet, even with guides and every other provision that can be made, the drifting and falling of snow, as well as the sinking of avalanches—large enough sometimes to fill up whole valleys—the pass is for a great part of the year a dangerous route to all.

The road over the Simplon, in the same alpine ranges, is one of the real benefits that Napoleon conferred on mankind, during his extraordinary career. He also planned a road over the Great St Bernard, and, but for his sudden fall, would have executed it in all probability. Many anecdotes are preserved relative to his famous passage on this way with his troops. Napoleon talked familiarly with the guide who attended him personally on the route, and learnt from the man that the passage of the army had disturbed all the ordinary business of the district, and had prevented himself from building a house which he had begun. Though desired by Napoleon not to go home without seeing him, the man was afraid of being impressed into permanent service, and took leave of the army secretly. Five years afterwards, a messenger came in quest of the same guide, and paid, by orders of Bonaparte, the whole expenses attending the erection of the house alluded to. Considering the multiplicity of Napoleon's affairs, this act was more extraordinary as an exertion of memory, than on account of its munificence. Another memorial of the grand army's passage over the Great St Bernard is to be found in the monument erected to Desaix by his friend and chief, and which stands in the chapel of the Hospice. Most readers will remember that it was to Desaix that Napoleon owed the all-important victory of Marengo.

Enough has now been said to give the reader an idea of the character and objects of this excellent institution. The philanthropy and generous devotion of its residents well deserve, indeed, that in all quarters of the civilised world men should hold in honourable remembrance the Hospice of the Great St Bernard.

ADVANCEMENT OF EDUCATION IN GREECE.

It is very pleasing to know that in Athens—the true Athens in Greece—now in the course of regeneration, education is going on prosperously, or has, at least, begun to advance with spirit and every appearance of success. A few particulars of this improvement in the social condition of the modern Athenians, are given by Mr Stephens, an American, in his recently published work, "Incidents of Travel." According to him, the principal agent in putting this great power in operation, has been an Episcopal missionary from the United States, of the name of Hill; and we can well understand Mr Stephens's feelings, when he speaks of the proud satisfaction it gave him to find, "that, in the city which surpassed all the world in learning, where Socrates and Plato and Aristotle taught, the only door of instruction was that opened by the hands of American citizens, and an American missionary was the only schoolmaster." In 1831, Mr Hill first established himself with his family in Athens, bringing printing-presses with him, and other auxiliaries for his purpose. The people of the United States having sent provisions to Greece in a very critical moment of the late struggle, the missionary found the Athenians favourably disposed towards him and the objects he had in view. He opened a school for boys, while Mrs Hill took charge of another for girls, professing to give secular instruction only, or at least avoiding, in their religious instructions, all points calculated to excite the prejudices of the Greeks. The school, at the time of Mr Stephens's visit, numbered not less than five hundred pupils. "The boys' school (says he) is divided into three departments, the lowest under charge of a Greek qualified on the Lancasterian system. They were of all ages, from three to eighteen; and, as Mr Hill told me, most of them had been half clad, dirty, ragged little urchins, who, before they were put to their A, B, C, or rather their Alpha, Beta, Gamma, Delta, had to be thoroughly washed, rubbed, scrubbed, doctored, and dressed, and, but for the school, would now perhaps be prowling vagabonds in the streets of Athens, or training for robbery in the mountains. They were a body of fine-looking boys, possessing, as Mr Hill told me, in an extraordinary degree, all that liveliness of imagination, that curiosity and eagerness after knowledge, which distinguished the Greeks of old, retaining,

under centuries of dreadful oppression, the recollection of the greatness of their fathers, and, what was particularly interesting, many of them bearing the great names so familiar in Grecian history; I shook hands with a little Miltiades, Leonidas, Aristides, &c., in features and apparent intelligence worthy descendants of the immortal men whose names they bear. And there was one who startled me; he was the son of the Maid of Athens (celebrated by Byron)! To me the Maid of Athens was almost an imaginary being, something fanciful, a creation of the brain, and not a corporeal substance, to have a little urchin of a boy. But so it was. The Maid of Athens is married. She had a right to marry, no doubt; and it is said that there is poetry in married life, and, doubtless, she is a much more interesting person now than the Maid of Athens at thirty-six could be.

The principal and most interesting part of this missionary school was the female department, under the direction of Mrs Hill, the first, and, except at Syra, the only school for females in all Greece, and particularly interesting to me from the fact that it owed its existence to the active benevolence of my own countrywoman. At the close of the Greek revolution, female education was a thing entirely unknown in Greece, and the women of all classes were in a most deplorable state of ignorance. When the strong feeling that ran through our country in favour of this struggling people had subsided, and Greece was freed from the yoke of the Mussulman, an association of ladies in the little town of Troy, perhaps instigated somewhat by an inherent love of power and extended rule, and knowing the influence of their sex in a cultivated state of society, formed the project of establishing at Athens a school exclusively for the education of females; and, humble and unpretending as was its commencement, it is becoming a more powerful instrument in the civilisation and moral and religious improvement of Greece, than all that European diplomacy has ever done for her. The girls were distributed in different classes, according to their age and advancement: they had clean faces and hands, a rare thing with Greek children, and were neatly dressed, many of them wearing frocks made by ladies at home (probably at some of our sewing societies); and some of them had attained such an age, and had such fine, dark, rolling eyes as to make even a northern temperament feel the powerful influence they would soon exercise over the rising, excitable generation of Greeks, and almost make him bless the hands that were directing that influence aright.

Before we went away the whole school rose at once, and gave us a glorious finale with a Greek hymn. In a short time these girls will grow up into women, and return to their several families; others will succeed them, and again go out, and every year hundreds will distribute themselves in the cities, and among the fastnesses of the mountains, to exercise over their fathers, and brothers, and lovers, the influence of the education acquired here; instructed in all the arts of woman in civilised domestic life, firmly grounded in the principles of morality, and of purified religion. I have seen much of the missionary labours in the East, but I do not know an institution which promises so surely the happiest results. If the women are educated, the men cannot remain ignorant."

It is pleasant to think that the people in power, and above all the king himself, should be fully sensible of the benefits likely to accrue to the whole land from this excellent seminary. The ex-secretary Rigos, after examining the female school, pointed with his hand to the Parthenon, and said with deep emotion to Mrs Hill, "Lady, you are erecting in Athens a monument more enduring and more noble than yonder temple!" Otho was "so deeply impressed with the value of the same institution (says our traveller), that, a short time before my arrival, he proposed that Mr Hill should take into his house girls from different districts, and educate them as teachers, with the view of sending them back to their districts, there to organise new schools, and carry out the great work of female education." Mr Hill acceded to the royal proposition, though it had not then been acted upon; but, long after Mr Stephens had left Greece, he received a letter from Mr Hill, in which that gentleman announced that he had then about forty persons residing with him, of whom thirty-five were Greeks, and the greater part Greek girls from various districts, all undergoing a proper training for becoming instructresses of youth in their native regions. Mr Hill had already sent out several individuals on the task of instruction, and had the most promising prospect of success from their labours.

Thus, as Greece is a country neither of very great extent nor population, there is every reason to hope that, during the lives of the rising generation, a great degree of enlightenment will have spread throughout the land. The government, however, is poor, and cannot do much to further the cause; and the greater is the merit, therefore, of the strangers who are thus philanthropically dedicating their lives to the welfare of Greece. Otho is an amiable well-intentioned youth, according to every account; though candour compels us to say that he appears to possess a truly regal spirit of profusion, being engaged in building a palace of white Pentelican marble, which is to cost three hundred thousand pounds, the whole sum in his treasury being, at the same time, something less than ten thousand. Poor as Otho's court is, the Bavarians flock to it, nevertheless, as to the land of promise; and upon

the score of their national relationship with the monarch, they take it upon themselves to lord it rather oppressively over the Greek population. Mr Stephens was an eye and ear witness of things which made him conclude that the score which the Bavarians were running up would be paid off by the Greeks in blood some day. After the high promise held out, however, in educational matters, we hope that Greece will gradually become averse to bloodshed, and that no more of her own gore or that of others will for centuries wet her regenerated plains.

HYSLOP OF GLENMANNOW.

At the head of a romantic glen in the parish of Penpont, Dumfriesshire, there resided, in the early part of the last century, an individual of the name of John Hyslop, otherwise called Glenmannow, which was the designation of a sheep-farm rented by him from the Duke of Queensberry. His almost superhuman strength of body made Glenmannow a subject of constant wonder and discourse throughout his native district, and to this hour his feats are remembered and recounted there with pride and astonishment. His appearance indicated his great physical powers, his person being of an uncommonly massive build, and about six feet in height. He was very averse to making displays of his strength, particularly where these might be injurious to others. His modesty and good nature were proverbial, and it was only when repeated provocations had overcome his patience, that his strength became a source of terror to those around. The Duke (James) of Queensberry used sometimes to put the prowess of his tenant to the proof. On one occasion he sent a party of six stout grenadiers to billet on Glenmannow, giving them a hint to behave roughly. Confident in the belief that a single man would never venture to beard them, the grenadiers used their licence freely, but narrowly escaped with their lives in consequence, being pursued to the very gates of Drumlanrig Castle by the excited Glenmannow, with the pole or *tram* of a cart upon his shoulder.

Another feat of Glenmannow is recorded in the Dumfries Magazine, from the pages of which we extract these particulars respecting this athletic countryman. "Duke James of Queensberry, like others of our nobility and gentry, resided during a part of the year in London; and on one of his visits to the metropolis, he and a party of friends happened to have a match at discus, or, as it is more commonly called, 'putting the stone.' Several attempts happened to be of the party, who boasted much of their superior strength and adroitness, and after making one of their best throws, offered to stake a large sum that not one of their companions knew of, or could find, a person to match it. 'The throw is certainly a good one,' said the Duke of Queensberry, 'yet I think it were easy to find many champions of sufficient nerve to show us a much better. I myself have a homely unpractised herdsman in Scotland, on whose head I will stake the sum you mention, that he throws the quoit fully two yards over the best of you. 'Done! produce your man,' was the reply of all; and the duke accordingly lost no time in dispatching a letter to one of his servants at Drumlanrig, ordering him to set out immediately on its receipt for Glenmannow, and to come with honest John Hyslop to London without delay. The duke's letter with Glenmannow was not less absolute than the rescript of an emperor. He wondered, but never thought of demurring, and without any further preparation than clothing himself in his Sunday's suit, and giving his wife a few charges about looking to the hill in his absence, he assumed his large staff, and departed with the servant for 'Lannum.'

On his arrival, the duke informed him of the purpose for which he had been sent, and desired that on the day and at the hour appointed, he should make his appearance along with one of his servants, who knew perfectly the back-streets and bye-lanes of London, and who, after he should have decided the bet, would conduct him immediately in safety from the ground, as it was not improbable that his appearance and performance might attract a crowd, and lead to unpleasant consequences. When the day arrived, the party assembled, and proceeded to the ground, where, to the duke's surprise, though not to his terror, his crafty opponents chose a spot directly in front of a high wall, and at such a distance that the best of their party should pitch the quoit exactly to the foot of it; so that their antagonist, to make good the duke's boast of 'two yards over them,' should be obliged to exceed them these two yards in height, instead of straightforward distance. This implied such an effort as amounted in their minds to a physical impossibility; and as the duke, from having neglected to specify the particular nature of the ground, could not legally object to this advantage, they looked upon the victory as already their own. The quoit chosen was a large ball of lead, and already had the champion of the party tossed it to the wall, and demanded of the duke to produce the man appointed to take it up. His grace's servant, who fully comprehended the instructions given him, entered at this crisis with the 'burly,' and, to them, uncouth Glenmannow. His appearance attracted no small notice, and even merriment, but the imperturbable object of it regarded the whole scene with the indifference peculiar to his character, and, with his mind fixed only upon the great end for which he was there, demanded to be shown the quoit, and the spots from which and to where it had been thrown. This demand was soon complied with; and while he assumed his station, with the quoit in his hand, the duke whispered in his ear the deception which had been practised, and urged him to exert his whole force in order to render it unavailing. 'Will you throw off your coat? It will give you more freedom,' said his grace in conclusion. 'My coat! Na, na; nae coats aff wi' me for this silly affair,' replied he. 'I thought it had been some terrible throw or other that these chaps had made, when I was ca'd for a' the way to Lannum to see to gang ayont them; but if this be a', I wadna hae mean'd ye to hae done't ye'red.' Then poising the ball for a little in his hand, and viewing it with an air of contempt, 'There!' said he, tossing it

carelessly from him into the air, 'he that likes may gang an' fetch it back.' The ball, as if shot from the mouth of a cannon, flew on in a straight line completely over the wall, and alighted on the roof of a house at some distance beyond it. Its weight and velocity forced it through the tiles; and with a crash which immediately caused the house to be evacuated by its inmates, it penetrated also the garret floor, and rolled upon that of the next story. A great hubbub ensued; but the servant knew his duty, and in a twinkling Glenmannow was no longer amongst them.

His grace, after paying for the damage done to the house, conducted the whole party to his residence, there to discharge their forfeit, and to gaze upon the prodigy by whom they were vanquished. Glenmannow was well rewarded for his trouble and loss of time in journeying to London, and, over and above the immediate bounty of his grace, he returned to his honest wife Mally with a discharge for one year's rent of the farm in his pocket."

M. DE LATOUR.

Or M. de Latour, painter to the king of France, the following amusing anecdotes are presented in the letter-press descriptions to "Kay's Edinburgh Portraits":—

"Admitted into the Royal Academy of Painting at the age of thirty-three, it was not long before he was called to court. His free and independent spirit, however, led him to refuse what most eagerly coveted. At length he submitted to the monarch's commands. The place in which Louis XV. chose to sit for his picture, was a tower surrounded with windows. 'What am I to do in this lantern?' said Latour: 'painting requires a single passage for the light.' 'I have chosen this retired place,' answered the king, 'that we may not be interrupted.' 'I did not know, sire,' replied the painter, 'that a king of France was not master of his own house.'

Louis XV. was much amused with the sallies of Latour, who sometimes carried them pretty far, as may be conceived from the following anecdote:—Being sent for to Versailles to paint the portrait of Madame de Pompadour, he answered, surlily, 'Tell Madame the Marchioness that I do not run about the town to paint.' Some friends, representing to him the impropriety of such a message, he promised to go to Versailles on a certain day, provided no one were permitted to interrupt him. On his arrival he repeated the condition, requesting leave to consider himself at home, that he might paint at his ease. This being granted, he took off his buckles, garters, and neckcloth, hung his wig upon a girandole, and put on a silk cap which he had in his pocket. In this dishabille he began his work, when presently the king entered. 'Did you not promise me, madame,' said the painter, rising and taking off his cap, 'that we should not be interrupted?' The king, laughing at his appearance and rebuke, pressed him to go on. 'It is impossible for me to obey your majesty,' answered he; 'I will return when the marchioness is alone.' With this he took up his buckles, garters, neckcloth, and perwig, and went into the next room to dress himself, muttering, as he went, that he did not like to be interrupted. The favourite of the king yielded to the painter's caprice, and the portrait was finished. It was a full length, as large as life, afterwards exhibited at the Louvre, and perhaps the greatest work of the kind ever executed.

M. de Latour painted all the royal family, and both court and city crowded to his closet. With an agreeable talent for conversation, just taste, a memory stored with extensive knowledge, and an excellent heart, he could not be destitute of friends. His house was resorted to by the most distinguished artists, philosophers, and literati, of the capital. Favoured by the sovereign, and by the heir-apparent, he was devoid of pride, and had the modesty twice to refuse the Order of St Michael.

In private, M. de Latour was a useful member of society, generous, and humane. The desire of making others happy was his predominant, or rather sole passion. Gratitude published, in spite of him, his numerous acts of benevolence, and his door was continually surrounded by the needy.

Amongst the useful establishments to which M. de Latour turned his thoughts, painting—the source of his fame, and in great measure of his fortune—particularly claimed his attention. He gave a sum (equal to four hundred guineas) to found an annual prize for the best piece of linear and aerial perspective alternately, to be adjudged by the Academy of Painting at Paris. Persuaded too of the benefits of good morals and useful arts, he founded an annual prize of twenty guineas, to be distributed by the Academy of Amiens to the most worthy action, or most useful discovery in the arts. He also founded and endowed two establishments: one for the support of indigent children—the other, an asylum for distressed age; and, at St Quentin, a free school for drawing.

Having enjoyed all the pleasures attached to celebrity in the capital, M. de Latour at length retired to the place of his nativity. His entrance into St Quentin resembled a triumph—a mark of respect to which, as the benefactor of mankind, as well as for his talents, he was justly entitled."

A SAVING OF FIVEPENCE A-DAY.

At a late meeting in Birmingham of a Total-Abstinence Society, the following statement was made by a working coach-painter, who was called on in his turn to speak on the subject of temperance. "He had made a few calculations, which he wished to communicate, with the view of showing the pecuniary benefit he had derived during the four years he had been a teetotal member. Previous to that time he had been in the practice of spending, on an average, in intoxicating drink, fivepence per day, or L.7, 12s. 1d. per annum, and which in four years would amount to L.30, 8s. 4d. He would now show how this sum had been expended during the four years he had abstained from all intoxicating drinks. First, it had enabled him to allow an aged father L.3, 5s. per an-

num towards his rent, or in the four years, L.13. Secondly, he had entered a benefit society, and paid one shilling and sevenpence per week, or L.4, 2s. 4d. per annum, or L.16, 9s. 4d. for the four years. For this payment he secured the following advantages, namely, in case of his being disabled from doing his accustomed work by illness or accident, the society will pay him eighteen shillings per week, until restored to health: in case of death, his widow or rightful heir is entitled to a bonus of L.9, besides half the amount paid into the society by the deceased up to the time of his death, with the interest due thereon. Thirdly, it left him four shillings and ninepence per annum, or nineteen shillings for the four years, to be expended in temperance publications. It might further be added, that when the sum of L.54 had been paid into the society's funds, no further payment would be required, and the contributor would be entitled to all the benefits before enumerated; medicine and medical attendance were included in the arrangement. His brother, a coach-smith, has pursued the same course for the same length of time, contributing to his aged father, and providing against a day of need.—Reader, how much may be done with fivepence a-day!

I MUST NOT LOVE.

[BY THE LATE ANDREW JOHNSTON.]

I must not love!—for envious Time
Its shoreless gulf between us throws;
As well might Lapland's snowy clime
Hold dalliance with the blushing rose.

I must not love!—for thou art fair,
And still that face but paints thy mind!
While I, disfigured by despair,
Own not one charm thy heart to bind.

I must not love!—for thou art dear,
Too dear to this impassioned heart;
No home have I thy life to cheer,
This bursting sigh proclaims, "We part!"

I must not love!—for I must toil,
Unloved, unprized, through life's scene;
My very heart's blood would recoil
To blend thy path with woes so keen.

I must not love!—for I have loved,
And felt that bitterness of fate—
To weep the loved one far removed
From life's unquenching cheerless state.

I must not love!—farewell! farewell!
Maid of my heart, my sister friend!
In vain I curb this passion-swell,
In thee I leave the world behind.

PROVOST DRUMMOND.

About seventy years ago, Provost Drummond was the chief magistrate of Edinburgh, and renowned for the benevolence of his disposition. He was one day coming into the town by the suburb called the West Port, when he saw a funeral procession leaving the door of a humble dwelling, and setting out for the churchyard. The only persons composing the funeral company were four poor-looking old men, seemingly common beggars, one at each end of a spoke, and none to relieve them; there was not a single attendant. The provost at once saw that it must be a beggar's funeral, and he therefore went forward to the old men, saying to them, "Since this poor creature now deceased has no friends to follow his remains to the grave, I will perform that melancholy office myself." He then took his place at the head of the coffin. They had not gone far till they met two gentlemen who were acquainted with the provost, and they asked him what he was doing there. He told them that he was going to the interment of a poor friendless mendicant, as he had none else to do it; so they turned and accompanied him. Others joined in the same manner, so that there was a respectable company at the grave. "Now," said the kind-hearted provost, "I will lay the old man's head in the grave," which he accordingly did, and afterwards saw the burial completed in a decent manner. When the solemnity was accomplished, he asked if the deceased had left a wife or family, and learned that he had left a wife, an old woman, in a state of perfect destitution. "Well, then, gentlemen," said the provost, addressing those around him, "we met in rather a singular manner, and we cannot part without doing something creditable for the benefit of the helpless widow; let each give a trifle, and I will take it upon me to see it administered to the best advantage." All immediately contributed some money, which made up a respectable sum, and was afterwards given in a fitting way to the poor woman; the provost also afterwards placed her in some way of doing, by which she was able to support herself without depending on public relief.

CIRCUMSTANTIAL EVIDENCE.

The Boston Mercantile Journal gives the following remarkable case of murder, and conviction of an innocent person, as illustrating the uncertainty of circumstantial evidence. The journal also employs it as an argument against capital punishment:—"A negro who had run away from his master in South Carolina, arrived in London in an American ship. Soon after he landed, he got acquainted with a poor honest laundress in Wapping, who washed his linen. This poor woman usually wore two gold rings on one of her fingers; and it was said that she had saved a little money, which induced this wretch to conceive the design of murdering her and taking her property. She was a widow, and lived in a humble dwelling with her nephew. One night her nephew came home much intoxicated, and was put to bed. The negro, who was aware of the circumstance, thought this would be a favourable opportunity for executing his bloody design. Accordingly, he climbed to the apartment of the laundress, whom he murdered—not until after a severe struggle, the noise of which awoke her drunken nephew in the adjoining room, who got up, and hastened to the rescue of his aunt. In the meantime, the villain had cut off the finger with the rings; but before he could escape, he was grappled with by the nephew, who, being a very

powerful man, though much intoxicated, very nearly overpowered him—when, by the light of the moon, which shone through the window, he discovered the complexion of the villain, whom, having seldom seen a negro, he took for the devil! The murderer then disengaged himself from the grasp of the nephew, and succeeded in making his escape through the chimney. But the nephew believed, and ever afterwards declared, that it was the devil with whom he had struggled, and who had suddenly flown into the air, and disappeared. The negro, in the course of the struggle, had besmeared the young man's shirt in many places with the blood of his victim; and this, joined with other circumstances, induced his neighbours to consider the nephew as the murderer of his aunt. He was arrested, examined, and committed to prison, though he persisted in asserting his innocence, and told his story of the midnight visitor, which appeared not only improbable, but ridiculous in the extreme. He was tried, convicted, and executed—protesting to the last his total ignorance of the murder, and throwing it wholly on his black antagonist, whom he believed to be no other than Satan. The real murderer was not suspected, and returned to America with his little booty; but after a wretched existence of ten years, on his death-bed confessed the murder, and related the particulars attending it."—*New York Mirror*.

PRECOCIOUS WIT.

A few days since, a little ragged urchin was sent by a mechanic to collect a small bill, which had just become due. He began in the usual way, but, becoming more and more importunate, at length the gentleman's patience being exhausted, he said to him, "You need not dun me so sharply—I am not going to run away at present." "I don't suppose you are," said the boy, scratching his head, "but my master is, and he wants the money."—*New Yorker*.

LIFE ASSURANCE.

Since writing the article on Life Assurance in a late number, our attention has been drawn to a number of peculiarities in the mode of effecting insurances on lives. Almost every institution, it would appear, professes to hold out some peculiar advantage to assurers, which it would be altogether endless for us to notice. It can, however, be neither invidious nor out of place for us to bring under the attention of the public a set of rules for insurance, which strikes us as being conceived in a spirit of enlarged intelligence and liberality. We here allude to those put forth by the institution called the National Loan Fund Life Assurance Society. In the event of having discontinued to pay premiums, the policy is not forfeited, but an allowance made for it to the assurer or his heirs, to the extent of two-thirds of all payments which have been made after the first five years. It also lends to assurers at any time to a similar extent, and, as far as safety to the society will admit, without guarantees; thus preventing the necessity for forfeiting the policy. To the person who falls into a state of poverty, these regulations must prove very advantageous: at all events, this society cannot boast of increasing its gains by the lapsing of insurances. Another regulation still more peculiar consists in the relaxation of the ordinary provision for depriving the heirs of assurers of all benefit in the event of the assurer having committed suicide. It being now a well-ascertained fact that suicides are in almost all cases a simple result of mental disease or insanity—not by any means premeditated acts—the usual deprivation of all benefit in such cases is, we think, to the last degree oppressive towards the unhappy family of the deceased. The institution to which we refer considerably relaxes this provision in reference to those who have been insured for a certain number of years, so that no injurious result to society can possibly take place.

SOUTH AUSTRALIA.

Having been requested, on different occasions, to present an account of SOUTH AUSTRALIA, with reference to its eligibility as a place of settlement for emigrants, we beg to state, that we do not at present possess any very distinct or peculiar information on that subject, but that, should such come into our possession, and appear to us worthy of credit, we shall lose no time in laying it before our readers.

PEOPLE'S EDITIONS.

For general information, it is respectfully stated that of the PEOPLE'S EDITIONS—a series of works in all departments of literature, established for supplying cheap books to Parish Libraries, Mechanics' Institutions, and the houses of the less affluent members of the community—the following are now published:—

PALEY'S NATURAL THEOLOGY, improved, by additional Matter and Notes	Price 1s. 6d.
MARMION, a Tale of Flodden Field. By Sir Walter Scott	10s.
LADY OF THE LAKE, a POEM. By Sir Walter Scott	9s.
THE COTTAGERS OF GLENBURNIE. By Mrs Elizabeth Hamilton	8d.
CRABBE'S PARISH REGISTER AND OTHER POEMS	6d.
FRANKLIN'S LIFE AND MISCELLANEOUS WRITINGS, greatly extended	1s. 4d.
LIFE AND TRAVELS OF MUNGO PARK (Complete). With an Account of AFRICAN DISCOVERY from the time of Park till the present day	1s. 4d.
BUTLER'S ANALOGY OF RELIGION	1s. 2d.
THE VICAR OF WAKEFIELD, by Goldsmith	8d.
ANSTER FAIR, and OTHER POEMS. By W. Tennant	8d.
ADVENTURES OF RODERICK RANDOM	1s. 8d.
ESSAYS, MORAL, ECONOMICAL, and POLITICAL. By Lord Bacon	8d.
RAMSAY'S SELECT POEMS, including his GENTLE SHEPHERD	8d.
ADVENTURES OF ROBINSON CRUSOE	1s. 8d.
THE LIFE OF ROBERT BURNS	1s. 2d.
THE POETICAL WORKS OF ROBERT BURNS	2s.
THE PROSE WORKS OF ROBERT BURNS	1s. 8d.
THE IMPRISONMENTS OF SILVIO PELLICO, a New Translation for the present edition	9d.

These works, published by W. and R. CHAMBERS, Edinburgh, are sold by all booksellers in town or country.

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and news-men.—Printed by Bradbury and Evans, Whitefriars.

BUSINESS AND LEISURE.

THE almost universal practice among men of business in England, is to devote the whole of the earlier and middle portion of life to their avocations, with the design of enjoying the latter portion in leisure. In other parts of the civilised world, a different practice prevails, namely, to mingle business and leisure throughout the whole extent of life. It would never, of course, occur to an Englishman that his plan was not the best; yet to us, like other individuals at a distance, who are in circumstances to form an unprejudiced opinion, this is not quite clear; and we think the point may not be unworthy of some discussion.

The practice of the English people is truly and thoroughly as above stated. The years of youth and middle life are devoted to business, with no intermission worthy of being spoken of as an exception. Morning, noon, and night, from one year's end to another, are closely and fully occupied. The other duties of life, which nature plainly imposes upon human beings, such as the education of the young—all these are deputed to individuals who make a business of them. The culture of any of the mental faculties besides those required for business, is never dreamt of, and, accordingly, there is scarcely, perhaps, any corresponding class of human beings on earth whose ideas are so limited as those of the great mass of business-devoted Englishmen. That this course of life is a species of slavery, is generally allowed by the individuals subject to it; but then there is the prospect of its terminating, before the decline of life, in a competency which will give the means of spending the years which remain in a complete exemption from all drudgeries. The grinding exertions, the agonising anxieties, the dreary monotony of the present, is cheerfully endured, in the hope of a future which will make up for it all in an indefinite period of gentlemanly leisure, quiet, and enjoyment.

We are not prepared to say what proportion of the whole number attain the object of their wishes. Certainly, the desired competency and the consequent relaxation are secured in many instances, yet not perhaps in one out of twenty, the other individuals sinking under the severity of their toils, or through the other accidents of life, or else being obliged to work on into old age for the sake of mere current subsistence. And what is usually the condition of the enviable few who have been successful? The fictitious literature of a century past would answer this question by holding up its numerous examples of retired citizens vainly seeking in frivolous amusements and hobbies, the means of agreeably whiling away their time, until at length, unable any longer to endure a vacuity for which they were unprepared, they found it necessary to return to their former business, if not intercepted by a death of sheer ennui. Perhaps these pictures are a little overdrawn, or do not represent the bulk of the class of retired men of business; but there can be no doubt of the general fact, that the leisure period, when it comes, is invariably more or less disappointing. It could not, we believe, be otherwise, for there are natural principles in the case which admit of no other result. Any kind of life, however unconformable to nature, which has been persisted in for many years, becomes, by virtue of that continuance, a matter of habit, and cannot be changed without a shock to the whole system. Besides, the mind is totally unprepared for the enjoyment of leisure. It has acquired none of the tastes which, in the case of those who never had to yield to the yoke of business, make leisure only an opportunity for enjoyment. The contemplation of natural objects, reading, rural pursuit, such as gardening, have no charm for such a mind, or seem to it

as mere trifling, and, if tried, are immediately thrown aside. Life having now no aim, and time no cheering occupation, the retired citizen becomes the victim of melancholy, and ends, like the Hebrew sage, in declaring all to be vanity and vexation of spirit. No doubt, life may well appear such to a person in his circumstances, for its energies have from the very first been directed in such a way that no other consequence could ensue. He has concentrated, on one object, talents and feelings for which nature has furnished a thousand that are equally fitting. He has made that the grand aim and end of his being which was intended only to be a means by which his being might be supported while he was following more noble pursuits. The natural and unavoidable consequence is, that life will appear to him in the long-run as only a disappointing dream.

The continental mode of life is greatly different. There business is rarely an engrossing or exclusive pursuit. The Frenchman spends half of his life in public places; the life of the Italian is quarter business, three quarters fête; the German meditates for hours every day over his pipe. The leisure of life is thus enjoyed in daily instalments, instead of being reserved for one large but imaginary *bonne bouche*, or sweet mouthful, at last. We will not say that any of these nations devote such shares of their time to business and leisure respectively, as are strictly rational: much less do we think that they employ their leisure in the best possible way. But, certainly, in their general plan of distributing leisure in small portions over the whole extent of life, they are more conformable to nature than we. The periods of repose called for by the muscular system, are obviously short and frequent. It would never do for a labourer to attempt to work incessantly for one week, and rest all the next. He only can work efficiently for a few hours at a time, after which he requires a short interval of rest. When that interval is past, he can renew his exertions with the same vigour as at first; and so on. Now, the man of business, although he may not exert his muscular system in any great degree, is under exactly the same regulations as the ordinary labourer. The nervous system, which he chiefly exerts in his calling, also requires frequent alternations of labour and rest. Let intervals of rest be given, and he renews his exertions with the full amount of his natural vigour. Let these be denied, and he wears himself out as effectually as the labourer would do if he were not to make the necessary pauses in his task. The operation of these principles may be readily traced in our ordinary sensations. Every one must have experienced the languor consequent on too long protracted mental exertion, and the briskness with which business is resumed after rest. We may thus read, as it were in nature's own book, the law by which she designs us to be regulated. It is clearly inconsistent with this law that youth and middle age should be spent in one paroxysm of extreme activity, and the elderly period, if an elderly period be vouchsafed, in a fit of luxurious indolence. It would be almost as wise to attempt to eat at one meal the food required for a couple of days, or to think that by a sleep of thirty hours we should be the better enabled thereafter to endure some extraordinary fatigue.

This is to limit the question merely to a consideration of the most natural way of distributing leisure. The subject may be considered in still more important points of view. It is not merely a question of how much time shall be given to business and how much to relaxation, but how shall the faculties of our nature be employed in such a manner as to make life upon the whole agreeable, and fulfil the great ends of our

being. The faculties brought into exercise in the affairs of ordinary business, are not the only faculties we have, nor the best. We have other faculties which may be employed to far higher purposes, and which may consequently bring us far higher enjoyments. Without attempting to specify the whole of these purposes or enjoyments, we would say that, at least, every human being should be to a certain extent a contemplative and reflecting creature, studious of the many phases in which the physical and moral worlds display themselves, feeling tenderly the sympathies towards his kind, and deeply the relations towards the unseen Supreme and Future. Thus his whole nature would receive employment; all would be cultivated; a harmony would exist in the various parts and employments; and when age came on, man would feel that the world, instead of being an unprofitable delusion, had been a scene in which a certain instrument had played a certain proper part, and been participant accordingly of certain proper enjoyments, so that its natural design had been fulfilled so far, and it was now ready to be transferred to the new scene of being all along reserved for it, and for which its existence hitherto had been a suitable preparative. When we consider that the course of life first described necessarily and absolutely precludes the possibility of this entire and harmonious cultivation of our nature, and necessarily precludes these results, we can be at no loss to pronounce it wrong. The thoughtless half vacant life of the continental European may be as far as the busy life of the Englishman from the philosophical mode here pointed out; but certainly, while it is, in the very first place, and upon the lowest consideration, more likely to give health and length of days, it is also necessary as a step to the attainment of the better mode which we have in view.

We well know what will be said of these speculations by those whose mode of life is not approved of. It will be allowed that they are all very well in theory, but that existing necessities are such as to make their realisation in practice impossible. Englishmen, it will be said, have got into an artificial state, which renders incessant toil the doom of all who would live. Individuals are helpless; for if they intermit the least in their struggles for a living, their neighbours take advantage of the circumstance, and thrust them aside. Ideas of this kind are apt, we suspect, to be merely imaginary. Men dream of necessities which they think themselves liable to, when they are only enthralled by their own inclinations. Thus, we conceive, it is only the powerful thirst of gain, or an undue ambition for superior rank and consideration, which operates on most minds to induce a supposition that extreme toil is unavoidable. If this be the case, it becomes purely a question of comparative advantages, and men are only required to choose whether they will have, with the chance of wealth, a life of unintermitted exertion, tending to injure health, and make the human being only a fraction of what he ought to be, or a mode of existence such as has been described as that for which we are designed by nature, wherein, while industry and its objects are not neglected, there is a full range of intellectual and sentimental pleasures, making the present a kind of heaven, and preparing a better heaven for the future.

Even admitting that there are circumstances in the general condition of our country which condemn its people to extra labour, it must be for good that the non-conformity of that extra labour with nature's institutions is pointed out. We can consider no doom of this kind as irreversible. The nature of man is such, that it is impossible for him long to be convinced of the existence of an evil, without endeavouring to remedy

LIBRARY U.C. RIVERSIDE

It. Already, the evil in question is to a certain extent perceived and acknowledged; and already men, in large numbers, are forming the wish for shorter periods of daily business and labour. The necessity of amusement is also beginning to be acknowledged as a principle, and acted upon accordingly, under moral guidance, instead of being left, as formerly, to chance: this we consider as in itself a great step towards a natural mode of life. Let but the influences now at work experience no check, and no misdirection, and we have no doubt that in a very few years there will be such a progress towards that object, as will cause men to look back with astonishment to the habits, both mercantile and domestic, which now exist.

A STORY OF THE FRENCH REVOLUTION.

BY THE OLD SAILOR, AUTHOR OF "TOUGH YARNS," ETC.

"Till then I banish thee, on pain of death."

King Henry IV.

THE period of my narrative is the year 1797, and the opening scene is in the city of Paris. The parties in the French Directory were at daggers' points; and notwithstanding the efforts of Madame de Staël to bring about a reconciliation, the Constitutionalists refused to swear fealty to regicide supremacy, or to acknowledge a power formed exclusively from the most sanguinary faction of the Revolution. The great dependence of the Terrorists was upon the army, under Generals Hoche and Bonaparte, who contemplated a *coup d'état* to overwhelm the Girondists, who, though in a great measure sensible that danger was hanging its dark clouds over them, yet knew not from what quarter the thunder would burst, and felt themselves unable to shun or counteract it when the storm should roll its overwhelming force to destroy them.

It was on the evening of the 15th of September, and Madame Michaud sat with her husband in a parlour of their house, which commanded a view of the Boulevards. The evening was rather sultry; there was but little wind; the sun was hastening down to the verge of the western horizon, mantled in his richest splendour of gold, and purple, and vermilion. Martial music filled the air, for the morrow was to present a grand review to the citizens of Paris, and the troops under Augereau were marching into the capital to take up their positions.

"How delightfully those strains come upon the ear!" said Madame to her devoted and attached husband, as he stood gazing with emotion upon the beautiful woman. "I dearly love at all times to listen to the soul-inspiring harmony of music, but never more so than when the swell of a full military band breaks the silence of approaching twilight. Hark!" she continued; "and yet it makes one shudder to think that such heavenly sounds should herald the messengers of warfare and blood."

Michaud started, and a paleness overspread his cheeks. "It is but too true, Eulalie," said he, mournfully; "they are indeed the agents of death. And perhaps even now—" he added hastily, but instantly checked himself, and paced to and fro in the apartment.

"You appear to be disturbed, my dear," uttered the lady, rising, and throwing her finely moulded white arms round his neck. "Surely I could have said nothing to displease you."

"You! Eulalie! Oh no!" responded the husband; "you have ever been a treasure to me, and had I followed your counsel—but it is too late now. But come what may, I must meet it as a brave man ought."

"What do you apprehend, Michaud?" inquired the lady, labouring under painful alarm. "Do you suspect the troops? I cannot think that any evil is intended. It would be a death-blow to the liberty the councils have struggled through seas of gore to attain. It will be but a show to please us women. Hark! can any thing sanguinary be connected with such exquisite music?"

"I may be mistaken, my love," replied the husband, endeavouring to assume a composure he was far from feeling, for Pierre Michaud was a Constitutionalist and a national representative, against whom the vengeance of the opposing party would be unsparingly levelled, and he had looked upon the expected review as a mere subterfuge to get possession of the capital. He would not, however, terrify a mind that he felt it was his duty, as well as his affectionate inclination, to soothe and tranquillise; therefore he concealed the presentiments of evil that had seized upon his mental faculties, so as greatly to depress his usual flow of animation, and forced nature into a burst of hilarity foreign to his heart.

That night the faithful and attached pair sat till near morning holding sweet converse, and enjoying that delightful communion which flows from purity of affection. It was a night of exquisite gratification, and in the stillness of the hour did the eloquent Michaud pour forth, in energetic language, his ardent and faithful love for his wife: he seemed as if inspired; there was an unusual glow of feeling in his breast that he himself could not account for; a heavy weight hung upon his mind, and seemed to force out the ardour of his soul in beautiful and energetic language, and Madame Michaud was happy.

Suddenly the heavy report of a cannon came booming through the silence of midnight; the deputies started;

he caught his wife to his arms, and clasped her to him with a fervour and strength which seemed to say, "They shall not part us." For several minutes a death-like stillness prevailed; neither of them scarcely breathed; but the discharge was not repeated, for the sound of a single unshotted gun had annihilated the French republic. Augereau had surrounded the Tuilleries—the guard surrendered—the place was taken possession of—several members of the Five Hundred were arrested, and conveyed to the Temple, that prison to which many of them had been instrumental in consigning the unfortunate Louis—and the army was triumphant. But Pierre Michaud knew nothing of all this; and the next morning, after a most tender parting with his lovely wife, he repaired to the hall of sitting, was apprehended on his entrance, and sent to join his companions in the very apartments which had been occupied by the royal martyr and his devoted queen. Some of the prisoners had been in the Convention, and had given their votes for the death of their sovereign; and now the wheel had nearly performed its revolution—the period of blood had approximated to its cycle—they knew and felt themselves to be victims appointed to die. Oh! could it have been possible to enter into the secret recesses of their hearts, and witness what was passing there, when retributive justice unbared her arm, and demanded "as they had meted out to others, so should it be measured back to them again." But, in this instance, the guillotine was not resorted to; there was a cruelty in the mercy that condemned the prisoners to perpetual banishment to Cayenne. Michaud was not even allowed the mockery of a trial; and without any attention to his prayers and entreaties to give one last embrace to his beloved and almost heart-broken wife, he was hurried to Brest, and embarked, with many others, on board a frigate bound across the Atlantic. The ship remained but a few days in port; orders came for her sailing; the wind was fair, her anchors were weighed, and she stood out to sea. There is a feeling connected with the departure from our native shore that operates even upon the roughest nature. The bold land which, when near, seems to lift its head with daring pride from the depths of the ocean, sinks lower and lower as the vessel recedes; and to the uninitiated in this deception, the ship appears to be stationary, and the land departing. It was this that made Michaud exclaim, in the extreme of his agony, "The land is leaving me—beloved of my heart, I shall see thee no more!" Each believed the separation was eternal. The God of Nature and of Providence has implanted in the human heart a veneration for the place of nativity—an attachment to the soil on which we first drew our breath. Men may affect philosophy; they may call themselves "citizens of the world;" but, oh! even the most crude and callous cannot resist the appeal which is made to the kinder emotions by the mention of the word "HOME." And here were individuals banished from their home, and all that endeared them to existence; here were individuals bidding farewell to their native land—a long, an eternal farewell; here were parents, brothers, all the male ties of relationship, torn from those loved ones whom they could never hope to see again. Nor were these the poor, the destitute, or the outlawed felon—many of them had inhabited palaces, and lived in splendour; there were the once wealthy and highly privileged noblesse; there were the ministers of religion, the learned scholar, and the devoted patriot; but there were also the sanguinary regicides who had consigned their monarch to a public execution, and had been present at the scaffold to witness his last sufferings. Recollections of such a spectacle were not calculated to alleviate misery.

Pierre Michaud was about twenty-seven years of age, possessed of a very fair estate, and fairer prospects, when he contracted marriage with a lady whom he long had loved. They had only been united a short time, when he found himself dragged into the vortex of the Revolution, by being chosen one of the deputies for the south of France. To have declined, would have been tantamount to rendering himself suspected; and having a liberal bias towards a constitutional form of government, he repaired to Paris, accompanied by his young wife. His only crime in the eyes of the Terrorists was his being a Constitutionalist. Had he been permitted to choose, he would have retired from the revolting scenes that shocked his spirit, to homely peace and love. He was no regicide. He loved his country, and ardently longed to see the wolves that preyed upon it destroyed. Yet Pierre Michaud was a banished man.

And what had become of his attached wife? After parting with her husband, she employed herself in such little offices as she knew would gratify him, and win a smile and embrace on his return to take her to the review. Martial music was once more filling the air with its thrilling swells; but there came a sound mingling with it that brought the chilliness of fear. There is no other sound like it in creation. It proceeds from the voices of assembled thousands, uttering wild but simultaneous shouts of revolutionary vengeance. I have heard those rolling shouts in different parts of the world, when all that is human has been laid aside, and all that is infernal reigned paramount in savages, and the cry has been the same, though dissimilar in language. Eulalie had not been habituated to those fearful explosions of brutal passion, when the yells of multitudes roll upon the breeze; but a shuddering instinct crept through her frame, as mingled with the pealings of the trumpets, she heard the sounds, more like the dying groans of a prostrate

army, than the triumphant cheers of conquering victors. She listened with an indefinable sensation that she could not account for: never had any sounds which she had heard, produced such strange and appalling effects. They evidently grew louder, and indicated a nearer approach to her dwelling. A presage of some calamity, but of what nature she knew not, darkened her mind, and caused a tremor to shake her frame. Suddenly a friend of her husband rushed frantically into the room. "Fly, fly, Madame!" he hurriedly exclaimed; "fly whilst there is yet hope of escape. The blood-hounds are coming to wreak their fury. Hark to their advent!"

"And Pierre! what has become of him!—where is my husband?" inquired Madame Michaud, rallying all her energies to meet the approaching danger.

"There is no time for converse now," returned the person addressed. "Pierre is a prisoner, and well needs your best exertions to support him in his adversity."

"And he shall have them," responded the lady, with firmness. "This is his house and his property, and I will not abandon it to strangers."

"You will defeat your own purposes," uttered the man; "if you remain, you perish, and the prospect of saving your husband lost. Hark! they are close at hand, and even now it may be too late. A fiacre awaits. Slip on your bonnet and shawl. Hieed no other dress, and hasten, for your life."

Thus solemnly warned, Madame Michaud complied. The fiacre was gained, and drove off. The mob assailed the dwelling; the work of demolition commenced; and in one short hour, the place presented a scene of revolutionary ruffianism and wreck. The unfortunate lady, though she had saved her life, could not obtain a refuge. She was a woman of talent and integrity, two dangerous qualities to the regicidal faction; and, consequently, she was proscribed, and driven into obscurity, at the very period that her husband was quitting Brest harbour for the colony of Cayenne.

Away flew the ship over the foaming waves, bearing within, hearts sad, and stricken, and despairing—consciences, over which a sense of crime was exercising a despotic sway—blood-guiltiness, that left a stain upon the immortal soul—groans, and complaints, and cries, mingling with the clanking of chains, and the ringing of fetters, came up the hatchways, and were wasted on the desert waters. Yet the sun by day, and the stars by night, shone bright and clear. The heavens wore a smiling and a cheerful aspect, and none who saw that gallant vessel proudly stemming the billows, could have conjectured that she carried a freight of such appalling misery. The dreaded Bay of Biscay was crossed in pleasant weather, and Cape Ortegal appeared. It was opening daylight when they made the dark blue land arising from the azure ocean, and a few minutes afterwards a strange sail was visible from the deck. Glasses and straining eyes were directed towards the object; many a conjecture was hazarded; many a gasconade was uttered; but none, though several were well assured of the fact, declared her to be what she actually was—a British frigate, full of eager spirits to engage. Being under the land, she had the advantage of the Frenchman in seeing the enemy first; and, when discovered, was already crowded with canvas, in chase. But the French captain was fully acquainted with the admirable qualities of his noble ship. She was one of the fastest sailers in the republican navy, and carried her broadcloth with the stiffness of an alderman. Nor was the British frigate any way inferior, either in fleetness or stability; and from the moment of interview at daybreak, till the twilight hour of evening, when sombre shades were gradually deepening into night, no perceptible change had taken place in their relative positions. Oh, what anxious moments were these for the wretched prisoners in the hold! They would be content to remain captives, if taken; but then it would be in England, where the hand of the oppressor could not reach them.

Sometimes, during the day, the bold bulwark of St George, by various manoeuvres, contrived to draw upon the democratic citizens; but the French captain was a seaman, and by cutting away his anchors, and retreating his ship, was again enabled to walk ahead; and as they were not within reach of shot, no actual hostility had occurred. Anxious and earnest were the gazers during the whole of that night; and though sometimes, when a haze was on the horizon, it was hoped by the French captain that he had escaped from his pursuer, yet no sooner did the mistiness evaporate into thin air, than the indefatigable and watchful enemy was once more visible, and carrying on to come up with the chase. During the darkness, the British frigate had thrown up rockets, burnt blue lights, and fired guns, to attract the attention of any friendly cruiser; and when daylight again dawned upon the waters, another large frigate was seen nearly abreast of the Frenchman, and about two miles distant. At first she was standing towards the republican, but the superior sailing of the latter plainly evidenced that there was no chance of nearing the French ship but by running on a parallel line, and occasionally hauling up, for the Englishman was to leeward. An engagement now appeared inevitable; but the French captain dexterously avoided it, by changing his course two points to windward; and though a few shots were exchanged, yet but trifling injury was done on either side. For four days and three nights did this chase continue; the British sometimes bringing up a fresh of wind, and getting within gun-shot, and then the French frigate would

catch the breeze, and again outsail them. The fourth night a heavy gale of wind came on, that continued for nearly a week. The furious elements, though they did not calm the passions of the hostile parties towards each other, yet drew all their attention to their own peculiar safety, and the ships parted to meet no more.

Nothing scarcely could exceed the horrible situation of the state-prisoners during the storm. From their countrymen they suffered the utmost indignity and inhumanity. Several of them perished in that loathsome and pestilential hold; and eight or ten having held a solemn council, frenziedly determined on self-destruction.

At length the frigate arrived at Cayenne. The appearance of the island in its rich fertility was beautiful, and the verdure presented a grateful spectacle to the eyes of the wretched captives. But on landing, the intense heat of the climate almost overpowered them, and sickly apprehension aided the attacks of fever that speedily diminished their numbers. They were placed in a coffee logie as a temporary prison, and provisions of the worst quality were served out to them in very scanty allowances, and they were kept under extremely rigid restrictions.

Pierre Michaud, although the bitterest anguish oppressed him when he thought of his home and his wife, yet struggled with his afflictions, and, like many others, determined upon attempting to escape. It is true that several had lost their lives in their endeavours to reach Surinam or Berbice, or to penetrate into the interior to the Spanish settlements of Paraguay. Some, in fact, after almost incredible hardships, succeeded in getting to Pernambuco. Michaud at length was enabled, through the generous aid of a Swedish gentleman, a planter, who was about to embark in an American brig for the purpose of conducting a sick wife to Europe, to obtain concealment in the same vessel. The brig was bound to Gottenburg; and oh! the delight that swelled in the heart of the banished man when they gained the mouth of the river, and were rapidly running off from the land. The very air, as it came laden with the perfumes from the orange blossoms, was now the breath of liberty to him, and hope resumed its wonted hold upon his mind; he was free, free, and he felt in his whole frame the expansive powers with which emancipation had blessed him.

"Oh, blest liberty! it is thou alone
That gives to fleeting life its sweetness and perfume,
And we are slaves without it!"

The winds were fair, the weather favourable, and the captain promised a speedy passage. Monsieur Berthollon had laid in his own provisions for himself, his wife, his daughter, and his friend; and trusting to the assurances of the captain, who was poorly supplied, they lived merrily and unsparingly upon their stock, which was daily decreasing. It was the month of December when the brig neared the British isles, intending to run through the English Channel. But north-easterly gales set in; the cold became piercing; and, to their dismay, they discovered that there was even, upon the most economical scale, not more than a week's victuals remaining, and a very scanty supply of water. Day after day passed on, and still those hard-hearted winds prevailed. Gradually the food disappeared, till their only nourishment consisted of a single biscuit, about a quarter of a pound of salt pork, and one glass of water, for twenty-four hours. The sails were several of them split; the brig being deep in the water, the sea broke fearfully over her, and at length she became leaky, so as to keep the half-famished and nearly worn-out crew incessantly at the pumps. But the thrilling dread of starvation overcame the horrors of prospective shipwreck; scarcely a morsel of nourishment was left; the water, except a very small portion, which, to the eternal honour of the seamen, was preserved for the females, was gone, and death stared them in the face with that gaunt and terrifying look which ravening hunger and parching thirst create. The captain of the brig proved inadequate to his duty; by his soundings he discovered that he was considerably out in his longitude; and when emergency demanded prompt activity and exertion, terror overcame him, and he shrunk back dismayed, confining himself to his cabin under pretence of illness, which, however, was not long before it came in reality.

It was a pitiable spectacle to witness the despairing countenances of those unhappy creatures, whose hollow cheeks soon betrayed the urgent wants of nature, and whose wolfish eyes glared wildly upon each other as unbidden longings arose that made them sick to shuddering. Every means had been resorted to that human invention could suggest to prolong existence, but the last resource was failing. No vessel appeared in sight; the gates of heaven seemed to be closed to their earnest supplications, and despair triumphed over even the consolations of religion. And there sat the father gazing with tender anxiety, verging upon agony, at his wife and child, but with his tenderness there came also a mingling of ferocity that he could not subdue. The demon hunger was preying upon his vitals, and the corroding tooth of the monster poisoned the source of generous feelings. Madame Berthollon possessed a most kind and indulgent husband; disease had made her petulant, but impatience and repining were swallowed up in the prospect of the dreadful death which awaited them, and the affliction of the wife and the mother raised her above the ebullitions of corporeal

suffering. The incessant breaches made by the sea kept them constantly wet; their bedding, every thing was saturated with water; whilst, to add to their misery, they had seventeen hours of darkness to seven of light.

In time, the gale suddenly shifted to the west-north-west, and bore them along with great rapidity towards England. Hope once more revived, that, though they might not reach a friendly port, yet, getting in the fair-way of the Channel, there was a chance of falling in with a vessel from which they could obtain assistance. A day and a night passed away, and still they were careering onward without having been able to speak one ship, although several had been in sight. Disappointment increased their irritability; there was a maddening unnatural savageness in all that the crew did; they wrangled, they fought, without knowing why or wherefore; and there was a tiger-like desire to gratify their appetites with flesh. A little negro lad, belonging to Monsieur Berthollon, disappeared; it was reported he had been washed overboard, and one or two asserted that they had seen him struggling for his life. It might be true, but the men had food; where they procured it, none would tell; but conjecture was not long in deciding as to what the horrible banquet actually was, and many partook without questioning further. At the close of the second day, the wind veered round more to the northward, and increased in fury so as to compel them to lay to, and before its close the land was dimly seen, through the dense haze, dead under their lee. Where they were, whether on the coast of Ireland, England, or France, no one could tell. They had not been able to obtain a meridian altitude for ten days; the reckoning had been wholly neglected; and though to the passengers the land presented a prospect of safety, yet to the seamen it threatened wreck and death. A long dark dreary night was before them; there was the blackness of darkness above, there was the blackness of darkness below, and the gloom of the sky and ocean were united by links of white sparkling foam. The water gained so fast upon the brig that she was nearly unmanageable; the billows threw their lofty feathery heads clear over her, washing every thing from the decks.

About two o'clock in the morning, a tremendous shock told them of their fate; the brig had struck the ground, and shook and trembled as in agony. She was lifted on the curling summit of a mountain breaker, borne along with irresistible velocity; and then, as she descended, was dashed upon the rocks, that rent her stout timbers, already shattered by the gales. The crew and passengers had crowded on the deck, grasping any thing that promised security; but their hands were benumbed by the cold, and the relentless billows washed them away into the yawning abyss, or crushed them on the craggy rock on which the brig was heaving with convulsive throes. Again rolled in a mountain wave, roaring and raging in the power of its might, the remnant of the wreck was hove farther in and fixed, where, though the sea was not so violent, it still beat incessantly over them in showers of spray. At the first shock, Monsieur Berthollon, aided by his friend Michaud, succeeded in lashing the mother and daughter to the stanchions of the winch near the mainmast. Berthollon was performing the same office for himself; his wife and child clung to him so as to impede his labours. Alas! the second wave tore him from their grasp. He caught a rope, but it was not fast. Wild shrieks mingled with the howling of the gale, as the dark form of the wretched father was seen whirling along amidst the hoary foam, and then disappeared for ever. Pierre Michaud beheld the catastrophe, but he could not avert it. He had been with difficulty enabled to make himself fast near the ladies; and futile as his attempts were likely to be to soothe them under affliction, he could not refrain from offering consolatory kindness. But their hearts were bereaved and desolate; the voice of the comforter—oh, it was almost a mockery to think of comfort then—was borne away upon the wild gushes of the gale; and exhausted by fatigue and faintness, Pierre found his strength, both mental and physical, forsaking him. A benumbing heaviness crept over his faculties, and he conjectured that he was approaching the termination of his earthly career. His eyes became dim, his recollection faded, he sank into insensibility.

The east had opened her portals, and daylight, in mournful array, had gloomily issued forth, when Pierre Michaud, stiffened with cold, and scarcely alive, awoke to a consciousness of his awful situation. He shook with convulsive agitation that portended the last struggles against dissolution; he felt his end was near at hand. And what was the spectacle which he beheld? The brig had fallen over nearly on her broadside, and he was in some measure suspended by his lashings. At his side were the mother and the daughter clasped in each other's arms; the former with her head thrown back and her eyes fixed and glaring, the latter with her face upon that bosom from which she had drawn her nutriment in early infancy; both were dead! At his feet, in the waste of the water, were two seamen, whose only motion arose from the fluctuation of the waves; they were past suffering. On his left hand, a little below the shattered bulwark, lay the captain on his back; but though the sea was breaking over him, he made no movement, for he too was lifeless. The shore, a wild rocky coast, could be faintly discerned; but as the gale still exulted in its devastating strength, Michaud dared not cherish a single hope

He resigned himself to his fate; a stupor came over him, and he was lost to consciousness.

Once more the banished man awoke to sensibility; but oh, what a change was presented! There was no longer the howling of the tempest and the bellowing of the waters; there was no longer death and destruction stalking in fearful array around him; he lay upon a soft bed, under warm coverings; his pillows had been carefully arranged beneath his head, and the curtains were closely drawn to exclude the cold air. "Where am I?" exclaimed the bewildered man, as with difficulty he raised himself up, and, having parted the curtains, gazed with astonishment at the scene. "Father of mercies!" he exclaimed, "has it then been only a dream! Eulalie—my own Eulalie!" for she was sitting by his side, "what is all this? Oh, there is too much of horrible reality in the remembrances that crowd upon my mind!—am I yet living? Come, come to my arms, thou partner of my joys and sorrows, and by your fond embraces convince me that this is no deception."

Madame Michaud passed her arms around her husband's neck, kissed his pallid lips, and shed tears of joy upon his breast. "Yes, Pierre," said she, "thus wonderfully restored to me and to your home—blessed be his holy name who has wrought out this deliverance."

"I see—I see," exclaimed Pierre delightedly; "we are in my own ancestral mansion. In this room I drew the first breath of existence; and here, Eulalie," continued he, as he pressed her to his heart, "here am I restored to a second life. But how has this astonishing event been brought about?"

Madame Michaud briefly informed him of the wreck being observed on the coast near to his own dwelling, and himself, with three or four others, rescued from impending death. Notwithstanding his emaciated appearance, he was recognised by many who had known him in brighter days, and the papers found upon his person corroborated the evidence of his identity. He was promptly removed, and assiduously attended to by his devoted wife, who, after undergoing severe hardships and cruelties, had been restored to her matrimonial rights.

"But the Directory," exclaimed Michaud; "my enemies, Eulalie; will they not discover where I am, and continue to persecute?"

"The Directory is no more, Pierre," responded his wife; "the monsters have been shorn of their power. Napoleon Bonaparte effected a revolution on the 18th Brumaire, and is now Chief Consul. It is through him that I am here—and you, oh, my husband!—you are no longer a banished man."

Pierre withdrew from public life, and cultivated his estates; and it is but a few years since I plucked delicious grapes in his vineyard, and saw him surrounded by a numerous and noble progeny, on whose minds he had inculcated one excellent and wholesome lesson, that may be summed up in two words—NEVER DESPAIR.

SINGULAR MODE OF TENANTING LAND IN GUERNSEY.

THE island of Guernsey, situated on the coast of France, but belonging to Great Britain, has a surface of twenty-four square miles, or 15,360 acres, two thirds of which only are capable of cultivation, and yet it contains 24,349 of population, being at the unexampled rate of a thousand to the square mile, or more than three times the ratio of Belgium, which is usually represented as the most densely peopled country in the world. Making every allowance for a busy town, which draws support from commerce and from fishing, and contains 1476 inhabited houses, the population of Guernsey, as a small piece of agricultural territory, must still be considered as a singular phenomenon—one of which it is well worth while to inquire into the causes. A writer, resident in the island, has an interesting paper on this subject in a late number of Tait's Edinburgh Magazine, from which it would appear that the chief if not sole cause of the extraordinary populousness of the rural part of Guernsey, is a mode of occupying land peculiar to this part of the British dominions, and to some of the neighbouring islands. It is, we believe, the ancient Norman mode of land-teaure, or something little different from it, and its practice in Guernsey is of many centuries' standing.

The letting of land by a landlord to a tenant is unknown in this island. When a proprietor chooses to depute the cultivation of his ground, or, as the phrase goes in Guernsey, to give it to rent, he submits it to a species of sale, or what, at least, would be considered as a sale in this country. All land is considered as divided into lots called quarters, a quarter being equivalent to twenty pounds of Guernsey currency. Suppose that A possesses land to the value of twelve hundred pounds, or sixty quarters, and wishes to dispose of it to B, he conveys it to that individual, either without receiving any cash, or receiving (which is the more common case) one-fourth of the value in hand. If no cash has been paid, A receives interest at five per cent. for the whole L.1200, namely, sixty pounds per annum, which may be considered as the rent; or if a fourth of the purchase money has been advanced,

he receives only L.45, being the interest of the portion allowed to rest with the purchaser. "The reason," says our authority, "why it is usual to pay one-fourth part of the purchase money in cash is, that such payment may be some guarantee to A that B will faithfully work the estate, and pay his rent regularly; for, should the rent fall in arrear, then A, by a process called *saisie*, may totally eject B from the property, and the three hundred pounds paid by B when the contract was passed would be lost to him for ever. In this manner, then, is the seller or landlord secured in the receipt of the equivalent for which he has parted with the estate."

As soon as the contract between the parties is executed, B becomes, to all intents and purposes, absolute proprietor of the soil; and so long as he pays his quarters, he can never be evicted; nay, more, he can fell timber, convert meadow into arable, and arable into meadow, and perform any and every act that a tenant in fee-simple can do in England. The estate, thus acquired, descends to the heirs of the purchaser, and, on failure of direct issue, to his nearest of kin. Sometimes these annual quarters are made permanent, but most frequently they are redeemable by certain instalments, as the buyer and seller may have agreed."

The descent of these tenant-properties, as we may call them, is not regulated by the law of primogeniture; neither is it quite free of this law, but appears to be conducted upon a sort of medium between the evils on both sides. "The eldest son takes the principal house, and from sixteen to twenty perches of land, on which the outbuildings may be supposed to stand; this the law gives him exclusively, and he also has the right to keep all the land attached to the house in a ring fence, and not separated from it by a public road; but whatever he takes over and above the sixteen to twenty perches, he must account for it to his brothers and sisters, by paying them the value of this excess in money. By this plan the estates in Guernsey are never so subdivided as to produce inconvenience, nor are they ever so consolidated as to produce injustice."

A great subdivision and a very thorough cultivation of the land have been the consequences of this system. "The estates," says our author, "are small, none exceeding seventy acres; and the average amount of land attached to each house in the country, may be computed at five English acres. This minute subdivision causes the whole island to be cultivated as a garden; not an inch of available soil is lost, and even the hedges are planted with furze for winter fuel. The crops are abundant, and far exceed those of England. The average produce of wheat per acre is thirty-three Winchester bushels, and as much as fifty-five to sixty have been raised. Five hundred bushels of potatoes per acre are the ordinary produce, and the hay crops average three tons and a half, English weight. Twenty-two tons of parsnips per acre are considered a fair crop: 2500 milch cows are kept, yielding an annual revenue, in milk and butter, of L.32,520; 550 cows are annually exported to England, and the same number of cattle slaughtered for home consumption. Vegetables, fruit, poultry, eggs, and cider, are most abundant, and of excellent quality. Now, the question, the commercial question, arising out of these facts, is simply this: Where, in Great Britain or Ireland, can be found 10,000 acres equally productive? Let it not be said that the islands have richer land, a more favourable climate, or better implements of husbandry; this is not the fact: they have, moreover, many disadvantages, as tremendous gales of wind in winter, and scorching droughts in summer; but they have one paramount superiority, and that is their system of landed tenure—the true source of their agricultural wealth."

The rent of land in Guernsey, expressed in English terms, is never less than five pounds per English acre; and it is a very rare case indeed, if it ever falls in arrear. The landlord is seldom disappointed in the regular receipt of his income. * * * We shall now proceed to the moral influence produced on the people by this system of tenure. One of its first consequences is to raise the standard of virtue—to inspire the whole population with a manly and independent spirit—and to destroy that cringing adulation and fawning servility, which leases for years have necessarily engendered among the tenantry of England. All men have admitted that the institution of property is the basis of civilisation. This principle being acknowledged sound by universal consent, it follows that whatever counteracts its expansion must be vicious, and that whatever promotes its extension must be nationally beneficial. The bare possession of property on a doubtful tenure is scarcely a good: it is essential that the possession should be secure; and if security for a term of years be desirable, much more so must it be for permanent enjoyment. Now, the plan of leases for seven, fourteen, or twenty-one years, together with tenancies from year to year or at will, is bad in principle, as they merely convey a temporary interest determinable at a date specified; the working farmer thus becomes a bird of passage, without any fixed home. He may be prudent, industrious, and sober—a good father, a good husband, a good master, a good neighbour, and a good citizen; but these virtues avail him nothing; he lives in a state of agricultural servitude, and, at the expiration of his lease, the caprice or spite of his landlord may expel him from his farm. Far different is the condition of the Guernsman. Once possessed of land, he can

never lose it, except by his own fault; he has only to pay the stipulated quarters of rent, and he continues absolute lord of the property; he feels proud of his position, and the spirit of independence is within him; he has a solid stake in the country, though it may be small; he can say with honest pride, 'This house is mine; that field is mine; and when I die, the law will give them to my children.'

This system of tenure prompts to industry, encourages economy, and represses intemperance. A man having paid down in cash one-fourth of the value of the land he holds, is stimulated by the most powerful impulse to redeem the annual quarters, and disengage his estate from the payment of rent. In the eyes of a person so circumstanced, labour loses its repulsive character, for he feels that he is working for himself. He has an object constantly before his mind which he steadily pursues. The propensity to drunkenness, so fatal to the working-classes of Great Britain, is counteracted with the Guernsman by the desire and the opportunity of acquiring a disencumbered landed property. * * * We may with truth affirm that habits of prudence, economy, moral restraint, and the wisdom of appreciating in what consists a competency, and the disposition to live within one's income, are virtues indigenous to the soil of Guernsey, and rooted in the native character. Agrarian outrage is unknown; there is not on record an instance of machine-breaking, rick-burning, or hamstringing of cattle; all are interested in the preservation of order, for all have a property."

We hear so much of the evils of excessive subdivision, as illustrated by the condition of Ireland, and are so much accustomed to be told by the political economists that large farms conduce to production, that it is difficult to understand that any good can attach to the Guernsey system, thus described. Yet, if we are to believe the writer under our notice, while population is more than four times denser in Guernsey than in Ireland, beggary is unknown, the people enjoy peace and comfort, and an immense quantity of surplus produce is exported. We cannot follow the writer into the speculations which he founds upon his facts; but we render him our hearty thanks for the account he has given us of a system which certainly appears, as far as exemplified, to conduce greatly to human happiness, and of which it is cheering to a philanthropic mind even to imagine, much more to see realised, upon however small a scale.

BIOGRAPHIC SKETCHES.

PROFESSOR SAMUEL LEE.

It is not unknown to the public that the Reverend Samuel Lee, Professor of Arabic at Cambridge, was a self-taught genius, and made his way to his present situation through very remarkable difficulties. Chancing lately to find an account of the early life of this learned person in the Report of a Bible Society, we were so much struck with it, that we deemed it worthy of being made more generally known. It is awkward, we confess, to detail so many things to the praise of a living man; yet, as they have been published before, and are calculated to do much good wherever they are read, we trust he will pardon the liberty we are about to take.

Mr Lee was born at Longnor, in the parish of Conover, and county of Salop: the date has not been mentioned, but it was probably from ten to fifteen years antecedent to the close of the last century. The only education he received was that of a village school, where nothing was taught besides reading, writing, and arithmetic. At twelve years of age, he left this school, and was placed at Shrewsbury with a relative of his own, to learn the trade of a carpenter and builder. He soon became noted for the skill, neatness, and ingenuity of his mechanical operations, and for his dexterity in those performances on musical bells for which England is remarkable. But it was in the acquisition of languages that he chiefly displayed the powers of his extraordinary mind. To this study he appears to have been impelled purely by the force of his own natural gifts. He had no example before him, to raise in his breast an anxiety to excel as a linguist: he had no one to recommend the study to him, as likely either to improve his mind or advance his fortune. Of the steps by which he acquired languages we have no detailed account. Mr Archdeacon Corbett, in describing his progress at a meeting of the Shropshire Bible Society in August 1818, speaks of him as commencing his studies in Latin about the year 1806, and as prosecuting them under the pressure of severe labour and many cares, without the stimulus of either hope or fear; seeking concealment rather than the smile of approbation, and very scantily supplied with materials. "At this time," says the venerable archdeacon, "his earnings were barely sufficient for the poorest maintenance; yet he spared from this pittance to purchase such a grammar as could be met with upon the book stalls of this town (Shrewsbury); and when he had read through one volume procured in this manner, he

was forced to pay it away again, as part of the price of the next book he wished to purchase." He omitted at this time none of the hours usually devoted by his fellow-artizans to manual labour, so that the time he could devote to study was very small. His opportunities were further abridged by a disorder in his eyes, which forbade reading at night. Nevertheless, in the space of six years, and while still, we believe, under twenty, he had taught himself the Latin, Greek, Hebrew, Chaldee, Syriac, and Samaritan languages, being able to write as well as read the first three. This, says Archdeacon Corbett, he did, "unaided by any master, uncheered by any literary companion, uninfluenced by the hope of either profit or praise."

The obscure and almost secret studies of this singular youth at length brought about a slight change in his situation. He was promoted from his mechanical labours to the scarcely less servile drudgery of teaching a humble charity school. The change brought him little advantage, as far as leisure for study was concerned; but it did him an important service in introducing him to the notice of the eminent Oriental scholar, Dr Jonathan Scott, who had been Persian secretary to Mr Warren Hastings in India. Dr Scott presented an Arabic grammar to Mr Lee, who had now for the first time the pleasure of conversing upon the studies in which he was engaged. In the course of a few months he was able both to read and compose in the Arabic and Persian. Through Dr Scott's unremitting exertions in his behalf, he afterwards formed an engagement with the Church Missionary Society, and was admitted to Queen's College, Cambridge, with a view to his taking holy orders.

When he entered at the university, he was unacquainted with mathematics; but in one fortnight he qualified himself to attend a class which had gone through several books in Euclid, and he soon after discovered an error, not indeed in Euclid, but in a treatise on Spherical Trigonometry usually bound up with Simpson's Euclid, the 14th proposition of which Mr Lee disproved. Now, as Simpson's edition of Euclid may be looked upon as a text-book at either university, as it is the one usually put in the hands of students, and to which the lectures of the tutors apply, it is most wonderful if a mistake should have been pointed out in such a work, and for the first time, as it would seem, by a student of not many weeks' standing in that science. Though he thus manifested great aptitude for the study by which the highest honours are acquired at Cambridge, he did not allow himself to be led too deeply into it, reflecting that his main object in being at college was to accomplish himself as a preacher. In proper time he was ordained as a minister of the Established Church of England, and immediately thereafter began to preach to large congregations.

Archdeacon Corbett, speaking, it will be recollected in August 1818, described Mr Lee as then skilled in seventeen languages besides his own, namely, Latin, Greek, Hebrew, Chaldee, Syriac, Samaritan, Arabic, Persian, Hindostanee, French, German, Italian, Ethiopic, Coptic, Malay, Sanscrit, and Bengalee; all of which had been acquired in the space of fourteen years. The venerable archdeacon justly remarked that this was a greater wonder than was presented in the famous case of the Admirable Crichton, who, at twenty-one, was said to know eleven languages besides his own, namely, the Hebrew, Syriac, Arabic, Greek, Latin, Spanish, French, Italian, Dutch, Flemish, and Slavonian. Mr Lee had made himself well acquainted with the classical productions of Greece and Rome; but he was chiefly inclined to cultivate the languages of the east, as those most calculated to be of service in advancing the missionary cause. He had therefore engaged in or perfected a series of literary labours, of which the following note was presented by Archdeacon Corbett:—

1. The Syriac New Testament, edited by Mr Lee, and published, is not a continuation of that begun by Dr Buchanan, but an entirely new work, for which Mr Lee collated three ancient Syrian MSS., the Syrian Commentary of Syrius, and the texts of Ridley, Jones, and Welstein.

2. An edition of the Malay New Testament, from the Dutch edition of 1733; and the Old Testament is now in the press.

3. An enlarged and corrected edition of Mr Martyn's Hindostanee Prayer-Book, in conjunction with Mr Corrie.

4. A tract, translated into Persian and Arabic, and printed, entitled "The Way of Truth and Life," for the use of Mahometans.

5. A Malay Tract for the London Missionary Society; and some tracts in Hindostanee, for the Society for Instructing the Lascars.

6. A tract in Arabic, on the New System of Education, written by Dr Bell, and first translated by Michael Sabag for Baron de Sacy, oriental interpreter to the king of France.

7. Dr Scott having translated the Service for Christmas-day from the Prayer-Book of the Church of England into Persian, Mr Lee has added to it the rest of the Liturgy.

8. Mr Lee has under hand a new translation of the Old Testament into Persian, in conjunction with Mirza Khaleel.

9. Mr Lee is printing an Hindostanee New Testament.

10. He is preparing for an Ethiopic Bible and other works.

* There appears to be a resemblance betwixt this plan and that of *fencing ground* in Scotland.

11. Mr Lee has moreover made a new fount of letter for Hindostanee and Persian printing; and a new fount for an edition of the Syriac Old Testament, and for which he has collated nine ancient MSS. and one ancient commentary. Some of these were collated for the London Polyglot, but Mr Lee looks upon those collations both as incorrect and deficient. He hopes to restore many omissions, both in the London and Paris Polyglots."

The spokesman added—"The whole of Mr Lee's life has been sober, moral, and consistent. He bears his faculties most meekly. The resources of his mind are unapparent till called forth. He seeks not polished society, but he mingles in it when invited, without effort and without embarrassment; and without losing any of his humility, he sustains his place in it with ease and independence. Mr Lee's learning is without any tincture of pedantry; and his religion is as far from enthusiasm on the one hand, as it is from lukewarmness on the other."

In March 1819, Mr Lee was elected Professor of Arabic at Cambridge, under circumstances which reflected great honour upon him. Not having been at college the time usual for taking his degree of A.M. requisite to his standing for the chair, a *grace* passed the senate to supplicate for a mandamus from the Prince Regent, which was graciously granted by his Royal Highness. In this distinguished situation Mr Lee still continues.

WILD SPORTS IN LITHUANIA.

In Lithuania, formerly a part of Poland, now a province on the western borders of the Russian empire, wild animals still abound, particularly wolves and bears. When it is mentioned that the country is still partially overspread with forests, and that one of these, styled the Grand Forest, is no less than twenty-five miles in extent each way, this will not appear surprising. The cattle belonging to the peasantry suffer much from these animals, and it accordingly becomes necessary, at certain periods of the year, to hunt them, with a view to keeping down their numbers. A Scottish gentleman of our acquaintance, who spent the last summer in Lithuania, and joined occasionally in both wolf-hunts and bear-hunts, supplies us with the following particulars of an affair of the former kind.

A wolf-hunt usually takes place on a Sunday, as on no other day would it be possible to gather a sufficient body of the peasantry to join the regular huntsmen. One Saturday evening, a pack of wolves which had been very destructive amongst the cattle about three weeks before, was reported by the head huntsman, at the house where our friend resided, to have taken up a position in the centre of the Grand Forest. A party of chasseurs was immediately ordered to proceed to the forest, for the purpose of *calling the wolves*—a duty which consists in keeping up a howling noise near the wolves all night, to which the wolves reply, the men thus ascertaining the exact place where the animals are prowling, and also the den or covert in which, at the approach of morn, they station themselves for the day. When the wolves on this occasion had taken to their covert, the chasseurs returned and made their report, and notice was immediately communicated to the people of the neighbourhood, to assemble at church with all the fitting accoutrements.

When mass was ended, seventy men with guns, and a hundred and fifty *beaters*, ranked themselves up as ready to attend the hunt. After travelling six or seven miles, the party arrived at the centre of the Grand Forest, where a number of the under-chasseurs were in waiting. "I think," says our friend, "the horses on which my host and I were mounted must have known what we were going after, from their snorting so much, and patting the ground in so remarkable a way with their feet. When the party was assembled in the wood, and, looking round me, I saw such a multitude of eager-looking men, clad in such various costumes—some of them of an eastern cast—and armed so variously, I could not help wishing that David Wilkie or William Allan had been present, to fix the scene upon immortal canvass."

No extraordinary adventure signalled the hunt; but the way in which it was set about is worthy of being particularised. At the distance of about a quarter of a mile round the covert of the wolves, a circle is formed by the party, the chasseurs and other armed persons filling the one half of this circle, each man about thirty yards distant from another. The other half of the circle is formed by the more numerous class named *beaters*, whose duty it is in the first place to advance slowly, beating the bushes as they move along, for the purpose of driving any stray wolves towards the centre. In the middle of the beaters the head huntsman takes up his station; and, directly across the circle, in the middle of the chasseurs and armed peasants, did our informant and his host plant themselves, that being the point to which it was most likely that the pack, when dislodged, would proceed, so that they had the best chance of a shot of the whole party. All the persons engaged were on foot.

When the semicircle of chasseurs and armed peasants had been properly formed, and the beaters were also marshalled in proper order, the head huntsman blew his horn, as a signal for the commencement of the hunt. The beaters then advanced in a close phalanx, which always grew closer as they approached the den. Notwithstanding all their care, however, three of the wolves broke through their ranks and escaped. The other two—for there were but five—ran forward, but not, as had been expected, towards the place where our informant was stationed. They went in different directions towards the sides of the semicircle, where they were shot by the chasseurs. It is perhaps scarcely worthy of being mentioned here, though it was productive of some good soup at the time, that three hares were added to the more important game. A chasseur now stationed himself at the original place of rendezvous, whence we had set out to take our places in the circle: by blowing a horn, he quickly gathered us all together once more at that spot, where the appearance of the party was even more striking than before, in consequence of the excitement which had been raised by the hunt. Presently, two peasants approached, bearing the two slain wolves on their backs, which, with great glee and triumph, they laid at the feet of the chief gentleman of the party. With this ceremony ended the hunt. It was afterwards learned that two of the wolves which had broke through amongst the beaters, found their way into the neighbouring road, where a gentleman travelling along on horseback, seeing their ferocious appearance, gave himself up for lost, but was speedily relieved from his terrors, as the animals, too much frightened to attack any human being, instantly plunged into the forest on the other side. The wolf is in his ordinary state a cowardly animal, and never attacks human beings except when very hungry, or when put to great difficulty in a hunt. In these conditions, however, he is decidedly dangerous. Our friend, one day passing a field in the course of being reaped, was surprised to see two chasseurs apparently mounting guard on the reaping party, one at each flank. Inquiring the reason, he learned that the soldiers were there to protect the reapers, in the event of a hungry wolf walking up to them from the neighbouring forest. He also learned that, not long ago, a peasant girl, returning from Wilkomirz to this place, was attacked by some wolves, and so dreadfully torn by them before she was rescued, that she died the following day.

The bear-hunt is rather of a more dangerous nature than the wolf-hunt. Two kinds of bears haunt the Grand Forest; the large black bear is the more powerful and fierce of the two. He is a cunning, as well as a fierce animal, and proves very destructive to horses, cattle, and sheep. Nor does he scruple, when he finds an opportunity, to walk off with the children of the peasantry. When attacked in his den, he makes a most determined fight, often killing the dogs, and sometimes even the hunters. Last spring (1838), at a bear-hunt which took place near the house where our friend resided, a gentleman, observing a large black bear approaching, discharged his piece at the animal, aiming, as he thought, at a vital part. The bear tumbled over, and the gentleman, supposing him killed, or at least thoroughly disabled, went up to the spot. The monster almost instantly recovered his feet, and attacked the hunter, from whose face and head he tore off the whole integuments, before any one could come up to his assistance. The unfortunate gentleman lived thirty-six hours in this deplorable condition. The brown bear is less dangerous; he lives chiefly on honey and vegetables, but, when put to a push, can fight a good battle. A curious instance of the revengeful spirit of a bear was mentioned to our friend. A peasant having lost a cow, and observing the marks which had been made by the animal as it was drawn into the forest, followed immediately upon those traces, and after walking a long way, came to a spot where he found the cow lying on the ground half devoured. Feeling assured that the depredator was not far off, and would in time return to renew his feast, he erected a kind of stage between two trees, for the purpose of fully commanding the spot, and being also in some degree of safety from the bear. Here he took his station with his gun in his hand, and a boy for a companion. In the course of a few hours, a large black bear made its appearance, and began to regale himself with the cow. The man fired, and the bear rolled over, as if killed. He descended from the stage to complete his victory if necessary, but was immediately attacked by the monster in a most furious manner. The boy ran off screaming, and soon brought a number of peasants with sticks to the rescue of their companion, but before they could force the bear to let the man go, he was quite dead. They bore off the body through the wood towards his home, and, as they went, the bear hung upon the party, and, wounded as he was, made repeated and furious efforts to get his victim once more into his power. When they reached the house, and deposited the body, the animal came up to the door, and made many attempts to force his way in, his object evidently being to revenge himself still further upon the man who had wounded him. In a little, growing faint with loss of blood, he withdrew with two or three fearful growls, lay down opposite the door, and died.

Of the other sports of Lithuania, our friend supplies the following note from his journal. "The fishing is excellent. In the river St Swinton, which runs close by, and joins the Niemen at Kovno, the salmon reach

to about thirty pounds weight; and I never ate better fish at Broughty Ferry. (St Swinton is the river the Prince of Lithuania was baptised in when converted to Christianity.) There is also a kind of sea-trout, which gives very good sport. One forenoon I killed twenty-seven, some weighing nearly two pounds, all with a small black fly and a light fishing-rod. This kind of angling was never before heard of in this country. There is also in the loch near the house, excellent pike, perch, and bream, which give good sport. Some pike have been killed, weighing upwards of twenty pounds."

OCCASIONAL NOTES.

DOMESTIC GREENHOUSES.

A PLAN has lately been discovered for keeping green plants in a fresh and lively growing state, in all seasons and climates, with a very small degree of trouble. As it must be quite new to many of our readers, though well known to professional horticulturists and men of science, I shall try to describe it, from a recollection of seeing it in operation in London in the autumn of last year. It is, I suppose, generally understood that greenhouse plants, among which may be numbered many flowering tender herbs, will not grow in the open air in a town, or even in a carefully kept room. The smoky or otherwise impure atmosphere either kills them outright, or causes them to languish, so that at the best they are poor stunted things. But, besides being deprived of pure air, the plants are not properly and regularly watered. Watering only now and then does not suit all kinds of plants; many require to live in an atmosphere from which moisture can be at all times drawn. In short, by the common artificial methods, it is often impossible to imitate the processes of nature so effectually as to keep a number of pet flowers and shrubs about our dwellings in a state of health and beauty.

The new and improved method consists simply in the use of a glass case for the plants. The case may be the size of a room, or of a box—it is all one. The top and sides of the case are of glass frames; the bottom contains earth in which the plants grow; the whole is kept closed, except at short intervals, when a small door is opened for any necessary purpose. The case may be placed in a room at a window full in the sun's light, or if the enclosure be large, like a greenhouse, it may be situated out of doors. The plants being set in the usual manner, the earth is saturated to a certain extent with water, and the case closed. Nature now takes upon itself the entire management of the process. When the sun shines on the case, the moisture rises in a natural evaporation from the earth, and hangs in condensed globules on the inside of the glass. When the cold of evening ensues, the moisture descends, and is absorbed by the plants and by the earth. Thus alternately rising and descending, the moisture in the case keeps up a proper and regular system of irrigation, whereby the plants are sustained in a state of great freshness and beauty. I am not aware that there is any precise method followed for admitting fresh air into the case, and am inclined to believe that this is accomplished only by the casual opening of the small door, or by slight crevices in the frame-work.

A gentleman residing in the eastern and most confined part of London, has brought the growth of plants by these very simple means to an extraordinary degree of perfection. In one of his front rooms he has a case, about the size of a bird-cage, in which there grow a variety of plants, native and exotic, in the most lively state of health and freshness; and in a small back court he has erected a series of sheds, enclosed, and framed with glass on top and front, in which a prodigious variety of plants are seen growing in an equally healthy condition. On being conducted into one of these enclosed out-houses, I was struck with admiration of the freshness and greenness of the vegetation. From the ground grew tall exotics, and from jutting stones resembling rock-work, there depended mosses and creeping plants of divers kinds in a state of as luxuriant vegetation as if they had sprung amongst the cliffs which overhang a Highland lake. Yet all this was in one of the smokiest parts of London, in a confined back court, where a breath of fresh air could not at any season be reasonably expected, and where certainly the same plants could not grow in the open air, notwithstanding every care which might be bestowed upon them. What a triumph is this over local circumstances! Here is a gentleman of taste, who, though placed in a situation the most untoward, has it in his power, at the merest trifle of expense, to cultivate at least one of the branches of the delightful science of botany, and at all times enjoy the contemplation of some of nature's most beautiful works.

A special advantage of this mode of plant-culture consists in its applicability to the transportation of certain growing vegetables to distant countries. It has hitherto been difficult to keep plants alive on ship-board, in consequence of the great quantity of fresh water which they require. The expenditure of water, for instance, in taking plants from Great Britain to New South Wales, is so considerable as to be a complete bar to their exportation. This obstacle to the diffusion of plants no longer exists. By the above described method, growing plants are carried safely

round the world without requiring a drop of additional water during the voyage. There may now therefore be a free interchange of a variety of vegetables betwixt the most distant parts of the earth. The heaths, ferns, wild-flowers, furze, and "lang yellow broom" of Scotland, may now be transported with ease across immense oceans, to gladden the eyes of our countrymen in America or Australia. Such, indeed, has already been done. Not long ago, as we have been informed, there was an exhibition of a number of our indigenous plants in Sydney, some of which, from the force of early recollections, affected the spectators even to tears.

For an account of the kind of plants to which this mode of culture is most suitable, I must refer to recently published works on botany, where, in all likelihood, the subject is scientifically treated.

VISIT TO THE CAVE OF CASTLETON IN DERBYSHIRE.*

I HAD travelled one hundred and seventy miles from London, when, on ascending the highest eminence which lay before me, I all at once obtained a view of a charming valley completely enclosed by mountains, and intersected by rivers and brooks. In this valley lay Castleton, a small village consisting of mean-looking houses, and which derives its name from an old castle, the ruins of which are still to be seen. A narrow path winds down the side of the mountain into the valley and through the town, where I quickly swallowed a refreshment, and continued my journey to the cave. A small brook, which flows through Castleton, guided me to the entrance. Here I stood gazing a while in wonder and astonishment at the enormous masses of steep rock which rose before me, overgrown on both sides with green shrubs, and crowned at the top with the shattered walls and towers of an ancient stronghold that once stood there, while at the bottom yawned the immense opening of the cavern. As I stood rapt in admiration at the scene, I observed a person of rather rough and wild aspect standing in the gloomy mouth of the cave. In a voice which in harshness corresponded with his uncouth appearance, he asked me if I wished to see it. I answered in the affirmative, and he forthwith told me to follow him boldly, and we stepped together into the cave. On the left-hand side of the entrance lay a huge trunk of a tree, near which the boys of the village were playing. The descent was somewhat steep, so that the broad day which seemed streaming through the entrance was gradually lost in twilight. After proceeding forward a few paces, what was my surprise on perceiving all at once on my right, under the immense vault of the cave, a whole subterranean village, where the inhabitants, it being Sunday, were enjoying an interval of repose, and sat with their children before the doors of their lowly dwellings, apparently cheerful and happy. Immediately on passing these abodes, I saw here and there a number of large wheels, with which on working days the subterranean inhabitants manufactured ropes and cordage.

As we descended deeper down, the opening by which the light of day entered, appeared to grow smaller and smaller, and the darkness to increase almost with every step we took, until at length only a few rays seemed to dart through a little aperture, and which coloured the thin cloud of vapour that rose curling through the twilight to the vaulted roof of the cavern.

At last we arrived at a door where the high vault of rocks closed upon us, and here an old woman presented us with a couple of lights, each of us taking one in his hand. My guide now opened the door, which totally excluded the faint twilight that yet remained, and conducted me into this temple of Night, whose vestibule alone I had yet traversed. The roof here was so low, that for some paces we were under the necessity of stooping our bodies to be able to pass. But how great was my astonishment on reaching the opposite extremity of this strait, to see, as far as our lights permitted us, the vault expand into a length, height, and breadth, so amazing as to make the first huge cavern through which we had come appear of no consideration. After walking for a whole hour over a flat sandy soil, as if beneath a black midnight sky, so lofty was the roof, and so deep the darkness, the rocks again began by degrees to decline in height, and we found ourselves suddenly on the margin of a tolerably broad river, which, with the glimmer of our lights, threw back a remarkable reflection on the surrounding gloom. To the bank of the stream there was fastened a small boat, in which some straw was lying; and my guide told me to step into it, and stretch myself out in the bottom, because in the middle of the river the impending rocks approached very near the edge of the water. After I had done so, he stepped into the stream, which reached above his middle, and drew the boat after him. The solemn stillness of death reigned around us, and as we advanced, the rocks, like a dark-grey cloud, sank deeper and deeper, till at last they almost touched my face, and I was scarcely able to hold the light from my breast. In this position I lay as in a coffin, not daring to move, until the frightful strait was passed, and the rocky roof of the cave again swelled upwards on the opposite shore, where I was safely set down by my conductor.

Our way was now all at once broad and high, and

then, as suddenly, again it became low and narrow. As we passed, we observed on each side of us a multitude of petrified plants and animals, some of large size, others smaller, but which, from want of time, we could not stay to examine. We now arrived at a second river, not, however, so broad as the first, for we were able to discern the opposite shore; and there being no ferry-boat here, my guide carried me across on his shoulders. Proceeding onwards a few steps, we came to a third narrow stream of water, which extended lengthways before us, and led the way to the extremity of the cavern. The road which wound along this rivulet was wet and slippery, and sometimes so narrow that we scarcely could get one foot placed before another. Notwithstanding the difficulties which I had to surmount, I with pleasure continued my journey along the subterranean shore, delighted with the appearance of the wonderful objects which surrounded me in this realm of darkness and shadows, until my attention was suddenly arrested by sounds resembling music heard from a distance, which broke the silence of this dreary solitude.

Struck with astonishment, I came to an instant halt, and asked my guide what was the meaning of this? "You will soon see," was his reply.

But as we went on, the melodious tones died away; the noise became fainter and fainter, and was lost at last in a gentle drizzle, as if caused by drops of rain falling from the roof. How great was my surprise to find this was really the case, and that, from the rocks above, as from a dense cloud, an everlasting shower of rain descended, the drops of which, now glittering in the light of our torches, had, by their fall on the floor, caused the melodious sounds which we heard! The phenomenon is occasioned by a muddy brook, which searches down through the veins of the rocks above, and drips into the vault as from a huge filter.

We dared not approach too near, lest the falling drops should extinguish our lights, and then, perhaps, we might in vain have attempted to explore our way back. We continued our course along the margin of the narrow stream, and, in passing, I observed a number of wide openings in the walls of rock which rose on each side of me. They seemed the entrances to new caverns, but I proceeded without stopping, till told by my conductor to prepare for one of the most splendid appearances of the cave, and which was just at hand. Scarcely had I gone on half a dozen of steps, when I was ushered into a majestic temple, consisting of magnificent arches resting upon beautifully formed pillars—all so delicately moulded, that they seemed the handiwork of an accomplished architect, rather than the fortuitous productions of nature. This subterranean temple, whereon no human hand had been laid, appeared to me at the moment in regularity, splendour, and beauty, to surpass the most lordly structures I had ever beheld.

We now approached the termination of our journey. The little streamlet faithfully accompanied us to the farthest extremity of the cave, while to the last the roof continued to bend like an arch. It then rapidly declined in height till it came into contact with the brook, which here made a semicircular bend. The cavern was thus closed as with a door of adamant, for ever barring all farther progress to human foot. Hereupon my conductor sprang into the water, and swam over to the rocks, and also down for some feet, for the purpose of showing me that it was impossible to get any farther, unless we could blast the rocks with gunpowder, and perhaps open up a second cavern. It was now my belief that our next way would be back again; but I was destined to encounter greater difficulties and to behold lovelier scenes than any which I had hitherto met with.

Turning himself round, my conductor led the way through an opening in the wall of rock on the left hand, and I followed him. He now inquired if I had any objections to creeping a tolerable distance beneath rocks which brooded so low as almost to touch the ground; and telling him I had not, he bade me take great care of my light, and faithfully follow him. Crooking our bodies, we commenced our journey on all fours, over wet sand, and through openings of rock scarcely large enough to allow our bodies to pass. After completing this irksome part of our travel, and assuming the erect posture, the first object which attracted my notice was a steep hill rising to such a height in the cavern, that it appeared to be lost as in a cloud amongst the lofty rocks which frowned above us. So wet and slippery was this elevation, that on attempting to ascend it, I instantly lost my footing and fell back. But my guide, laying hold of my hand, told me to fear nothing, but boldly accompany him, as he well knew where a firm footing was to be obtained. We began our ascent, and rose to such a height, at the same time looking down into such a frightful chasm on either side, that my head yet grows giddy when I think upon the scene.

At length we reached the summit, where, having been pointed out a secure place to stand upon, my conductor told me to remain without stirring, and then, descending the hill, left me alone to meditate on my situation. I lost sight of him for a considerable time; at last I perceived not him, but his light, shining like a beautiful star far down in the depths of the abyss. The view was splendid, indeed indescribably so; and after allowing me to enjoy it a sufficient length of time, my guide returned, and taking me on his shoulders, I was safely landed on the spot from which the ascent was begun. But a still more surprising sight

awaited me. Leaving me standing where I was, he again ascended the hill, and placing his light in such a manner as to make it shine through a small opening of the rocks (while at the same time I concealed my own light with my hand), it seemed as if at darkest midnight a star were gleaming through a thick cloud; it was a sight which, in loveliness, far surpassed anything that I had seen. We had now reached the limits of our subterranean journey, and with much trouble and difficulty we retraced our steps to the world above us. Again we entered the solemn temple which we had so lately left; heard anew the rain-drops gently drizzling near us; listened to the melodious sounds which they produced at a distance; re-crossed the streams which flowed on so noiselessly; and passed along the vast hall of the cavern to the narrow door where we had taken leave of the light of day, and which I again longed to hail after my sojourn in this realm of darkness. But before my guide opened the little door, he bade me prepare for yet another sight, which, he said, would excel in beauty all the former views. I found that he was right; for on opening the door only half, I felt, not dreamingly, but in reality, as if I had obtained a glimpse of Elysium—so wonderfully beautiful did every object appear in the refreshing twilight which dawned upon the gloom. Day gradually broke upon me, clearer and clearer, and night and darkness vanished in proportion. Far in the distance, I first saw the smoke of the cottages, and then the cottages themselves. Still higher up, the boys, yet at their play around the large tree, came into view; then I beheld the purple streaks which ran along the evening sky beaming through the opening of the cavern, and, just as we reached its mouth, the sun disappeared below the western horizon. I had thus spent nearly half a day in the cavern; and when I began to examine myself a little attentively, I found that, in regard to attire, I bore a tolerable resemblance to my guide, whose dilapidated dress had attracted my notice when we first met. My shoes, too, scarcely held together on my feet, so much had they been torn and destroyed by my walk over moist sand and hard sharp-pointed stones.

THE BROOCH OF LORN.

Whence the brooch of burning gold,
That clasps the chieftain's mantle-fold,
Wrought and chased with rare device,
Studded fair with gems of price,
On the varied tartan beaming,
As, through night's pale rainbow gleaming,
Painter now, now seen afar,
Fits shines the morning-star.

Lord of the Isles, Canto II.

In these lines Scott makes allusion to a jewelled brooch worn by the heroic King Robert Bruce, as a means of keeping together the folds of his plaid or mantle, and which still exists in the possession of the chief of one of the Highland clan families. As this bijou has gone through some rather remarkable adventures, a short history of it, which we derive from the best, and in part from original sources, may be interesting to our readers.

The brooch, we must premise, is an article essential to the dress once worn by both sexes in the Highlands. Brooches were used by all ranks in that country, and were of all degrees of plainness and elegance, from the simple ring with a tongue across it, up to the massive silver plate of complicated mechanism, and glittering with precious stones. A Highland bridegroom gave his bride, not a ring, but a brooch, usually with some affectionate inscription upon it; and as the same article sometimes served several generations of one family, it was apt to become invested with many endearing associations. A friend of the writer has seen one inscribed with the names of five successive couples of one family, of whose matrimonial union it had been the outward symbol. Sometimes a still more sacred feeling was connected with the brooch, and it was considered as a sort of amulet, possessing a power to charm away disease. Pennant, in his Tour of 1769 gives a drawing of a beautifully jewelled one, belonging to Campbell of Glenlyon, the reverse side of which contained the names of the three kings of Cologne, Caspar, Melchior, and Baltazar, with the word *consummatus*—a clear proof that it was a consecrated article, as it is well known that the names of the royal sages, written on slips of paper, or otherwise were esteemed in the middle ages (and perhaps to this day in some parts of Europe) as preservatives against the falling-sickness.

The brooch to which the present paper more immediately refers, is represented by unvarying tradition in the Highlands as having been worn by Robert Bruce king of Scotland. It is not of gold, as Scott, from misinformation, erroneously represented it, but of silver, and consists of a circular plate, about four inches in diameter, having a tongue like that of a corset buckle on the under side. The upper side is magnificently ornamented. First, from the margin rises a neatly formed rim, with hollows cut in the edge at certain distances, like the embrasures in an embattled wall. From a circle within this rim, rise eight rows tapering obelisks, about an inch and a quarter high finely cut, and each studded at top with a river pearl. Within this circle of obelisks, there is a second rim also ornamented with carved work, and within which rises a neat circular case, occupying the whole end of the brooch, and slightly overtopping the obelisks. The exterior of this case, instead of forming a plain

* By K. P. Moritz, a German author of celebrity.

circle, projects into eight semi-cylinders, which relieve it from all appearance of heaviness. The upper part is likewise carved very elegantly, and in the centre there is a large gem. This case may be taken off, and within there is a hollow which might have contained any small articles upon which a particular value was set.

In the summer of 1306, Robert Bruce caused himself to be crowned at Scone, but almost immediately afterwards was overthrown in battle by the troops of Edward I., which then occupied the country. With only a few gentlemen in his train, he was obliged to become a fugitive and vagabond in the country which he lately pretended to govern. On the 11th of August, as he was endeavouring to make his way across the Highlands, in order to take refuge in Ireland, he was encountered at a place now called Dalree, near Tyndrum, on the borders of Argyshire, by a powerful lord, named in ancient writings "Alexander of Argyre," the ancestor of the Macdougals of Lorn. Alexander was one of those great Hebridean and Argyshire chiefs who at this time, and for more than a century after, deemed themselves independent of the king of Scotland. He was in alliance with the English monarch, and had further and more special causes of hostility to King Robert, from his being uncle by marriage to John Cuming, whom Bruce had recently slain at Dumfries. A fierce combat ensued between Bruce's party and the followers of the Lord of Argyre, as related in the following terms by Barbour (the spelling being modernised):—

'The king's folk full weel them bare,
And slew, and felit, and wounded sair;
But the folk of the other party
Fought with axes sae fellily,
For they on foot were everik ane,
That they feil of their horse has slain.*
And till some gave they wounds wide;
James of Douglas was hurt that tide
And also Sir Gilbert de la Hay.
The king his men saw in affray,
And his enseinzie 'gan he cry;
And amang them right hardily
He raid, that he them dushit all,
And feil of them there garred he fall.
But when he saw they were sae foill,
And saw them sae great dints deal,
He dreed to tyne his folk.† Forthly,
His men till him he 'gan rely,
And said, 'Lordings, folly it were
Till us for till assemble mair,
For they feil of our horse has slain;
And gif we fecht with them again,
We sall tyne of our small menzie.‡
And ourselves sall in peril be.
Therefore methink maist awenand
To withdraw us, us defendand,
Till we come out of their danger,
For our strength at our hand is near.'

Then they withdrew them hardily,
But that was not full cowardly,
For then intill a sop held they,
And the king him abandoned ay,
To defend behind his menzie;
And through his worship sae wrought he,
That he rescued all the flecra,
And stinted sae-gate the chasra,
That nane durst out of battle chase,
For always at their hand he was.
Sae weel defended he his men,
That whasever had seen him then
Prove sae worthily vasselage,
And turn sae oft-siths the visage,
He suld say he aucht weel to be
A king of a great royalty.'

The poet then states that the Lord of Lorn himself could not help admiring the prowess of the king, whom he likened to Gaul, son of Morni, famous in Celtic fable. But the action was not yet concluded:

— "two brothers were in that land,
That were the hardiest of hand,
That were intil all that countrie;
And they have sworn, if they might see
The Bruce, where they might him o'erta',
That they should die, or there him slay.
Their surname was Macindrosser,
That is, as mickle to say here
As the *Durward's* son perlay.
Of their covin ¶ a third had they,
That was right stout, ill, and feloun.
When they the king of great renown
Saw sae behind his menzie ride,
And saw him turn sae mony-tide,**
They abade till that he was
Entered in a narrow place
Betwixt a loch-side and a brae,
That was sae strait, I underta',
That he might not weel turn his steed;
Then with a will till him they gaed;
And ane him by the bridle hynt:
But he raucht till him sic a dint,
That arm and shoulder flew him frae.
With that ane other 'gan him ta'
By the leg, and his hand 'gan shoot
Betwixt the stirrup and his foot;
And when the king felt there his hand,
In his stirrups stithly 'gan he stand,
And strack with spurs the steed in hy,††
And he launched forth deliverly;

Sae that the tother failed feet,
And not forthy his hand was yet
Under the stirrup, maugre his.
The third, with fall great hy, with this
Right till the brae-side he gaed,
And start* behind him on his steed.
The king was then in full great press;

— syne him that behind him was,
All mangle his will, him 'gan he rass†
Frae behind him, though he had sworn,
He laid him even him before,
Syne with the sword sic dint he gave,
That he the head to the harns clava.‡
He rushed down of blood all red,
As he that stound fell off dead.
And then the king, in full great hy,
Strak at the other vigorously,
Whom he after his stirrup drew,
That at the first straik he him slew.
In this wise him delivered he
Of all these felon faes three.'

The king and his party were now permitted to retire. He is said by tradition to have taken refuge that night in a cave at the head of the glen of Balquidder, which is still called from that circumstance *Craigree*, or the King's Rock. Another account states that his shelter that night was a cave at Craigrostan on Lochlond side, where his companions were a flock of goats; and so pleased was he, it is said, with his nocturnal associates, that he afterwards made a law exempting all goats from grass-mal or rent.

Barbour makes no allusion to the brooch; but from the unvarying nature of the tradition, there can be no doubt that he lost that part of his habiliments on this occasion. The local story is, that, in making his escape, he was under the necessity of parting with his plaid, and the brooch which fastened it. It is said that Finlay Macnab, chief of the name, who headed his clan in aid of the Lord of Lorn, came into personal conflict with the king. Throwing down his sword, he grappled with Bruce, and, being a man of uncommon strength, he was like to have the advantage, when the king, feeling himself about to be overpowered, contrived to withdraw, leaving his plaid and its splendid brooch in the grasp of his Herculean antagonist. According to another narration, Alexander of Lorn was himself the individual who entered into a personal struggle with the king. He was thrown down, and would have been slain, had not three of his vassals, named McKeoch, a father and two sons, come to his rescue, and dragged the king away by his mantle, which with the brooch remained in their grasp. In whatever way the brooch was gained, the uniform tradition represents it as continuing for centuries in the possession of the family of Alexander of Lorn, as a proud trophy of the victory gained by him at Tyndrum.

The ultimate ascendancy of Bruce proved ruinous to this great family, on the ruins of which rose the Campbells and other clans. In the seventeenth century, the Macdougals, once styled of Argyre, afterwards of Lorn, but now of Dunolly, while boasting of a most distinguished ancestry, and the chiefs of their clan, possessed but a comparatively small estate. Dunolly Castle, which overlooks the sea near Oban, and Goleen Castle in the neighbouring island of Kerrera, were their chief seats. In the civil war, the Macdougals of that day adhered to the royal cause, and suffered as much thereby as he had formerly done by opposing it. In 1647, he was besieged in Dunolly by a detachment of General Leslie's troops under Colonel Montgomery. From the impregnable nature of the situation, he was successful in holding out this strength; but Goleen Castle was taken, sacked, and burned. Campbell of Inveraw, who took part in the latter affair, secured the brooch of King Robert, or, as it was now commonly called, the *Brooch of Lorn*, which he took into his possession as fair spoil, though he did not think proper to make his good fortune too well known, lest the Macdougals might have thought it necessary afterwards to attempt the recovery of the highly-valued relic by force. Time rolled on; the Macdougals of the early part of the last century lost his lands in consequence of his embracing the cause of the Pretender in 1715; his son regained them in consequence of keeping loyal in 1745. Meanwhile, the brooch won at Dalree continued safe, amidst all the vicissitudes of the family fortunes, in the strong chest at Inveraw. To the Macdougals themselves it was not even known to exist.

At length, about thirty years ago, this precious relic passed into the hands of a cadet of the Inveraw family, who, at a subsequent time, appointed it by testament to be sold, and the proceeds divided amongst his younger children. It was accordingly, about the year 1819, sent to Messrs Rundell and Bridge in London, to be exposed for sale, the price put upon it being a thousand pounds. The late King George IV., then Prince Regent, is said to have offered five hundred pounds for the brooch, but without obtaining it; nor did any other customer appear who was willing to give the large price put upon it by the possessor. It must be understood that, when thus laid before the public, it was openly described as the *Brooch of Lorn*, originally the property of King Robert Bruce; yet the fact of its existence and exposure for sale did not become known to the representative of the Macdougals family, till after it had been withdrawn from the market. Ultimately, in the year 1825, the late amiable General

Campbell of Lochnell, being anxious to bestow some mark of grateful regard on his esteemed friend and neighbour Macdougals, purchased the brooch, and caused it to be presented to that gentleman, by his chief the Duke of Argyre, at a social meeting of the landholders of the county. It thus, after an interval of more than a century and a half, found its way back to the family, who, next to King Robert and his heirs and representatives, were certainly its most rightful owners. It is at present kept with great care at Dunolly Castle.

[NOTE.—The Brooch of Lorn was shown a few years ago at a meeting of the Antiquarian Society of Scotland, on which occasion the present writer had the gratification of seeing it. A representation of it in oil was taken at the expense of the society, and hung up in their hall in Edinburgh. Some other remarkable instances of trinkets recovered at great distances of time, may here be adverted to. About the year 1690, a year after the battle of Killiecrankie, the Viscountess of Dundee, widow of the Jacobite chief who fell in that action, paid a visit to Colzium, in Stirlingshire, a seat of the Kilsyth family. William Livingstone, afterwards Viscount of Kilsyth, and who subsequently married her, paid his first addresses to Lady Dundee on this occasion. As a pledge of his love, he presented her with a ring, which, unfortunately, she dropped next day in the garden—a circumstance regarded as extremely unlucky. To obviate evil forebodings, she offered a large reward for the recovery of the ring, but in vain. She married Lord Kilsyth, and, when he had to leave his country for his concern in the rebellion of 1715, she accompanied him to Holland, where she and an infant son were soon after killed by the fall of a house. The public were greatly surprised when, in 1795, the bodies of this lady and her child were found in an embalmed and perfect state in the vault beneath the church of Kilsyth; but it was a still more remarkable circumstance, that, in the ensuing year, the lost ring was found by the tenant of the garden at Colzium, while digging for potatoes. It had then been lost for exactly a hundred and six years. On the internal surface were the words, "Zovrs only and Euer." About a hundred years ago, Mr Murray of Toftingall in Caithness, while walking on the sea-beach, near his house, lost a massive gold ring, bearing his coat armorial and initials. So anxious was he to recover it, that all his tenants were brought to the place to look for it; but they looked and searched in vain. A few months ago, a herd-boy, sauntering on the beach, found this ring under a rock, and restored it to the descendant of the original owner, Sir Peter Murray Threipland, of Fingask, Baronet.]

THE PIASA,

AN INDIAN TRADITION OF ILLINOIS.

No part of the United States can vie, in wild and romantic scenery, with the bluff of Illinois. On one side of the river, often at the water's edge, a perpendicular wall of rock rises to the height of some hundred feet. Generally on the opposite shore, is a level bottom or prairie, of several miles width, extending to a similar bluff that rises parallel with the river. One of these ranges commences at Alton, and extends, with a few intervals, for many miles along the banks of the Mississippi and Illinois rivers. In descending the river to Alton, the traveller will observe, between that town and the mouth of the Illinois, a narrow ravine through which a small stream discharges its waters into the Mississippi. That stream is the Piasa; its name is Indian, and signifies, in the language of the Illinois, "the bird that devours men." Near the mouth of that stream, on the smooth and perpendicular face of the bluff, at an elevation which no human art can reach, is cut the figure of an enormous bird, with its wings extended. The bird which this figure represents was called by the Indians "the Piasa," and from this is derived the name of the stream. The tradition of the Piasa is still current among all the tribes of the Upper Mississippi, and those who have inhabited the valley of the Illinois, and is briefly this.

Many thousand moons before the arrival of the pale faces, when the great Magalonic and Mastodon, whose bones are now dug up, were still living in the land of the green prairies, there existed a bird of such dimensions that he could easily carry off in his talons a full-grown deer. Having obtained a human victim, from that time he sought human beings as his prey. He was artful as he was powerful—would dart suddenly and unexpectedly upon an Indian, bear him off to one of the caves in the bluff, and devour him. Hundreds of warriors attempted for years to destroy him, but without success. Whole villages were nearly depopulated, and consternation spread through all the tribes of the Illinois. At length Owatoga, a chief whose fame extended as a warrior even beyond the great lakes, separating himself from the rest of his tribe, fasted in solitude for the space of a whole moon, and prayed to the Great Spirit, the Master of Life, that he would protect his children from the Piasa. On the last night of his fast, the Great Spirit appeared to him in a dream, and directed him to select twenty of his warriors, each armed with a bow and pointed arrows, and conceal them in a designated spot. Near the place of the concealment another warrior was to stand in open view, as a victim for the Piasa, which they must shoot the instant that he pounced upon his prey. When the chief awoke in the morning, he thanked the Great Spirit, returned to his tribe, and told them his dream. The warriors were quickly selected, and placed in ambush as directed. Owatoga offered himself as the victim. He was willing to die for his tribe. Placing himself in open view of the bluff, he soon saw the Piasa perched on the cliff, eyeing his prey. Owatoga drew up his manly form to its utmost height, and placing his feet firmly upon the earth, began to chant the death-song of a warrior. A

† Reached.

‡ Gave the head into the brain.

moment after, the Piasa rose into the air, and, swift as the thunderbolt, darted down upon the chief. Scarcely had he reached his victim, when every bow was sprung, and every arrow sent to the feather in his body. The Piasa uttered a wild fearful scream, that resounded far over the opposite side of the river, and expired. Owatoga was safe; not an arrow, not even the talons of the bird had touched him. The Master of Life, in admiration of the noble deed of Owatoga, had held over him an invisible shield. In memory of this event, the image of the Piasa was engraved in the face of the bluff.

Such is the Indian tradition; of course I do not vouch for its truth. This much, however, is certain: the figure of a large bird cut into the solid rock, is still there, and at a height that is perfectly inaccessible. How and for what purpose it was made, I leave it for others to determine. Even at this day, an Indian never passes the spot in his canoe, without firing his gun at the figure of the bird. The marks of balls on the rock are almost innumerable. Not a great while since, I was induced to visit the bluffs below the mouth of the Illinois river, and above that of the Piasa. My curiosity was principally directed to the examination of the caves connected with the above tradition, as one of those to which the bird had carried its human victims. Preceded by an intelligent guide who carried a spade, I set out on my excursion. The cave was extremely difficult of access, and at one point of our progress I stood at an elevation of more than one hundred and fifty feet on the face of the bluff, with barely room to sustain one foot; the unbroken wall towered above me, while below was the river. After a long and perilous clambering we reached the cave, which was about fifty feet above the surface of the river. By the aid of a long pole, placed on the projecting rock, and the upper end touching the mouth of the cave, we succeeded in entering it. Nothing could be more impressive than the view from the entrance of the cavern. The Mississippi was rolling in silent grandeur beneath us—high over our heads, a single cedar hung its branches over the cliff, on the blasted top of which was seated a bald eagle. No other sound of life was near us—a Sabbath stillness rested upon the scene—not a cloud in the heavens—not a breath of air was stirring—the broad Mississippi lay before us, calm and smooth as a lake. The landscape presented the same wild aspect as it did before it had yet met the eye of the white man.

The roof of the cavern was vaulted, the top of which was hardly less than twenty-five feet in height—the shape of the cave was irregular, but, so far as I could judge, the bottom would average twenty by thirty feet. The floor of the cave through its whole extent was a mass of human bones; skulls and other bones were mingled together in the utmost confusion. To what depth they extend, I am unable to decide; but we dug to the depth of three or four feet in every quarter of the cavern, and still we found only bones. The remains of thousands must have been deposited here—how, and by whom, and for what purpose, it is impossible to conjecture.—*Richmond Enquirer, American paper.*

MR ROBERTS'S EXCURSION INTO EGYPT.

MR D. ROBERTS, well known as one of our most eminent painters of architectural scenery, is at present in the East, engaged in an undertaking of great magnitude, from which the lovers of the fine arts have formed the highest expectations. His object is to take coloured designs of the splendid ruins and chief existing cities of Egypt and Syria, from which, at his leisure, on his return to England, he may produce paintings in the first style of art. Mr Roberts departed on his arduous expedition some time last autumn, and his friends have been made acquainted with his proceedings since, by means of the following letter, dated from Cairo, December 24, and published a few weeks ago in the *Athenæum*:

"I will not trouble you (he proceeds) with an account of my journey through France, further than to observe that the passage down the Rhone was most delightful. At Marseilles I was detained a short time; thence I embarked for Malta, touching at Leghorn, Civita Vecchia, &c. At Malta, I changed steamers, and proceeded to Syria, a small but thriving and bustling place, which has sprung up since the establishment of the Greek independence, and which was principally formed of the unfortunate fugitives who escaped the sacking of Scio. Here I again changed steamers, leaving the Sesostris for the Rhameses, and on board of the latter I found a numerous company of Mussulmans from Constantinople on their way to Mecca; certainly as picturesque a group as painter could desire—huddled together on the deck, and provided with all the requisites for such a journey. The weather was delightful, and our voyage through the Greek islands truly one of pleasure. After four days we hove in sight of Alexandria, and all that remains of its ancient city, namely, vast heaps of rubbish, Pompey's Pillar, and the obelisk called Cleopatra's Needle. My stay here was short. Having delivered my letters of introduction, and provided myself with an Arab servant and necessities for my voyage up the Nile, I embarked in one of the native boats, and after a three days' sail found myself on a donkey in the midst of the crowded streets of Cairo. The English hotel here is good, but, being the only one, is, like all English hotels, most extravagant. Cairo exceeded my expectations; its streets, its crowded population, the sumptuous and picturesque appearance of the mosques and bazaars, beggar all description: from the crowded and narrow nature of the streets there will be much difficulty in making drawings, but still it must be done. The mosque of Sultan Hassan is not surpassed in point of magnitude, and the exquisite beauty of its arabesques, by any building in existence, St Peter's excepted; but all these I must skip over, together with the eternal pyramids themselves: the latter of which I visited, and ascended to the summit of the only one that is ascensible—gazed upon the desert that now covers the ancient Memphis—and returned, I suppose, like all who visit them, lost in wonder and conjecture; for there is so much to puzzle one in this mighty country, and its still more

mighty remains, that the mind becomes bewildered; mine was in this state when I struck a light on the summit of the Great Pyramid, and endeavoured to smoke a cigar with as much coolness as an addled pate and a burning sun would allow of.

But being anxious to get to the extremity of my journey before commencing operations, I freighted a boat or kanga, with eight men, a tent or awning for covering the deck, provisions for three months, all the necessary articles of house-keeping, or rather boat-keeping. Behold me seated, my English flag mounted at the mast-head, under an awning—sketch-book before me, my head covered with a red turban or skull-cap—a very respectable pair of mustachios—a long chibouk or Turkish pipe—commander of my own boat, a servant to attend to all my wants, and, with the exception of mosquitos, of which there were myriads, fleas, flies that cover your eyes and mouth till you can neither see nor speak, lizards, scorpions, &c., add to which about a dozen of *bats* dancing the fandango over you at night—with the exception of these, and the thermometer at about 115 or 116 degrees in the shade, all was *very comfortable*.

I cannot tell you all I found on the passage up the river. Suffice it to say, Thebes surpassed and surpasses all that can be imagined of it; and all that has hitherto been drawn of these extraordinary remains conveys no more idea of them than a country village would of the magnitude of London—I cannot find a better simile, so you must put up with this bad one. Passing the first cataract, I entered Nubia, and reached as far as 22 degrees of north latitude.—Wady Halfah. Here the navigation of the Nile southwards terminates, all beyond being a succession of rapids. Mohammed Ali, who had preceded us, having passed us lower down the Nile, on his way to Senaar and Dongola, reached as far as the first cataract in a steamer built at Cairo, and by native Egyptians. They endeavoured to get her up the cataract, but stove a hole in her bottom, lost her rudder, and the pasha left and proceeded southwards in an open boat with rowers: as she passed us, being the first steamer that had ascended the Nile, we gave her three hearty cheers. His object is to visit the gold mines worked by the ancients, which he has re-opened—a deputation of learned and scientific men accompanying him as far as where the White River joins the Nile, and which they are to explore to its source, and finally settle the long-disputed point—the source of the river. And now to myself. I began with Ebsamboul, a temple excavated in the rock, discovered by Burckhardt, cleared of the sand by Belzoni, and in the most excellent preservation, although formed by an ancient Egyptian called Rhameses, who lived 1400 years before the Christian era. It proves the arts to have been in such a state of perfection at that time, that it is very questionable whether they have been surpassed since—all of which I hope to be better able to show you on my arrival in England. From thence I took the whole line of temples, extending from this to the island of Philæ, at the first cataract (the great barrier betwixt Nubia and Upper Egypt), entering the Thebaid, where the ruins are of greater magnitude, although most are nearly buried to the capitals in the sands of the desert, including Ombi, Esneh, Abydos, Hermouths, Luxor, Karnac, Gournou, Medinet Abou, the sitting statues in the ruins of Thebes and Denderah. I have formed one of the most interesting collections of sketches, perhaps, ever brought out of any country—I mean, of course, of their kind. To these I hope soon to add Grand Cairo; and in about six weeks I shall enter Syria, by the way of Hebron and the Dead Sea, visiting Jerusalem, Bethlehem, Nazareth, Balbec, and Damascus. I think, if I am spared health, I shall return through Italy, by the way of Rome. Thank God, after an absence in Upper Egypt of nearly three months, I have returned in better health and spirits than I have had for years."

THE NEGRO FIDDLER.

A negro man was going through the woods, with no companion but his fiddle, when he discovered that a pack of wolves were on his track. They pursued very cautiously, but a few of them would sometimes dash up, and growl, as if impatient for their prey, and then fall back again. As he had several miles to go, he became much alarmed. He sometimes stopped, shouted, drove back his pursuers, and then proceeded. The animals became more and more audacious, and would probably have attacked him, had he not arrived at a deserted cabin, which stood by the way-side. Into this he rushed for shelter, and without waiting to shut the door, climbed up and seated himself on the rafters. The wolves dashed in after him, and becoming quite furious, howled, and leaped, and endeavoured with every expression of rage to get to him. The moon was now shining brightly, and Cuff being able to see his enemies, and satisfied of his own safety, began to act on the offensive. Finding the cabin full of them, he crawled down to the top of the door, which he shut and fastened. Then removing some of the loose boards from the roof, scattered them with a tremendous clatter upon such of his foes as remained outside, who soon scampered off, while those in the house began to crouch with fear. He had now a large number of prisoners to stand guard over until morning; and, drawing forth his fiddle, he very good-naturedly played for them all night, very much, as he supposed, to their edification and amusement, for, like all genuine lovers of music, he imagined that it had power to soften the heart even of a wolf. On the ensuing day, some of the neighbours assembled and destroyed the captives, with great rejoicings.—*Hall's Notes on the Western States.*

IMPROVEMENTS FROM ACCIDENT.

Next in importance to the discovery of steam was the discovery of the spinning-jenny in the manufacture of cotton, which has revolutionised the commerce of the world, and the discovery of this too is attributable to accident. Hargraves, who first invented the spinning-jenny, was a poor weaver, near Blackburn in Lancashire; his residence was near the print-ground, the first and infant establishment of the late Sir Robert Peel, to whom

he suggested his discovery, and to which circumstance the Peel family are indebted for their opulence. A number of young people were one day assembled at play at Hargraves' house during the hour generally allotted to dinner, and the wheel at which he or some one of his family was spinning, was by accident overturned. The thread still remained in the hand of the spinner, and as the arms and periphery of the wheel were prevented by the framing from any contact with the floor, the velocity it had acquired still gave motion to the spindle, which continued to revolve as before. Hargraves surveyed this with mingled curiosity and attention; he expressed his surprise in exclamations which are still remembered, and to this trifling accident was that stupendous improvement attributable at the time.—*Pilot.*

THE DEAF AND DUMB.

There are 8000 deaf mutes in England; the institutions at present in operation are not capable of educating more than 600. It is calculated that at least one-eighth of the whole number are within the age and other qualifications generally prescribed for education. It therefore seems necessary that more extended provisions should be made for their instruction.—*Newspaper paragraph.*

FAREWELL TO INDIA,

LINES WRITTEN BY A PRIVATE SOLDIER.

Land of the sun! land of the sun!
I bid thy shores adieu!
My years of exile now are run,
And smiling prospects have begun
To bless my sight anew,
And hopes, which long have withering lain,
Arise to cheer my soul again.
Thy rich mines yield the gems and ore
For which men roam and toil—
I've roamed and toiled, but leave thy shore
Poor as I left my father's door,
Poor as I touched thy soil:—
Yet me thou hast despoiled of wealth—
The bloom of youth—the rose of health!
Though thou no wintry storms dost know,
Though still thy bowers be green,
Yet, through thy changeless summer's glow,
A long, long dreary winter's snow
Hath chilled my heart, I ween;
Alas! how tardy did appear
The lingering pace of each dull year!
Once more, Madras, at sea I stand,
And eye the sullen wave
That breaks in thunders on thy strand:—
But where is now that gallant band
That with me came, the brave—
The gay!—alas, how few remain
To cross thy restless surge again!
O thou Almighty, gracious power,
My God, my only stay,
How oft, when storms began to lower,
Thy smile hath lent their merriest hour
A gleam of heav'n's own day:
Thou'lt led me, since I crossed these waves,
Safe through a path of yawning graves!
My God and Father, guide me now
Safe o'er the rolling sea,
And, while I at thy footstool bow,
For all the sunless blessings thou
Hast showered on worthless me,
Accept, most holy, just, and good,
The heartfelt gush of gratitude!
Poor helpless Hindoo tribes, farewell,
Slaves of CASTE's fourfold chain!
Soon may the sun of truth dispel
Your deep, deep darkness, black as hell,
Idolatry's foul reign,
And chase away your long digrace,
Weak, abject, ever vanquished race.
Ye followers of the Crescent bright,
Proud, warlike, dark-eyed race,
Though now your emblem's silvery light
No more shines prosperous o'er the fight,
It set not in digrace!
Farewell! though fallen from empire low,
Ye bowed to no inglorious foe!
Farewell, ye plains so parched and sere,
Where weary travellers pant;
Farewell, ye jungles wild and drear,
Where rushes in his mad career
The mighty elephant;
Where restless glaring tigers prowl,
Where serpents hiss, and jackals howl.
Mountains, farewell! whose summits high
Pierce ether's cloudless day—
Round whose dark sides the tempests fly
In winged wrath, and vividly
The fierce red lightnings play;
Where man looks down with awe and wonder,
To find himself above the thunder!
Farewell, thou clear and azure sky,
Ye life-sustaining streams!
Farewell, ye lovely scenes that lie
In beautiful calm before my eye,
Lit by the white moon-beams!
India, adieu! I leave thy shore
To see it never, never more!

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

BY MRS S. C. HALL.

"Mind not high things: but condescend to men of low estate."
ST PAUL.

"IT'S ONLY A DROP!"

It was a cold winter's night, and though the cottage where Ellen and Michael, the two surviving children of old Ben Murphy, lived, was always neat and comfortable, still there was a cloud over the brow of both brother and sister, as they sat before the cheerful fire; it had obviously been spread not by anger, but by sorrow. The silence had continued long, though it was not bitter. At last Michael drew away from his sister's eyes the checked apron she had applied to them, and taking her hand affectionately within his own, said, "It isn't for my own sake, Ellen, though the Lord knows I shall be lonesome enough the long winter nights and the long summer days without your wise saying, and your sweet song, and your merry laugh, that I can so well remember—ay, since the time when our poor mother used to seat us on the new rick, and then, in the innocent pride of her heart, call our father to look at us, and preach to us against being conceited, at the very time she was making us proud as peacocks by calling us her blossoms of beauty, and her heart's blood, and her king and queen."

"God and the blessed virgin make her bed in heaven now and for evermore, amen," said Ellen, at the same time drawing out her beads, and repeating an ave with inconceivable rapidity. "Ah, Mike," she added, "that was the mother, and the father too, full of grace and godliness."

"True for ye, Ellen; but *that's* not what I'm after now, as you well know, you blushing little rogue of the world; and sorra a word I'll say against it in the end, though it's lonesome I'll be on my own hearth-stone, with no one to keep me company but the ould black cat, that can't see, let alone hear, the craythur!"

"Now," said Ellen, wiping her eyes, and smiling her own bright smile, "lave off; ye're just like all the men, purtending to one thing, whin they mane another; there's a dale of desate about them—all—every one of them—and so my mother often said. Now, you'd better have done, or maybe I'll say something that will bring, if not the colour to your brown cheek, a dale more warmth to yer warm heart, than would be convanient, just by the mention of one Mary—Mary! what a purty name Mary it is, isn't it?—it's a common name too, and yet you like it none the worse for that. Do you mind the ould rhyme!—

"Mary, Mary, quite contrary."

Well, I'm not going to say she is contrary—I'm sure she's any thing but *that* to you, any way, brother Mike. Can't you sit still, and don't be pulling the hairs out of Pusheen cat's tail, it isn't many there's in it; and I'd thank you not to unravel the beautiful English cotton stocking I'm knitting; lave off your tricks, or I'll make common talk of it, I will, and be more than even with you, my fine fellow! Indeed, poor ould Pusheen," she continued, addressing the cat with great gravity, "never heed what he says to you; he has no notion to make *you* either head or tail to the house, not he; he wont let you be without a mistress to give you yer sup of milk, or yer bit of sop; he wont let you be lonesome, my poor puss; he's glad enough to swop an Ellen for a Mary, so he is; but *that's* a secret, avourneen; don't tell it to any one."

"Any thing for your happiness," replied the brother, somewhat sulkily; "but your bachelor has a worse fault than ever I had, notwithstanding all the lecturing you kept on to me; he has a turn for the drop, Ellen; you know he has."

"How spitefully you said that!" replied Ellen; "and it isn't generous to spake of it when he's not here to defend himself."

"You'll not let a word go against him," said Michael. "No," she said, "I will never let ill be spoken of an absent friend. I know he has a turn for the drop, but I'll cure him."

"After he's married," observed Michael, not very good-naturedly.

"No," she answered, "*before*. I think a girl's chance of happiness is not worth much who trusts to *after*-marriage reformation. *I wont*. Didn't I reform you, Mike, of the shockin' habit you had of putting every thing off to the last! and after reforming a brother, who knows what I may do with a lover! Do you think that Larry's heart is harder than *yours*, Mike! Look what fine vegetables we have in our garden now, all planted by your own hands when you come home from work—planted during the very time which you used to spend in leaning against the door cheek, or smoking your pipe, or sleeping over the fire; look at the money you got from the Agricultural Society."

"That's yours, Ellen," said the generous-hearted Mike; "I'll never touch a penny of it; but for you I never should have had it; I'll never touch it."

"You never shall," she answered; "I've laid it every penny out, so that when the young bride comes home, she'll have such a house of comforts as are not to be found in the parish—white table-cloths for Sunday, a little store of tay and sugar, soap, candles, starch, every thing good, and plenty of it."

"My own dear generous sister," exclaimed the young man.

"I shall ever be your sister," she replied, "and hers too. She's a good *colleen*, and worthy my own Mike, and that's more than I would say to 'ere another in the parish. I wasn't in earnest when I said you'd be glad to get rid of me; so put the pouch, every bit of it, off yer handsome face. And hush!—whist! will ye! there's the sound of Larry's footstep in the bawn—hand me the needles, Mike." She braided back her hair with both hands, arranged the red ribbon, that confined its luxuriance, in the little glass that hung upon a nail on the dresser, and, after composing her arch laughing features into an expression of great gravity, sat down, and applied herself with singular industry to take up the stitches her brother had dropped, and put on a look of right-*raidenly* astonishment when the door opened, and Larry's good-humoured face entered with the salutation of "God save all here!" He popped his head in first, and, after gazing round, presented his goodly person to their view; and a pleasant view it was, for he was of genuine Irish bearing and beauty—frank, and manly, and fearless-looking. Ellen, the wicked one, looked up with well-feigned astonishment, and exclaimed, "Oh, Larry, is it you, and who would have thought of seeing you this blessed night!—ye're lucky—just in time for a bit of supper after your walk across the moor. I cannot think what in the world makes you walk over that moor so often; you'll get wet feet, and yer mother 'ill be forced to nurse you. Of all the walks in the county, the walk across that moor's the dreariest, and yet ye're always going it! I wonder you havn't better sense; ye're not such a chicken now."

"Well," interrupted Mike, "it's the women that bates the world for deaving. Sure she heard yer step when nobody else could; its echo struck on her heart, Larry—let her deny it; she'll make a shove off if she can; she'll twist you, and twirl you, and turn you about, so that you wont know whether it's on your head or your heels ye're standing. She'll tossicate yer brains in no time, and be as composed herself as a dove on her nest in a storm. But ask her, Larry, the straightforward question, whether she heard you or not. She'll tell no lie—she never does."

Ellen shook her head at her brother, and laughed. And immediately after, the happy trio sat down to a cheerful supper.

Larry was a good tradesman, blythe, and "well to do" in the world; and had it not been for the one great fault—an inclination to take the "least taste in life more" when he had already taken quite enough—there could not have been found a better match for good, excellent Ellen Murphy, in the whole kingdom of Ireland. When supper was finished, the everlasting whisky bottle was produced, and Ellen resumed her knitting. After a time, Larry pressed his suit to Michael for the industrious hand of his sister, thinking, doubtless, with the natural self-conceit of all *mankind*, that he was perfectly secure with Ellen; but though Ellen loved, like all my fair countrywomen, *well*, she loved, I am sorry to say, unlike the generality of my fair countrywomen, *wisely*, and reminded her lover that she had seen him intoxicated at the last fair of Rath-coolin.

"Dear Ellen!" he exclaimed, "it was 'only a drop,' the least taste in life that overcame me. It overtook me unknowst, quite against my will."

"Who poured it down yer throat, Larry?"

"Who poured it down my throat is it? why, myself, to be sure; but are you going to put me to a three months' penance for that?"

"Larry, will you listen to me, and remember that the man I marry must be converted before we stand before the priest. I have no faith whatever in conversions after!"

"Oh, Ellen!" interrupted her lover.

"It's no use oh Ellening me," she answered quickly;

"I have made my resolution, and I'll stick to it."

"She's as obstinate as ten women!" said her brother.

"There's no use in attempting to contradict her; she always has had her own way."

"It's very cruel of you, Ellen, not to listen to reason. I tell you a tablespoonful will often upset me."

"If you know that, Larry, why do you take the table-spoonful?"

Larry could not reply to this question. He could only plead that the drop got the better of him, and the *temptation*, and the *overcomingness* of the thing, and it was very hard to be at him so about a trifle.

"I can never think a thing a trifle," she observed, "that makes you so unlike yourself; I should wish to respect you always, Larry, and in my heart I believe no woman ever could respect a drunkard. I don't want to make you angry; God forbid you should ever be one, and I *know* you are not one yet; but sin grows mighty strong upon us without our knowledge. And no matter what indulgence leads to bad; we've a right to think any thing that *does* lead to it sinful in the prospect, if not at the present."

"You'd have made a fine priest, Ellen," said the young man, determined, if he could not reason, to laugh her out of her resolve.

"I don't think," she replied, archly, "if I was a priest, that either of you would have liked to come to me to confession."

"But Ellen, dear Ellen, sure it's not in positive downright *earnest* you are; you can't think of putting me off on account of that unlucky drop, the *least taste in life* I took at the fair. You could not find it in your heart. Speak for me, Michael, speak for me. But I see it's joking you are. Why, Lent 'ill be on us in no time, and then we must wait till Easter—it's easy talking."

"Larry," interrupted Ellen, "do not you talk yourself into a passion; it will do no good; none in the world. I am sure you love me, and I confess before my brother it will be the delight of my heart to return that love, and make myself worthy of you, if you will only break yourself of that one habit, which you qualify to your own undoing, by fancying, because the *least taste in life* makes you what you ought not to be, that you may still take it."

"I'll take an oath against the whisky, if that will please ye, till Christmas."

"And when Christmas comes, get twice as tipsy as ever, with joy to think yer oath is out—no!"

"I'll swear any thing you please."

"I don't want you to swear at all; there is no use in a man's taking an oath he is anxious to have a chance of breaking. I want your reason to be convinced."

"My darling Ellen, all the reason I ever had in my life is convinced."

"Prove it by abstaining from taking even a drop, even the least drop in life, if that drop can make you ashamed to look your poor Ellen in the face."

"I'll give it up altogether."

"I hope you will one of these days, from a conviction that it is really bad in every way; but not from cowardice, not because you dar'n't trust yourself."

"Ellen, I'm sure ye've some English blood in yer veins, ye're such a reasoner. Irish women don't often throw a boy off because of a drop; if they did, it's not many marriage duels his Reverence would have, winter or summer."

"Listen to me, Larry, and believe, that, though I spake this way, I regard you truly; and if I did not, I'd not take the trouble to tell you my mind."

"Like Mick Brady's wife, who, whenever she thrashed him, cried over the blows, and said they were all for his good," observed her brother slyly.

"Nonsense!—listen to me, I say, and I'll tell you why I am so resolute. It's many a long day since, going to school, I used to meet—Michael minds her, too, I'm sure—an old bent woman; they used to call her the Witch of Ballaghton. Stacy was, as I have said, very old entirely, withered and white headed, bent nearly double with age, and she used to be ever and always muddling about the streams and ditches, gathering herbs and plants, the girls said to work charms with; and at first they used to watch, rather far off, and if they thought they had a good chance of escaping her tongue and the stones she flung at them, they'd call her an ill name or two, and sometimes, old as she was, she'd make a spring at them sideways like a crab, and howl, and hoot, and scream, and then they'd be off like a flock of pigeons from a hawk, and she'd go on disturbing the green-coated waters with her crooked stick, and muttering words which none, if they heard, could understand. Stacy had been a well-rared woman, and knew a dale more than any of us; when not tormented by the children, she was mighty well spoken, and the gentry thought a dale about her more than she did about them; for she'd say there wasn't one in the country fit to tie her shoe, and tell them so, too, if they'd call her any thing but Lady Stacy, which the *rale* gentry of the place all humoured her in; but the upstarts, who think every civil word to an inferior is a pulling down of their own dignity, would turn up their noses as they passed her, and maybe she didn't bless them for it.

One day Mike had gone home before me, and, coming down the back bohren, who should I see moving along it but Lady Stacy; and on she came muttering and mumbling to herself till she got near me, and as she did, I heard Master Nixon (the dog man's) hound in full cry, and seen him at her heels, and he over the hedge encouraging the baste to tear her in pieces. The dog soon was up with her, and then she kept him off as well as she could with her crutch, cursing the entire time, and I was very frightened, but I darted to her side, and, with a wattle I pulled out of the hedge, did my best to keep him off her.

Master Nixon cursed at me with all his heart, but I wasn't to be turned off that way. Stacy, herself, laid about with her staff, but the ugly brute would have finished her, only for me. I don't suppose Nixon meant that, but the dog was savage, and some men, like him, delight in cruelty. Well, I beat the dog off; and then I had to help the poor fainting woman, for she was both faint and hurt. I didn't much like bringing her here, for the people said she wasn't lucky; however, she wanted help, and I gave it. When I got her on the floor, I thought a drop of whisky would revive her, and, accordingly, I offered her a glass. I shall never forget the venom with which she dashed it on the ground.

"Do you want to poison me," she shouted, "after saving my life?" When she came to herself a little, she made me sit down by her side, and fixing her large grey eyes upon my face, she kept rocking her body backwards and forwards, while she spoke, as well as I can remember—what I'll try to tell you—but I can't tell it as she did—that wouldn't be in nature. "Ellen," she said, and her eyes fixed in my face, "I wasn't always a poor lone creature, that every ruffian who walks the country dare set his cur at. There was full and plenty in my father's house when I was young, but before I grew to womanly estate, its walls were bare and roofless. What made them so?—drink!—whisky! My father was in debt; to kill thought, he tried to keep himself so that he could not think; he wanted the courage of a man to look his danger and difficulty in the face, and overcome it; for,

Ellen, mind my words, the man that will look debt and danger steadily in the face, and resolve to overcome them, *can do so*. He had not means, he said, to educate his children as became them: he grew not to have means to find them or their poor patient mother the proper necessities of life, yet he found the means to keep the whisky cask flowing, and to answer the bailiffs' knocks for admission by the loud roar of drunkenness, mad, as it was wicked. They got in at last, in spite of the care taken to keep them out, and there was much fighting, ay, and blood spilt, but not to death; and while the riot was a-foot, and we were crying round the death-bed of a dying mother, where was he?—they had raised a tennagallon cask of whisky on the table in the parlour, and astride on it sat my father, flourishing the huge powder funnel in one hand, and the black jack streaming with whisky in the other; and amid the fumes of hot punch that flowed over the room, and the cries and oaths of the fighting drunken company, his voice was heard swearing "he had lived like a king, and would die like a king!"

"And your poor mother?" I asked.

"Thank God! she died that night—she died before worse came; she died on the bed that, before her corpse was cold, was dragged from under her—through the strong drink—through the badness of him who ought to have saved her; not that he was a bad man either, when the whisky had no power over him, but he could not bear his own reflections. And his end soon came. He didn't die like a king; he died smothered in a ditch, where he fell; he died, and was in the presence of God—how? Oh, there are things that have had whisky as their beginning and their end, that make me as mad as ever it made him! The man takes a drop, and forgets his starving family; the woman takes it, and forgets she is a mother and a wife. It's the curse of Ireland—a bitterer, blacker, deeper curse than ever was put on it by foreign power or hard-made laws!"

"God bless us!" was Larry's half-breathed ejaculation.

"I only repeat ould Stacy's words," said Ellen; "you see I never forgot them. 'You might think,' she continued, 'that I had had warning enough to keep me from having any thing to say to those who war too fond of drink, and I thought I had; but, somehow, Edward Lambert got round me with his sweet words, and I was lone and unprotected. I knew he had a little fondness for the drop; but in him, young, handsome, and gay-hearted, with bright eyes and sunny hair, it did not seem like the horrid thing which *had made me shed no tear over my father's grave*. Think of that, young girl: the drink don't make a man a beast at first, but it will do so before it's done with him—it will do so before it's done with him. I had enough power over Edward, and enough memory of the past, to make him swear against it, except so much at such and such a time, and for a while he was very particular; but one used to entice him, and another used to entice him, and I am not going to say but I might have managed him differently; I might have got him off it—gently, may be; but the pride got the better of me, and I thought of the line I came of, and how I had married him who wasn't my equal, and such nonsense, which always breeds disturbance betwixt married people; and I used to rave, when, may be, it would have been wiser if I had reasoned. Any way, things didn't go smooth—not that he neglected his employment: he was industrious, and sorry enough when the fault was done; still he would come home often the worse for drink—and now that he's dead and gone, and no finger is stretched to me but in scorn or hatred, I think may be I might have done better; but, God defend me, the *last* was hard to bear." Oh, boys!" said Ellen, "if you had only heard her voice when she said *that*, and seen her face—poor ould Lady Stacy, no wonder she hated the drop, no wonder she dashed down the whisky."

"You kept this mighty close, Ellen," said Mike; "I never heard it before."

"I did not like coming over it," she replied; "the last is hard to tell." The girl turned pale while she spoke, and Lawrence gave her a cup of water. "It must be told," she said; "the death of her father proved the effects of deliberate drunkenness. What I have to say, shows what may happen from being even once unable to think or act."

"I had one child," said Stacy, "one, a darlint, blue-eyed, laughing child. I never saw any so handsome, never knew any so good. She was almost three years ould, and he was fond of her—he said he was, but it's a quare fondness that destroys what it ought to save. It was the Pattern of Lady-day, and well I knew that Edward would not return as he went; he said he would, he almost swore he would; but the promise of a man given to drink has no more strength in it than a rope of sand. I took sulky, and wouldn't go; if I had, may be it would not have ended so. The evening came on, and I thought my baby breathed hard in her cradle; I took the candle and went over to look at her; her little face was red; and when I laid my cheek close to her lips so as not to touch them, but to feel her breath, it was hot—very hot; she tossed her arms, and they were dry and burning. The measles were about the country, and I was frightened for my child. It was only half a mile to the doctor's; I knew every foot of the road; and so leaving the door on the latch, I resolved to tell him how my darlint was, and thought I should be back before my husband's return. Grass, you may be sure, didn't grow under my feet. I ran with all speed, and wasn't kept long, the Doctor said—though it seemed long to me. The moon was down when I came home, though the night was fine. The cabin we lived in was in a hollow; but when I was on the hill, and looked down where I knew it stood a dark mass, I thought I saw a white light fog coming out of it; I rubbed my eyes, and darted forward as a wild bird flies to its nest when it hears the scream of the hawk in the heavens. When I reached the door, I saw it was open; the fume cloud came out of it, sure enough, white and thick; blind with that and terror together, I rushed to my child's cradle. I found my way to that, in spite of the burning and the smothering. But Ellen—Ellen Murphy, my child, the rosy child whose

breath had been hot on my cheek only a little while before, she was nothing but a cinder. Mad as I felt, I saw how it was in a minute. The father had come home, as I expected; he had gone to the cradle to look at his child, had dropt the candle into the straw, and, unable to speak or stand, had fallen down and asleep on the floor not two yards from my child. Oh, how I flew to the doctor's with *what* had been my baby; I tore across the country like a banshee; I laid it in his arms; I told him if he didn't put life in it, I'd destroy him and his house. He thought me mad; for there was no breath, either cold or hot, coming from its lips *then*. I couldn't kiss it in death; *there was nothing left of my child to kiss*—think of that! I snatched it from where the doctor had laid it; I cursed him, for he looked with disgust at my purty child. The whole night long I wandered in the woods of Newtownbarry with that burden at my heart."

"But her husband, her husband!" inquired Larry in accents of horror; "what became of him?—did she leave him in the burning without calling him to himself?"

"No," answered Ellen; "I asked her, and she told me that her shrieks she supposed roused him from the suffocation in which he must but for them have perished. He staggered out of the place, and was found soon after by the neighbours, and lived long after, but only to be a poor heart-broken man, for she was mad for years through the country; and many a day after she told me that story, my heart trembled like a willow leaf. 'And now, Ellen Murphy,' she added, when the end was come, 'do ye wonder I threw from yer hand as poison the glass you offered me? And do you know why I have told you what tares my heart to come over?—because I wish to save you, who showed me kindness, from what I have gone through. It's the only good I can do ye, and, indeed, it's long since I cared to do good. Never trust a drinking man; he has no guard on his words, and will say that of his nearest friend, that would destroy him soul and body. His breath is not as the breath of the plague; his tongue is a foolish, as well as a fiery serpent. Ellen, let no drunkard become your lover, and don't trust to promises; try them, prove them all, before you marry.'"

"Ellen, that's enough," interrupted Larry. "I have heard enough—the two proofs are enough without words. Now, hear me. What length of punishment am I to have? I won't say that, for, Nell, there's a tear in your eye that says more than words. Look—I'll make no promises—but you shall see; I'll wait yer time; name it; I'll stand the trial."

And I am happy to say, for the honour and credit of the country, that Larry did stand the trial—his resolve was fixed; he never so much as tasted whisky from that time, and Ellen had the proud satisfaction of knowing she had saved him from destruction. They were not, however, married till after Easter. I wish all Irish maidens would follow Ellen's example. Woman could do a great deal to prove that "*the least taste in life*" is a great taste too much!—that "*ONLY A DROP*" is a temptation fatal if unresisted.

WALKS IN THE BRITISH MUSEUM.

ROOM OF EGYPTIAN ANTIQUITIES.

No portion of the contents of this great national collection arrests the attention of visitors more forcibly than the relics of ancient Egypt. These remarkable works of art may in general be assumed as above three thousand years old; and that objects of such extreme antiquity should still exist, and be actually shown in England, is one of the most interesting facts which could possibly be mentioned. The cause for the preservation of these ancient relics till the present day, is matter familiar to the world. The inhabitants of Egypt, in the days of its former glory, followed a peculiar custom of embalming the bodies of the dead, of placing these bodies or mummies in carved and painted coffins of stone and wood, of wrapping up along with the bodies objects of art and veneration; and, in short, of making the tombs great receptacles of every species of things which were used in their communities. Possessing extraordinary skill in the use of the chisel and the pencil, they covered the insides of many of their tombs and temples with paintings and sculptures, which represent the military customs, manufacturing operations, and domestic arts, of ancient Egypt; and implements have been also found in great quantities, which bear upon and elucidate the same subject. Until within the last few years, comparatively little had been done to explore the tombs and temples of Egypt; but this having now been effected on an extensive scale, the result has been the importation to England and other European countries of an immense variety of ancient objects of art, so that those curious in such things have an opportunity of forming almost as complete an idea of the state of Egyptian civilisation two or three thousand years ago, as they could of that of any nation at the present day. Since the arrival of these valuable stores in England, the greater proportion of them have been placed in the British Museum, where, arranged in different large halls, they may be freely inspected by visitors.

In the lower halls of one wing of the Museum are placed the principal remains of Egyptian sculpture, consisting of sarcophagi, or huge stone coffins of various shapes, colossal statues of deities and kings, with many monstrous figures, half-human and half-bestial,

* Tax-gatherers were so called some time ago in Ireland, because they collected the duty on dogs.

† In the house.

inscribed slabs, friezes, and bas-reliefs, all of them of massive size, and cut from the solid rock. These objects, however, are more calculated to astonish the eye than to enlighten the mind respecting the extraordinary nation from whom they proceeded. Not so in the case of the lighter or purely domestic antiquities of the same country. These are arranged in a large room in the upper part of the building, which is lighted from the roof, and the walls of which are lined with glass-cases, containing the objects in question, and thus presenting them to the eyes of visitors. A number of mummy coffins or cases occupy the centre of the apartment, along with stands having glass frames upon them, through which are seen various smaller objects of Egyptian art.

The case to which we shall first advert, contains some interesting specimens of the bricks used by the Egyptians in the erection of their houses. They are in different states with respect to hardness, but all are in a very perfect condition. They are about the same size as the bricks employed in modern building, and have the dunish grey colour of the common dried mud or clay of this country. The process of baking, being conducted merely by exposing them to the sun, made comparatively little change on them in colour. The whole process of brick-making is delineated in some of the paintings at Thebes, where slaves, under the command of "taskmasters," are seen digging up the mud, mixing it with water brought from a tank, shaping the bricks by placing them in wooden moulds, and finally carrying them in a perfect state to the taskmasters. It is observable that the specimens of bricks in the Museum are stamped with some hieroglyphical figures, which renders it probable that the Egyptian rulers had taken the brick manufacture into their own hands, and turned it to a source of revenue, keeping the trade out of the hands of private persons by means of these stamps. It appears that in some instances bricks were made with a small mixture of straw in the clay, for the purpose of giving adhesiveness to the mass, upon the same principle that hair is infused into plaster. Hence the meaning of the complaint made by the captive Israelites of being obliged to make bricks without straw. As many Egyptian bricks are found without any sensible appearance of straws in their composition, it has been doubted whether there were in reality any such process of mixture; but the exhibition of a brick with straws still existing in its mass, is an incontestible evidence that at least in some instances—probably those in which the clay was not very adhesive—straws were used in making bricks in Egypt.

It would scarcely be anticipated that the British Museum should contain an Egyptian house, but it really possesses the next thing to that, namely, a wooden model of a house. This very curious object was brought from Egypt by Mr Salt, and is about a foot in height, by nearly twice the length. It is a model of one of the very humblest kinds of dwelling-houses or cots, calculated for a small family. It partly resembles a lidless box, more than half of the interior of it being devoted to the purpose of an open courtyard. The other half is covered over, and the shut up space is divided within, into three or four small rooms. On the top of these rooms is a sort of balcony or terrace, which is reached by a staircase from the court, and which terminates at one end in a small open chamber, forming the highest part of the model. As this upper room seems to have been too small and too much exposed to serve as a place for living or sleeping in, the rooms below, which open into the courtyard, must have been in part applied to these purposes, although, when the model was first found, these apartments in it were entirely filled with grain, as if they had been store-rooms. The court has a door which turns upon two pins in place of hinges, one above and one below, and is secured by a bar running through two staples, which was the usual way of securing doors. The figure of a woman engaged in rolling out something like bread in the court, shows that place to have been the scene of most domestic operations. This model gives an idea of all the Egyptian dwellings—an enclosing wall, a court in the interior, with the house or habitable apartments on one or both sides of it, or around it altogether.

Of the furniture of the houses, numerous specimens are presented to us in the cases of the Museum. Upwards of three thousand years ago, the seats, tables, and other conveniences of the Egyptian dwellings, seem to have been fully more rich and luxurious than any thing to be seen in modern times. Although by far the finest specimens of such articles are to be found in the paintings of the Theban tombs, yet the collection in the Bri-

tish Museum contains remains sufficiently beautiful and well preserved to bear out the preceding assertion. The finest of the relics there is a large stool, resembling a chair without a back. It is of ebony, finely inlaid with ivory, and stands upon four legs, connected with one another by numerous crossing spars of ebony. From each of the four corners, the bottom of the chair tapers away downwards and inwards, making the resting-place a gentle hollow, in which a soft cushion was placed. There are other stools of common wood with upright legs, and of square form; but, what is more remarkable, Mr Salt brought home a stool with crossing legs, exactly the same as our camp-stool, and folding up in the very same way. This stool is of common wood, and wants the seat, whether of withes or leather, which no doubt originally belonged to it. Every one must regard this Egyptian camp-stool as a most remarkable proof how often we are merely returning to antique usages and inventions, when we imagine ourselves striking out ideas perfectly new and original.

We next have our attention attracted to a chair which occupies a prominent situation in the same case as the foregoing objects of household use. This most ancient specimen of Egyptian carpentry closely resembles a common deal chair of modern times, such, for instance, as is usually to be seen in kitchens, or in the cottages of our peasantry. The only peculiarity in the construction consists of a frame of spars sloping from the seat to about the middle of the upright back, so that a person in sitting might conveniently lean backward, and have a certain degree of support to the lower part of the spine. Trifling as this peculiarity may appear, we accept it as an evidence of the advanced state of intelligence among the ancient Egyptians. In our own times there are only a few original inquirers into the functions of the animal frame, who have pointed out the necessity for giving support to the spine in nearly its whole length while sitting; this, then, the mechanics of Egypt understood three thousand years ago. It is further of some little moment to observe, that this Egyptian chair is precisely of the same height of legs and seat from the ground as our modern chairs, from which we may understand that mankind are of the same bodily stature that ever they were. The height of doors and of stools and chairs, also the length of stone coffins and the skeletons of mummies, all prove this important fact. These, therefore, who feel any alarm for the physical degeneracy of mankind, may rest quite contented, on learning from the sight of these exhumed relics that the human frame is just as bulky and stout as ever it was. The Pharaohs, and other worthies of those times, measured no more than from five feet to five feet eight or ten inches, the ladies being shorter in proportion.

A curious article in one of the Museum cases gives an insight into an odd custom of the Egyptians. This is a head-stool, or hollowed piece of wood raised upon legs like a stool, which was used as a pillow for resting the head upon during the hours of sleep. Why the Egyptians should have indulged their bodies with luxurious couches for resting-places, and at the same time mortified their heads, is not easily understood, but ancient authors confirm the evidence afforded by these relics, of the reality of the practice. Foot-stools as well as head-stools have been brought from Egypt, but not of a fine or elegant kind. No perfect specimen of the carpeting or matting used for the floors of the Egyptian rooms, seems to have been found among the ruins of the country. But from the skill exhibited in the plaiting of the sandals, baskets, and chair-bottoms, contained in the Museum, there can be little doubt that they would at least have elegant mats beneath their feet. Some fragments of worsted stuff found at Thebes have led to the supposition that they had even carpets like our own.

Various specimens of the articles used in the Egyptian dressing-rooms, are to be seen in the cases of the British Museum. Among these the metallic mirrors or looking-glasses are not the least remarkable. The metal used in their manufacture was a particular alloy of copper, which the Egyptians had discovered to be admirably fitted for receiving a polish. The three or four mirrors of this kind in the Museum, are of a circular shape, and vary from about three to six inches in diameter. They are provided with short handles, of wood or metal, being intended to be held up in the hand during use. These handles are fanciful in shape, and have been ornamented with various figurings. One cannot look at one of these articles without having the thoughts sent back over the immense intervening period of time, to the days when its smooth and glittering surface reflected the dusky charms of some young and beautiful daughter of Egypt. Ages have passed away, and the inanimate matter, which man calls perishable, is still existent, while the nobler thing, the breathing being, whose passing look this mirror was but made to reflect, has long passed away, and left not a shadow of a trace upon earth.

Similar reflections arise at the sight of the combs in the Museum, which have doubtless parted the locks of the maidens of Thebes in far distant days. Though the Egyptians were so well acquainted with working in ivory as to render it probable that they used that substance in the manufacture of their finest combs, yet those alluded to are all made of wood. They are three or four inches in length, with teeth about one inch long, and more or less fine and numerous in different instances. The wood is of a brownish hue, and is supposed to be from the acacia, or that hard spinous tree which produces gum-arabic. Pins and needles

are also articles of the Egyptian toilet which have been discovered and preserved, though not in any great quantities, as indeed was scarcely to be expected. The pins have generally gold knobs or heads, and probably were as much employed for binding the hair as for any other purpose. The women always wore their own hair. The men, on the contrary, had an universal custom of shaving their heads and wearing artificial hair; and there is in the British Museum one of the greatest curiosities that a modern eye can look upon, in the shape of an ancient Egyptian wig. It was brought from a tomb near the temple of Isis at Thebes, and is about a foot and a half in length, and of considerable amplitude, being calculated seemingly for one of the largest of human heads. The upper part of the hair is in curl, and the sides and lower part in neat and numerous plaits. But for its being partly plaited, this wig would very much resemble those of Charles the Second's time, which every one must have seen exemplified in such portraits as those of the Duke of Lauderdale and Lord William Russell. This fine specimen of antique head-gear is in perfect preservation, and looks almost as if it had newly left a block in Bond Street. Many ancient authors notice this Egyptian practice of shaving the head and wearing false hair, and it is ascribed to the desire of protecting that part of the body from the heat of the climate. Indeed, the custom must have conducted greatly to coolness, as all who have tried a wig under similar circumstances concur in admitting. The heavy head-dress which is seen on almost every one of the Egyptian busts and statues, is intended to represent these wigs, and the long parallel grooves, or rather ridges, carved in the stone, are figurative of the plaits into which the hair was wrought. Even the sphinxes, or imaginary quadrupeds with human heads, are usually gifted with the plaited wig of stone, both in ancient and modern sculptures. When the luxury of false hair could not be afforded, woollen wigs were substituted by the Egyptians. The very poorest classes wore caps, but the whole male population adhered to the custom of shaving the head, except at times of mourning, when they let the hair grow, both on the head and chin. The courtiers of Charles the Second's time, when they prided themselves upon adopting the novel continental fashion of wearing massive wigs, little thought they were merely returning to the venerable dandyism of Thebes. Do the solar rays really shine upon any thing new?

The cases of the Museum contain various specimens of the articles worn upon the feet in ancient Egypt. Sandals, or simple protections for the sole of the foot, kept on by ties or laces, were undoubtedly the oldest forms of this part of dress, and of these we find several specimens, constructed of palm-leaves plaited neatly together, and shaped to the sole of the foot. Some of those in the Museum have their toes turned up, after the fashion common in eastern countries at this day, and particularly, as is well known, in China. A tie round the instep, joined by one from the toe, with another round the ankle, kept the sandal firmly in its place. Some sandals had wrought sides, like ordinary shoes. In the Museum there are three or four specimens of leather shoes, but not in very good preservation. Their hue is greenish, their form clumsy, and the sewing rough and rude. Some of them want the fore part or upper leather; but the deficiency seems to have been partly made up by the turned points, which, as the soles are very thin and slight, might be pulled back by laces, so as to cover the foot anteriorly. The shoes most nearly resembling modern ones are a pair of children's shoes, which one might justifiably presume to have been intended for an infant of this day. Upon the whole, the sight of these articles convinces one that the sandal must have been a much neater protection for the foot than the shoe, at least as the Egyptians made the latter article. With their skill in dyeing, the sandal would doubtless be made highly ornamental as well as serviceable.

Certain other articles of house-furniture, of which curious specimens exist in the Museum, may here be noticed. The boxes in which the Egyptians kept their small articles of value were sometimes of a beautiful description, if we may judge from one box brought home by Mr Salt, and which is of considerable size. It is in shape a parallelogram, and its top consists of two parts, which meet in the centre, and incline to each other like the roof of a house. All the edges of this box are inlaid with pieces of ivory, of lozenge or diamond shape. These are stained or painted red and blue, and, retaining all the original brightness of their tints, would render the box a fit ornament for the most splendid of modern mansions. Another box of nearly the same shape, but not brilliantly veneered, has a number of figures painted on its sides, representing the members of a family bringing offerings to the parents, with other devices and hieroglyphical figures. These boxes are nearly of the trunk size; but Mr Salt also brought from Egypt a great number of smaller boxes, fitted for holding ointments, paints, or the minor appurtenances of a lady's toilette-table. These boxes are generally of fine wood, such as sycamore, and are cut into all manner of fanciful shapes. Some of them are in the form of a fish, others of a duck, and others in more odd and fantastic forms, while some have handles that are also in the form of animals. The interior of the box most commonly resembles a cup or saucer, and the lid turns aside on a pin. They are besides elaborately decorated with various figures and devices, carved or painted. The genius of the people

had led them to expend an inconceivable amount of pains on the ornamenting of these and similar little articles, and the result must have been a degree of elegance in the interior of their houses, such as no country on the face of the earth has probably ever yet seen exceeded.

RICHARD PARKER, THE MUTINEER.

In the year 1797, when the threatening aspect of affairs abroad made the condition of her naval force a matter of vital consequence to Britain, several most alarming mutinies broke out among the various fleets stationed around the shores of the country. In April of the year mentioned, the seamen of the grand fleet lying at Portsmouth disowned the authority of their officers, seized upon the ships, and declared their determination not to lift an anchor, or obey any orders whatsoever, until certain grievances of which they complained were redressed. After some delay, satisfactory concessions were made to them by the government, and the men returned to their duty. But the spirit of insubordination had spread among other squadrons in the service, and about the middle of May, immediately after the Portsmouth fleet had sailed peacefully for the Bay of Biscay, the seamen of the large fleet lying at the Nore broke also into open mutiny. The most prominent personage in this insurrection was an individual named Richard Parker, whose history it is our special object in this paper to lay before the reader.

Richard Parker was a native of Exeter, where he was born about the year 1765 or 1766. His father was a reputable tradesman, and kept a baker's shop at St Sidwell's, in the bounds of the city mentioned. Young Parker received an excellent education, and in the course of time went to sea, which he had chosen as the scene of his future career. He served for a considerable period in the royal navy as midshipman and master's mate, and at one period also, it is said, held the post of lieutenant. He appears to have given up the naval profession on his marriage with Miss Ann Machardy, a young lady resident in Exeter, but of Scottish origin, being a member of a respectable family in the county of Aberdeen. This connection led Parker to remove to Scotland, where he embarked in some mercantile speculations that proved unsuccessful. The issue was, that he ere long found himself involved in difficulties, and without the means to maintain his wife and two children. In Edinburgh, where these embarrassments fell upon him, he had no friends to apply to, and, in a moment of desperation, he took the king's bounty, and became a common sailor on board a tender at Leith. When he communicated to his wife the step he had taken, she was in the greatest distress, and resolved to set off instantly for Aberdeen, in order to procure from her brother there the means of hiring two seamen as substitutes for her husband. Though successful in raising the necessary funds, no time was allowed her to complete her project. On her return from Aberdeen, she was only in time to see the tender sail for the Nore, with her husband on board. Her grief on this occasion was bitterly aggravated by the death of one of her children. Parker's sufferings were shown to be equally acute by his conduct when the vessel sailed. Exclaiming that he saw the body of his child floating on the waves, he leapt overboard, and was with difficulty rescued and restored to life.

It was in the beginning of May 1797 that Parker reached the Nore, or point of land dividing the mouths of the Thames and the Medway. Probably on account of his former experience and station as a seaman, he was drafted on board the Sandwich, which was the guard-ship, and bore the flag of Admiral Buckner, the port-admiral. The mutinous spirit which afterwards broke out, certainly existed on board of the Nore squadron before Parker's arrival. Communications were kept up in secret between the various crews, and the mischief was gradually drawing to a head. But though he did not originate the feeling of insubordination, the ardent temper, boldness, and superior intelligence of Parker, soon became known to his comrades, and he became a prominent man among them. Their plans being at length matured, the seamen rose simultaneously against their officers, and deprived them of their arms, as well as of all command in the ships, though behaving respectfully to them in all other respects. Each vessel was put under the government of a committee of twelve men, and, to represent the whole body of seamen, every man-of-war appointed two delegates, and each gun-boat one, to act for the common good. Of these delegates Richard Parker was chosen president, and, in an unhappy hour for himself, he accepted of the office. This representative body drew up a list of grievances, of which they demanded the removal, offering to return immediately afterwards to their duty. It is unnecessary to specify these demands further, than that they related to increase of pay and provisions, a more equal division of prize-money, liberty to go on shore, proper payment of arrears, and other points of naval discipline. A committee of naval inquiry subsequently granted almost all that was demanded, thereby acknowledging the general justice of the complaints made. Parker signed these documents, and they were published over the whole kingdom with his name, as well as presented to Port-admiral Buckner, through whom they were sent to government.

When these proceedings commenced, the mutineers

were suffered to go on shore, and they paraded about Sheerness, where a part of the fleet lay, with music, flags (red in colour—the customary hue of insubordination), and other appendages of a triumphal procession. But, on the 22d of May, troops were sent to Sheerness to put a stop to this indulgence. Being thus confined to their ships, the mutineers, having come to no agreement with Admiral Buckner, began to take more decisive measures for extorting compliance with their demands, as well as for insuring their own safety. The vessels at Sheerness moved down to the Nore, and the combined force of the insurgents, which at its greatest height consisted of twenty-four sail, proceeded to block up the Thames, by refusing a free passage, up or down, to the London trade. Foreign vessels, and a few small craft, were suffered to go by, first receiving a passport, signed by Richard Parker as president of the delegates. In a day or two the mutineers had an immense number of vessels under detention. The mode in which they kept these was as follows. The ships of war were ranged in a line, at considerable distances from each other, and in the interspaces were placed the merchant-vessels, having the broadsides of the men-of-war pointed to them. The appearance of the whole assemblage is described as having been at once grand and appalling. The red flag floated from the mast-head of every one of the mutineer ships. It may be well imagined that the alarm of the citizens of London was extreme. The government, however, though unable at the period to quell the insurgents by force, remained firm in their demand of "unconditional submission as a necessary preliminary to any intercourse." This, perhaps, was the very best line of conduct that could have been adopted. The seamen, to their great honour, never seemed to think of assuming an offensive attitude, and were thereby left in quiet to meditate on the dangerous position in which they stood in hostility to a whole country. They grew timorous, the more so, as the government had caused all the buoys to be removed from the mouth of the Thames and the adjacent coasts, so that no vessel durst attempt to move away for fear of running aground. The mutineering vessels held together, nevertheless, till the 30th of May, when the Clyde frigate was carried off through a combination of its officers with some of the seamen, and was followed by the St Fiorenzo. These vessels were fired upon, but escaped up the river.

On the 4th of June, the king's birth-day, the Nore fleet showed that their loyalty to their sovereign was undiminished, by firing a general salute. On the 5th, another frigate left the fleet, but its place was supplied by a sloop and four men-of-war, which had left Admiral Duncan's fleet at the Texel to join the mutiny. On the 6th, Lord Northesk met the delegates by desire on board the Sandwich, and received from them proposals for an accommodation, to which the unfortunate Parker still put his name as president. The answer was a direct refusal, and this firmness seems to have fairly humbled the remaining spirit of the mutineers. From that time one vessel after another deserted the band, and put themselves under the protection of the fort at Sheerness. On the 10th, the merchantmen were allowed by common consent to pass up the river, and such a multitude of ships certainly never entered a port by one tide. By the 12th, only seven ships had the red flag flying, and on the 16th the mutiny had terminated, every ship having been restored to the command of its officers. A party of soldiers went on board the Sandwich, and to them the officers surrendered the delegates of the ship, namely, a man named Davies, and Richard Parker.

Richard Parker, to whom the title of Admiral Parker had been given by the fleet and by the public during the whole of this affair, was the individual on whom all eyes were turned as the ringleader of the mutineers. He was brought singly to trial on the 22d of June, after being confined during the interval in the black-hole of Sheerness garrison. Ten officers, under the presidency of Vice-Admiral Sir Thomas Paisley, composed the court-martial, which sat on board the Neptune, off Greenhithe. The prisoner conducted his own defence, exhibiting great presence of mind, and preserving a respectful and manly deference throughout for his judges. The prosecution on the part of the crown lasted two days, and on the 26th, Parker called witnesses in his favour, and read a long and able defence which he had previously prepared. The line of argument adopted by him was—that the situation he had held had been in a measure forced upon him; that he had consented to assume it chiefly from the hope of restraining the men from excesses; that he had restrained them in various instances; that he might have taken all the ships to sea, or to an enemy's ports, had his motives been disloyal, &c. &c. Parker unquestionably spoke the truth on many of these points. Throughout the whole affair, the injury done to property was trifling, the taking of some flour from a vessel being the chief act of the kind. This was mainly owing to him. But he had indubitably been the head of the mutineers. He was proved to have gone from ship to ship giving orders, and haranguing the men—to have been cheered as he passed along, and treated with the honours of a chief. Nothing could save him. He was sentenced to death. When his doom was pronounced, he stood up, and uttered these words in a firm voice: "I shall submit to your sentence with all due respect, being confident of the innocence of my intentions, and that God will receive me into favour; and I sincerely hope that my death will

be the means of restoring tranquillity to the navy, and that those men who have been implicated in the business may be reinstated in their former situations, and again be serviceable to their country."

On the morning of the 30th of June, the yellow flag, the signal of death, was hoisted on board of the Sandwich, where Richard Parker lay, and where he was to meet his fate. The whole fleet was ranged a little below Sheerness, in sight of the Sandwich, and the crew of every ship was piped to the fore-castle. Parker was awaked from a sound sleep on that morning, and after being shaved, he dressed himself in a suit of deep mourning. He mentioned to his attendants that he had made a will, leaving his wife heir to some property belonging to him. On coming to the deck, he was pale, but perfectly composed, and drank a glass of wine "to the salvation of his soul, and forgiveness of all his enemies!" He said nothing to his mates on the fore-castle but "Good bye to you," and expressed a hope that "his death would be deemed a sufficient atonement, and save the lives of others!" He was strung up to the yard-arm at half-past nine o'clock. A dead silence reigned among the crews around during the ceremony. In closing their account of this affair, the journals of the day state that the body of Parker was put into a shell, and interred, within an hour or two after the execution, in the New Naval Burying Ground at Sheerness. A curious sequel to this account, however, it is now in our power to present to the reader.

Richard Parker's unfortunate wife had not left Scotland, when the rumour came to her ears that the Nore fleet had mutinied, and that the ringleader was one Richard Parker. She could not doubt that this was her husband, and immediately took a place in the mail for London, to save him if possible. On her arrival, she heard that Parker had been tried, but the result was unknown. Being able to think of no way but petitioning the king, she gave a person a guinea to draw up a paper, praying that her husband's life might be spared. She attempted to make her way with this to his majesty's presence, but was obliged finally to hand it to a lord-in-waiting, who gave her the cruel intelligence that all applications for mercy would be attended to, except for Parker. The distracted woman then took coach for Rochester, where she got on board a king's ship, and learnt that Parker was to be executed next day: she sat up, in a state of unspeakable wretchedness, the whole of that night, and at four o'clock in the morning went to the river-side, to hire a boat to take her to the Sandwich, that she might at least bid her poor husband farewell. Her feelings had been deeply agonised by hearing every person she met talking on the subject of her distress, and now, the first waterman to whom she spoke exclaimed, "No! I cannot take one passenger. The brave Admiral Parker is to die to-day, and I will get any sum I choose to ask for a party." Finally, the wretched wife was glad to go on board a Sheerness market-boat, but no boat was allowed to come alongside the Sandwich. In her desperation she called on Parker by name, and prevailed on the boat-people, by the mere spectacle of her suffering, to attempt to go nearer, when they were stopped by a sentinel threatening to fire at them. As the hour drew nigh, she saw her husband appear on deck between two clergymen. She called on him, and he heard her voice, for he exclaimed, "There is my dear wife from Scotland." Immediately afterwards, she fell back in a state of insensibility, and did not recover till some time after she was taken ashore. By this time all was over, but the poor woman could not believe it so. She hired another boat, and again reached the Sandwich. Her exclamation from the boat must have startled all who heard it. "Pass the word," she cried, in her delusion, "for Richard Parker!" The truth was now told to her, and she was further informed that his body had just been taken ashore for burial. She immediately caused herself to be rowed ashore again, and proceeded to the churchyard, but found the ceremony over, and the gate locked. She then went to the admiral and sought the key, which was refused to her. Excited almost to madness by the information that the surgeon would probably disinter the body that night, she waited around the churchyard till dusk, and then, clambering over the wall, readily found her husband's grave. The shell was not buried deep, and she was not long in scraping away the loose earth that intervened between her and the object of her search. She got the lid removed, and then she clasped the cold hand of her husband in her own!

Her determination to possess the body aroused the widow from the enjoyment of this melancholy pleasure. She left the churchyard, and communicated her situation to two women, who, in their turn, got several men to undertake the task of lifting the body. This was accomplished successfully, and at three o'clock in the morning the shell containing the corpse was placed in a van, and conveyed to Rochester, where, for the sum of six guineas, Mrs Parker procured another waggon to convey it to London. On the road they met hundreds of persons, all inquiring about, and talking of the fate of "Admiral Parker." At eleven p.m. the van reached London; but here the poor widow had no private house or friends to go to, and was obliged to stop at the Hlop and Horse-Shoe on Tower-Hill, which was full of people. Mrs Parker got the body into her room, and sat down beside it; but the secret could not be long kept in such a place, more particularly as the news of the exhumation had been

brought by express that day to London. A great crowd, by and by, assembled about the house, anxious to see the body of Parker, which, however, the widow would not permit. The Lord Mayor heard of the affair, and came to ask the widow what she intended to do with her husband's remains. She replied, "To inter them decently at Exeter or in Scotland." The Lord Mayor said that the body would not be taken from her, but prevailed on her to have it decently buried in London. Arrangements were made with this view, and finally the corpse of the unfortunate Parker was inhumed in Whitechapel Churchyard; although not until it had to be removed to Aldgate Workhouse, on account of the crowds attracted by it, and which caused some fears lest "Admiral Parker's remains should create a civil war." After the closing ceremony was over, Mrs Parker, who had in person seen her husband consigned to the grave, gave a certificate that all had been done to her satisfaction. But, though strictly questioned as to the parties who had aided her in the disinterment, she firmly refused to disclose their names.

Parker, as has been said, made a will, leaving to his wife a small property on which he had claims near Exeter. This she enjoyed for a number of years, but ultimately her rights, whether erroneously or not, were decided to be invalid, and she was deprived of the pittance which had formed her maintenance. She was thrown into great distress, and was compelled to solicit assistance from the charitable, having become nearly if not entirely blind. The late King William gave her at one time L.10, and at another L.20. In 1836, the forlorn and miserable condition of poor Parker's widow was made known to the London magistrates, and a temporary refuge was provided for her. But temporary assistance was of little avail to one whose physical infirmities rendered her incapable any longer of helping herself, and again her miserable condition came under the cognisance of the public authorities. An appeal to the charitable has recently been made, by a portion of the daily press, in her favour, but with what success we are unable to say. She is now sixty-nine years of age, blind, and friendless. Time and misfortune have not quenched her affection for the partner of her early days. Of him she yet speaks with all the enthusiasm of youthful affection, and still mourns his fate.

MR S. LAING'S TOUR IN SWEDEN.*

A TOUR in Norway, published about two years ago by Mr Samuel Laing (a brother, we understand, of the late acute historian, Mr Malcolm Laing), was so favourably entertained by the public, that the author has been induced to complete his view of the present condition of the great Scandinavian peninsula by a similar work on Sweden. He visited this country last summer, and spent a few months in perambulating its most interesting districts, and the result has just appeared in the volume now under our notice. Mr Laing is obviously a man of quick apprehension, extensive information, and considerable talents as a writer. The "observations on the moral, political, and economical state of the Swedish nation," which, being mentioned on the title-page, may be presumed to form an important part of his book, are so mixed up with matters less abstract, and have in themselves so little of the dull, that, while they contribute much to the value of the work, they in no respect disqualify it for the popularity to which it is evidently destined.

Mr Laing constructs his work on the principle of a journal—writing it, in fact, as he goes along—thus preferring freshness of impression, with the drawback of possible rashness, to the deliberation of the opposite plan, with the disadvantage of that tameness which, he thinks, must attach to all such productions, when the writer waits till he has become familiarised with every thing that is peculiar to the country. He opens his journal (April 24, 1838) at Hamburg, near which he finds the "royal navy of Hanover" riding at the mouth of the Elbe, in the shape of a cutter of six or eight guns, with the respectable duty of levying eight-pence on every parcel, portmanteau, and package of goods, whatever be the value, which passes up the Elbe. On his way to Keil he remarks on the ruling principle of the continental governments, to take all sorts of business into their own hands—roads, for instance, diligences, steam-vessels, schools, savings' banks, mines, and even manufactures—the result of which is, he thinks, to keep the people in a state of constant pupillage, similar to that of soldiers depending on their officers. In a canoe, formed of a hollowed trunk of a tree, paddled by two women, which lies moored beside a steam-vessel, he sees an expressive proof of the backwardness which a people may manifest in the arts of civilisation, while the government is thus taking all important duties out of their hands. In Denmark he sees the

principle exemplified on a large scale, the machinery for administering public affairs being there of the most perfect kind—far beyond what it is in Britain—while the people nevertheless are two centuries behind the English "in the useful arts, in activity, industry, and well-being." Hence Mr Laing draws the conclusion that it is not what is done for a people, but what a people do for themselves, which acts upon their character and condition. He adds the startling fact that, in Denmark, for every ten of the whole population, there is one of a non-productive class, composed of civil functionaries, priests, soldiery, paupers, and slaves. There is one clergyman to every 276 6-10ths of the people, and one civil functionary to every 176. "If to these perpetual drains on the earnings of the middle and lower classes be added the enormous waste of the capital and time of the country on palaces, gardens, shows, military duties, and such objects as reproduce nothing, it is not extraordinary that the people are sunk in poverty and sloth, although occupying the richest soil and most advantageous situation in the north of Europe."

Passing through a portion of Norway, he enters Sweden at Strand, and soon after has occasion to notice an inscription cut out in a rock by the wayside, "In the years 1772 and 1788, Gustavus III. travelled this way to defend the frontiers; the gratitude of the country will endure as long as the world stands." "It is on the whole fortunate," says Mr Laing, "that the existence of the world has not depended on the gratitude of this part of it." As he advances, he makes the more important observation, that the farm-houses manifest symptoms of decay, want of attention to cleanliness, and other peculiarities, indicating a declining state of things, being the opposite in these respects of the farm-houses of Norway. The wages of labour are also lower in Sweden than in Norway. A bad posting system obtains in the country, by which the farmers of the wayside are compelled to be ready with horses to serve the purposes of travellers. The rate exigible for each horse is about a penny a mile, decidedly an insufficient compensation for the abstraction of horse and man from their proper duties. The effect of this systematic violation of the rights of property on the minds of the people, and the vitiating influences to which the young rustics are exposed in their compulsory attendance at the inns, draw some indignant remarks from our tourist.

Mr Laing finds a great similarity between the language of the Swedes and that of the lowland Scots, many words and even whole sentences being identical. It is also curious to a Scotsman to learn that the names Hamilton, Seaton, Bruce, Maclean, Spens, Montgomery, Murray, and Colquhoun, are common in Sweden, having been introduced there by the auxiliary troops brought in large draughts from Scotland in the sixteenth and seventeenth centuries. At Westeraas we have a striking scene. "A company of soldiers, as I thought from their appearance, of the foot guards, marched into town yesterday, and the captain and six men were billeted upon my landlord. They were remarkably fine-looking grenadiers, well dressed in white round jackets with yellow epaulets and blue trousers, and all their appointments seemed substantial, clean, and soldier-like. Their evening parade upon the street before our door struck me very much. After the roll was called, and the reports and orders delivered, the commanding officer called one of the soldiers out of the ranks, it appeared to me without turn or selection, and the whole company taking off their caps at once, this man repeated the Lord's Prayer, after which they all sang a hymn very beautifully, and the parade was dismissed. This morning early, about two o'clock, the company mustered before the door again to march to their next halting-place before the heat of the day set in. Between sleeping and waking, I heard the same service repeated—the Lord's Prayer and a morning hymn sung, before they marched off. The service was not hurried over. It lasted from fifteen to twenty minutes, and was gone through as slowly and solemnly as in any religious meeting. This is a remnant of the military practice of the great Gustavus Adolphus, which has been retained in the Swedish service since the 'Thirty Years' War."

The fondness of the people for titles attracts Mr Laing's observation even at this early part of his journey. "The taste has spread widely and deeply through society. Madame and Mam'selle are the equivalents for Mrs and Miss; and Fru and Fröken for My Lady and the unmarried My Lady. But you would be grievously out in your good manners if you were to go into a shop and address the mistress as Madame. It is an equal chance that she is My Lady. There are a great many offices merely nominal, which give the rank entitling the man's wife to be called Her Ladyship. I am not yet fully master of this branch of etiquette. In the military line it goes as low as the lieutenant's wife, in the clerical to that of a priest. In civil functions, the landwaiter in the customs, the clerks in public offices, and even the accredited deputies of the clerks, have the felicity of hearing their wives called My Lady; and a whole host of nominal assessors, councillors, and such dignities, have the same rank. I had almost fallen into the inexcusable error of calling a bookbinder's wife Madame, but fortunately my ear caught the word Fru going as glibly as if her husband carried the portefeuille instead of making it. The title of Mam'selle is a degree above that of Jomfru. The barmaid is Mam'selle, but the girl who waits is

only Jomfru; and below the Jomfru, in dignity and title, is the Flikka—the simple girl. This ridiculous vanity," says Mr Laing, in a spirit of the soundest philosophy, "is not so very innocent a foible, if it takes the place of higher and more moral grounds of distinction with the middle classes, and if the people in the ordinary ranks of life come to be gratified with conventional distinctions, not founded on their industry, property, or social worth, in their stations. This false estimate appears very prevalent in Sweden. In reading the little political brochures and speculations of the periodical press, the stranger must be struck with the inordinate importance they give to personal distinctions. The title of Excellence, or the Order of the Seraphim, are stated in their political views as serious objects and motives of action for public men in public affairs. The public mind must be in a state to accept of this as reasonable, or it would not be presented to it. The value of public opinion, of those positions beyond all titles or orders which Pitt, Fox, Canning, O'Connell, take from it, is unknown and incomprehensible to them."

Mr Laing finds the inns at Stockholm bad, owing to the sufficiency of two club-houses to accommodate almost all the native visitors of the city. He finds the practice of a side-table whet before meals universal—reminding him of the old saying in his own country, that the people of Dunbar used to eat a solan goose to give them an appetite for dinner. He admires the royal palace, as all travellers do, and says a comparison of Hamlet to Tom Thumb would be as absurd as to compare this simply grand building with the Grecian toy-work of most public buildings with us. The population of Stockholm is declining—it is now 77,500—and the yearly deaths exceed the births by nearly nine hundred. Besides the few public buildings and mansions of the nobility, and excepting that the upper and middle ranks dress well under the influence of the taste diffused by a court, it contains no marks of opulence. Mr Laing calculates that there must be above 46,000 persons, or considerably more than a half of the population, who have no regular or describable means of subsistence. The fact of seven months of the year being unfit for labouring operations, produces much misery, and consequently much mortality, among the humbler orders. In short, we conceive from Mr Laing's descriptions that the population of Stockholm must be not unlike that of Dublin, a considerable body of persons living in comfort and elegance in the midst of a vast horde of squalid and starving poor.

The restrictions imposed on the exercise of industry in Sweden, here attract Mr Laing's attention. While we, he remarks, acknowledge *land* and *goods* as the sole kinds of property, there is abroad a third species, as fully established and protected by law as the other two, namely, the *exercise of industry*. "It is not merely the table, the spade, the loaf of bread, or the money acquired in making and dealing in these articles, that is property secured by law to the individual whose industry has produced them; but the exercise of this industry, as a carpenter, smith, baker, or merchant, is also property vested in particular individuals or classes of the community. * * This subject is curious. Suppose a hundred emigrants landed upon an island in the mouth of the Swan River, and that five or six betook themselves to the making of clothes and hats for the rest, would it be very absurd in principle if the five or six were to say to the others, 'We have all landed in this little world of ours, equal in our natural rights—no man has a better right than another to appropriate to himself any part of the land or its produce, and if we give up to you our natural right to the land by which you live, it is but just that you should give up to us your natural right to the exercise of the kinds of industry by which we live, the crafts of the blacksmith and tailor, each kind of property being of course subject to such conditions, regulations, or limitations, as our government may find necessary for the general good of the community.' It seems difficult to deny that labour may be property upon the same principle that land is property—the expediency of such appropriation for the general good of society. This expediency is admitted in the practice of all European countries except Great Britain." In Sweden, where the principle is carried to its extreme, "every trade or branch of industry that can be thought of, excepting perhaps common labour in husbandry, is exercised by privilege; and as the tradesman pays a tax to government for his privilege, or right to exercise his trade, he is entitled to protection from law—like any other proprietor—against whatever would diminish its value and injure his means of living and paying his tax; that is, against free competition. To be entitled to set up as a master, a man must 'serve an apprenticeship of five, seven, and, in some vocations, ten years; and by the laws of the incorporation, each master can only take a certain number of apprentices. He must then serve as a journeyman for a certain number of years, generally for four or six. He must then travel as a journeyman for at least two, in some trades for four or more years, for his improvement," supported, if he can get no work, by the funds of the incorporation at each place he stops at. Finally, he must produce a proper essay piece, to establish his claim to be admitted as a master in his craft. Young mercantile men have to go through similar periods of probation, and, after all, must wait for vacancies before they can get a privilege, like victuallers amongst us waiting for a licence from the justices. The results of the system are—on

* One volume 8vo. pp. 433. Longman and Company, London, 1839.

the one hand, an elevation of the working man by a sense of property, his having leisure to cultivate refined tastes, and an effectual check to the progress of population beyond the limits within which there is comfort for the whole class; on the other hand, a demoralisation from the wandering system, a dependence upon privilege rather than upon expertness or good conduct, and a waste of labour, and consequently of wealth, from the variety of hands into which very simple duties are divided. Hence all the ordinary arts are in a low state in Sweden, and generally all over the continent. Mr Laing remarks, that Britain, in pursuing an opposite system since the abolition of monopolies in 1624, is only trying an experiment. By unlimited freedom to exercise industry, the industrious class is immensely multiplied. A discrepancy arises in two great branches of our social polity, the means of producing food being under restriction, while the increase of mouths is not directly under any. Supposing the supply of food equally unlimited, Mr Laing argues that, with such powers of fire and water, and such industrious inclinations, Britain would become the seat of an enormous population beyond what its land could naturally support. About this, we believe, there is no doubt as to the fact; but the expediency, we need scarcely say, is a subject of great altercation.

With respect to the restrictions upon the exercise of skilled industry, here described by our tourist, we would remark, and it is surprising that Mr Laing has not made the remark himself, that the remaining class of unskilled labourers, constituting the largest portion of every community, must be just so much the worse off. It is simply one more evil in their condition; and from this cause, probably, arises no small portion of that immorality which Mr Laing has to remark as existing in Sweden.

In that country, it appears, the proportion of crime to population exceeds that of all other European countries. While, in England and Wales, one of every 707 is accused, and one of every 1005 convicted, of criminal offences, per annum; while in Ireland, one of every 455 is accused, and one of every 723 convicted, in the same space of time (on an average of the five years from 1830 to 1834); the amount of crime in Sweden reaches the appalling amount of 26,275 accused, and 21,262 convicted, in the year 1835, out of a population of 2,983,144, being an accusation for every 114, and a conviction for every 140! At the same time, while the illegitimate births bear, to the legitimate, in England and Wales the proportion of 1 to 19, in London and Middlesex that of 1 to 38, and in Paris itself that of 1 to 5, and in France at large 1 to 74, in Stockholm it is 1 to 23-10ths—that is, three of every seven persons are illegitimate. There is no where, perhaps never was any where, “a state of female morals approaching to this.” “Suppose,” says Mr Laing, “a traveller standing in the streets of Edinburgh, and able to say from undeniable public returns, ‘One out of every three persons passing us is, on an average, the offspring of illicit intercourse, and one out of every forty-nine has been convicted within these twelve months of some criminal offence!’ The main cause of this unprecedentedly low morality, Mr Laing conceives to be ‘a radical defect in the construction of society in this country. The weight of public opinion upon the side of morality, and acting as a check upon private conduct, is lost in Sweden by the too great proportion and preponderance in the social body of privileged classes—of persons whose living, well-being, distinction, social influence, or other objects of human desire, are attained by other means than public estimation gained by moral worth. The privileged classes in this country are not merely the hereditary aristocracy, the military, and members of the learned professions, but the tailor, the shoemaker, the smith, the joiner, the merchant, the shopkeeper; in short, every man exercising any craft, trade, branch of industry or means of living—that is to say, the whole of the upper and middle classes, down to the mere labourer in husbandry.’ These depend, not on industry, ability, or moral worth, but upon corporate rights, and licence obtained from government. The upper classes, in like manner, depend on birth, rank, and court favour. ‘Like soldiers in a regiment, a great proportion of the people under this social system derive their estimation among others, and consequently their own self-esteem, not from their moral worth, but from their professional standing and importance. This evil is inherent in all privileged classes, but is concealed or compensated in the higher, the nobility, military, and clergy, by the sense of honour, of religion, and by education. In the middle and lower walks of life, these influences are weaker, while the temptations to immorality are stronger.’ We find, Mr Laing remarks, the directly opposite state of things in America, where the influence of public opinion is so searching and vigorous in its operation, that individuals appear to be almost its slaves. Our author also regards, as a cause of the low morality of the Swedes, the custom of giving external rewards and honours—ribbons, crosses, and titles—for almost every kind of presumed merit, in the lower as well as higher classes, where a man’s true reward is his own approbation, and the estimation of the society in which he moves. The influence of a dissolute court and profligate government are other causes reckoned up by Mr Laing. It may be asked, what is the state of religion and of education in a country of such immorality? There is in Sweden, as is well known, a Lutheran church-establishment; it is free from schism, admirably organised,

and well supported. Positively all are educated, as far as reading and writing go; for there is an obligation by law on every adult person to be able to read the Scriptures, and give proof of Christian knowledge, before exercising any act of majority. There is also a perfect good feeling between the people and their clergy. But then, says Mr Laing, under that system by which every thing is matter of privilege, and law interferes to order every thing which men should be inclined to do for themselves, “under this pressure upon industry, property, free opinion, and free will, education is but a source of amusement, or of speculation in science, and religion a superstitious observance of church days, forms, and ordinances, with a blind veneration for the clergy.” Here, we think, the case may be safely left.

We have not room—at present at least—for any further account of Mr Laing’s volume; but, lest we should not be able to take it up in another paper, we meanwhile heartily recommend it to public attention, as the production of a man of agreeable literary talents, and far more than the average of reflecting power and information.

THE LEG.

[A translation from the German—From the New York Mirror.]

In the autumn of 1782, the surgeon, Louis Thevenet, of Calais, received an anonymous letter, requiring his attendance on the following day at a certain house not far from the town, and requesting him to bring with him the necessary instruments for amputating a limb. Thevenet was at that period renowned far and wide for his skill, and it was by no means uncommon for patients to send for him from England, in order to be guided by his judgment in cases of more than ordinary importance. He had been long attached to the army, and, though of somewhat uncouth manner, was universally beloved on account of the kindness of his disposition.

Thevenet puzzled a long time over the anonymous communication. Both time and place were indicated with the greatest exactness; at such an hour, and at such a spot, would he be expected; but, as before observed, the letter bore no signature. “A hoax, in all probability,” was the conclusion he arrived at, and he resolved not to go.

Three days afterwards he received a similar invitation, though couched in more pressing terms, with the announcement that a carriage would be at his door at nine the next morning, to convey him to the appointed spot.

Scarcely had the clock finished striking the hour of nine, on the following morning, than a handsome open carriage drove to the surgeon’s door; he made no further hesitation, but entered it. As he got in, he inquired of the coachman whither he was going to drive him, and the man replied in the English language, “I do not meddle with things that are no business of mine.”

“Oh ho! so I have to do with an Englishman, you surly dog,” replied Thevenet.

The coach arrived at length at the appointed house. “Whom am I to see—who lives here—who is ill?” asked Thevenet of the coachman, as he left the carriage. The man repeated his former answer, and was thanked for his civility in terms very much resembling those above quoted.

He was received at the door by a handsome young man, about twenty-eight years old, who conducted him up a staircase to a large room. His accent betrayed him to be a native of Great Britain. Thevenet addressed him in English, and was replied to with much politeness.

“You desired my attendance,” said the surgeon. “I am very grateful for the trouble you have taken to visit me. Pray, rest yourself; here are refreshments of all kinds, if you wish any thing before performing the operation.”

“First of all, sir, let me see and examine the patient; possibly it may not be necessary to proceed to amputation.”

“It will be necessary, Monsieur Thevenet. Let me entreat you to be seated. I have the fullest confidence in you—listen to me. Here is a purse containing a hundred guineas; they are yours when the operation is over, let the result be what it may. If, on the contrary, you refuse to fulfil my wishes—you see this loaded pistol—you are in my power, and, as sure as you are alive, I shoot you dead on the spot.”

“Sir, your pistol does not in the least alarm me. What is it you require? Tell me at once, without further preface, for what purpose have I been summoned here?”

“You must cut off my right leg.”

“With all my heart, sir, and your head as well, if you please: but if I am not mistaken, your leg appears perfectly sound. You sprang up the staircase just now with all the agility of a rope-dancer. What is the matter with your leg?”

“Nothing whatsoever, only off it must come.”

“Sir, you are a fool!”

“That, Monsieur Thevenet, is no business of yours.”

“Sir, you are a stranger to me, and I should like to have proofs of your being of sound mind.”

“Monsieur Thevenet, will you grant my request?”

“First, sir, give me some sufficient reason for inflicting so wanton a mutilation on you.”

“I cannot disclose the truth to you at present; all shall be communicated in due time. Allow me to ask you if you consider me a man of honour?”

“A man of honour does not present a pistol at his surgeon’s head. I have duties to perform even towards you, who are a total stranger to me. Without it be strictly necessary, I will not consent to mutilate you. If you are bent on becoming the assassin of an innocent father of a family—fire!”

“Tis well, Monsieur Thevenet,” answered the Englishman, taking up the pistol: “I will not be your murderer, but I will still compel you to remove my leg. What my entreaties have failed to obtain, what neither the hope of

reward nor the fear of death has succeeded in extorting from you, I will owe to your passion. I will lodge a ball in my leg, here before your very eyes.”

The young man sat down, and deliberately placed the muzzle immediately above his knee. Monsieur Thevenet rushed towards him in hopes of preventing him from effecting his mad design. “Stir from your seat!” exclaimed the Englishman, “and I pull the trigger. Answer me once more: will you put me to the needless pain—will you, by your refusal, compel me to increase the sufferings I have to endure?”

“Sir, once more you are a fool. But be it as you wish—I consent to take it off.”

The necessary preparations were soon made. The leg was removed; and in a tolerably short space of time the patient was restored to health. He gave his surgeon a munificent fee, and felt his esteem for him increase each day. With tears of gratitude in his eyes he thanked him for relieving him of his limb, and sailed for England duly equipped with a wooden leg.

About eighteen months after these events, Monsieur Thevenet received a letter from England, to the following effect:—

“Enclosed is an order on Monsieur Panchaud of Paris for two hundred and fifty guineas, which I beg you to accept in token of my heartfelt gratitude. By depriving me of a limb, which formed the sole obstacle to my earthly bliss, you have rendered me the happiest of mortals! Best of men! at length shall you be made acquainted with the real grounds of what you were pleased to term my mad whim.

Shortly after my last return from the East Indies, I became acquainted with perfection, in the person of Emily Harley; I fell desperately in love with her. Her wealth and family connections made my relations as eager for the match as myself, though I saw but her beauty and angelic disposition. I yoked myself to the car of her admirers. Alas! my dear Thevenet, I was fortunate enough to become the most unfortunate of all my rivals; she loved me—and me only; she avowed her affection, and—rejected me! In vain did I press my suit, in vain did her parents and friends intercede for me—she remained inexorable.

For a long time did I fail to discover the cause of her refusal to become mine: to make one happy whom she owned to loving to distraction. At length one of her sisters revealed the mystery. Miss Harley was a marvel of beauty, but, strange to relate, was born with but one leg, and this blemish rendered her averse to becoming my wife, as she feared I might look on her with aversion.

My resolution was soon formed. I determined there should be no disparity between us, and, thanks to you, worthy Thevenet, it exists no longer.

I returned to London with my wooden leg, and at once betook myself to Miss Harley. The report had circulated (set on foot by a letter I had previously dispatched to England) that I had injured my leg by a fall from my horse, and that amputation was found necessary; I became the object of universal pity. Emily fainted away at our first meeting. She remained for a long time inconsolable, but at length consented to our marriage. On the day after our union did I, for the first time, disclose to her the sacrifice I had made to gain her hand. Her love for me became even yet more tender. Oh, Thevenet! to obtain my Emily, I would lose ten more legs, without the least compunction.

My gratitude towards you can only end with my life. Come to London and pay us a visit; and when once you have seen my angel-wife, I defy you to say again that I am a fool!

CHARLES TEMPLE.

Monsieur Thevenet showed the letter to his friends, after having related all the preceding circumstances, and he never told the story without a burst of laughter, as he wound it up with, “He is as much a fool as ever!”

The following was his answer to the above:—

“Sir—I am obliged to you for your munificent present, for such must I term a sum so much exceeding the value of my humble services.

I congratulate you on your marriage with your accomplished countrywoman. True, a leg is a heavy price to pay for the possession of a fair and virtuous wife; yet not too heavy, if the result prove in favour of the change. It cost Adam a rib from his body to be blessed with Eve; many other men, since him, have lost their ribs for their fair ones; some even have forfeited their heads.

Notwithstanding your protestations, you must allow me to retain my original opinion. Very probably you are right at present, for you are still in all the rapture of the honeymoon. I am right, too, but with this difference, that it requires time to be convinced of the justice of my opinion; for it is ever long ere we are willing to admit the truth of ideas that clash with our own.

Have a care, sir, for I strongly suspect that ere two years are flown, you will begin to wish that the amputation had been performed *below* the knee-joint. In three years it will strike you that you might very well have compounded for the loss of the foot only. In four years you will think that the sacrifice of your great toe might have very well sufficed, and before the expiration of the fifth year, you will grudge even your little toe. After six years, I am afraid the paring of your nails will seem to you all that was necessary.

I have said all this without prejudice to your wife’s merits. Beauty and virtue are not so fleeting as the judgment of man. In my youth I would have hid down my life for the beloved one, but I never would have lost my leg for her; the loss of the one I would never have repented, but each day I should have repined over the sacrifice of the other. Had I ever consented to such sacrifice, I should say, ‘Thevenet, you were a fool!’ and herewith I have the honour, &c.

L. THEVENET.

In the year 1793, during the reign of terror, Monsieur Thevenet, who had been denounced as an aristocrat by some aspiring member of his profession, fled to London in order to escape the equalising propensities of the guillotine. When there, desiring to increase his acquaintance, he inquired for the residence of Sir Charles Temple.

He was directed to his mansion, and was announced to

his master. Seated in an easy chair by the fireside, a foaming tankard of porter at his elbow, and twenty newspapers strewed about him, appeared a portly gentleman, whose size would scarcely allow him to quit his chair.

"Ha! right welcome, Monsieur Thevenet!" exclaimed the portly gentleman, who was no other than Sir Charles Temple; "do not be offended with me if I resume my seat, but my cursed wooden leg is always in my way. In all probability, my worthy friend, you are come to ascertain if my hour of conviction has arrived?"

"I am here as a fugitive from my native land, and claim your protection!"

"You must take up your abode with me, for, of a verity, you are a wise man. By this time, Thevenet, I should have been admiral of the blue, if this infernal wooden leg had not incapacitated me for serving my country. Here am I reading in the papers news of the most stirring kind, and cursing my stars that I can take no part in all that is going on. Come, say something consoling to me."

"Your excellent lady is far better adapted than I to play the comforter."

"Don't mention her. Her wooden leg hinders her from dancing, so she has devoted herself to cards and scandal; there is no possible dealing with her; but she is a good enough woman in her way."

"Then, after all, I was right?"

"Most indubitably so, my dear Thevenet: but enough of that. I committed an egregious blunder. Had I but my leg back again, not a nail-pairing of it would I part with. Between ourselves, be it said, I was a fool; but keep this piece of truth to yourself."

A FEW WORDS ON ROADS AND RAILWAYS.

THE advantages held out by railways are so palpable, that the opposition which they meet with in some quarters is apt to excite surprise. But if we look but a short way into the history of improvements, we find there is really nothing to be wondered at. Every improvement in the means of internal communication has in its turn been met by similar opposition. We have now, for example, tolerably good roads, but these have not been established without encountering a world of petty annoyance. About a century ago, some of the counties in the neighbourhood of London petitioned Parliament against the extension of turnpike roads into the remoter counties. Those remoter counties, it was pretended, from the cheapness of labour, would be able to sell their grass and corn at a lower rate in the London market than themselves, and would thereby reduce their rents and ruin their cultivation.* In spite of these representations, turnpike roads were extended into the remoter counties; and what has been the result?—the rents of land, and the prices of all kinds of rural produce, have risen instead of fallen in the neighbourhood of the metropolis. Every one has heard of the condition of the roads generally in all parts of Scotland till within the last forty or fifty years. They went in straight lines up one side of a hill and down another, crossed bogs which were impassable during winter, and were so badly laid that days were consumed in a journey which can now be effected in a few hours. An aged gentleman, writing his recollections of these times, drolly observes, "that the common carrier from Selkirk to Edinburgh, thirty-eight miles distant, required two weeks to make out his journey betwixt the two towns, going and returning, with a suitable resting time at each to his poor fatigued horse, which had perhaps not less than five or six hundredweight of goods to drag along. The road, originally, was among the most perilous in the whole country: a considerable extent of it lay in the bottom of that district called Galla water, from the name of the principal stream. The channel of the water itself, when not flooded, was the track chosen, as being the most level, and easiest to be travelled on. The rest of the way, very much up-and-down-hill, was far worse. The townsmen of this adventurous individual, on the morning of his way-going, turned out to take their leave of him, and to wish him a safe return from his perilous undertaking."†

There is, we believe, not a road in the kingdom of which similar tales could not be told, and it is therefore the more surprising that there should have been any opposition to the improved kind of highways. There was opposition, however. The establishment of turnpike roads, such as are now common, was as much opposed by the bulk of the landed gentry and farmers in Scotland, as was the extension of highways by the rural population around London. Unless for the strenuous exertion of a minority of intelligent and liberal minded men, the improved roads would not have been made. "Every one (continues the authority just quoted), at the first laying out of any road in a new direction, was anxious to have it turned as far about as possible from himself. Even the tenantry had no desire to have a public road led close in upon their own premises, but wished them to be turned aside from their farm-houses. The decided utility, however, of these improved means of communication, came latterly

to make them be more correctly appreciated, and the contest at last was, who should have the great roads led nearest to their own respective properties."

Acting according to the glimmering light of practical knowledge which existed in these times—that is, only about half a century ago—the people were as greatly opposed to certain proposed improvements in the form of bridges as to new lines of road. It was universally believed that the stones of an arch would not retain their hold if the curve were made elliptical, or only the segment of a circle. There could, indeed, be no doubt of this, for bridges had been built in the form of half circles from the beginning of the world upwards. At length, doubts began to be entertained on this point. Architects began to erect bridges with only a slight rise in the middle, and great was the astonishment at the result of the enterprise. It was only after such bridges had stood a number of years that doubts of their durability were abandoned.

Canals came in for the usual share of opposition, and now railways take their turn. It is a grievous mistake to blame the individuals who oppose improvements of this nature. They but act according to the degree of intelligence which they possess. Had they lived sixty years since, they would have objected to improved turnpike roads; forty years since, to elliptical bridges; and, thirty years since, to canals. The present opposition is but the last in the series. In forty years hence, there may be something discovered still better than railways; and if so, we cannot entertain a doubt of their encountering the same species of opposition.

The design of railways, as we all know, is to improve the means of communication in inland districts of the country. At present, notwithstanding the many excellent roads, and also some canals, there is a deficiency in this respect. Railways, however, will only act a part in the economy of communication. They will not supersede roads or canals. It is extremely probable that in time railways will augment the traffic on roads—we mean cross and subsidiary roads—and likewise on canals. Each of the three means of conveyance will be found suitable to a particular order of traffic or thoroughfare, and will accordingly exist and flourish in connection with the others. It is treating the subject very loosely to suppose that railways will furnish only the means of readily travelling betwixt remote distances. Besides this, they will serve to develop resources and excite a traffic, of which in the present infancy of their establishment, we can form no adequate idea. It may be safely averred that there is no part of the united kingdom which does not possess some latent capabilities that may be advantageously explored and brought into action. One boasts of its romantic beauty, another its climate, a third its abundance of the purest water, a fourth its mines, a fifth its population, a sixth its rural produce, and so on without end, each containing something of which the others are less or more deficient, and which it would be highly desirable to bring into use for the general good. Taking this extended view, what an immense stock of exchangeable and inexchangeable wealth does our country contain, which is at present all but useless for lack of a ready means of communication! It is distressing to think, that, from the want of some ready means of access, there are certain inland districts of our own land less available for purposes of commerce than places situated on the sea-shores of distant continents; for, according to the existing modes of transport, goods may be sent a thousand miles by sea at a much less expense than they could be carried by a waggon twenty miles on land. Railways, although not reaching every corner of the country, will greatly remedy this evil. They will excite the energies of wide-spread districts through which they pass, and in some respects give to inland towns that degree of accessibility, and consequently opulence, which has till the present day belonged only to towns on the coast. The increase which will take place in the national resources, when the system of railways shall be completed, it is impossible to calculate.

Another very observable benefit from railways will consist of the breaking down of local prejudices. At present, certain towns maintain unworthy jealousies of each other. By residing constantly in one spot, our minds become narrowed: we learn to look upon our own gin-horse tract as all the world; and foolishly imagine that the usages and habits of thinking peculiar to our fellow mortals must necessarily be wrong, and therefore liable to reproach and sarcasm. Railways, by bringing towns into more close neighbourhood with each other, and introducing their respective inhabitants to a mutual acquaintanceship, will tend greatly to soften these jealousies and local prejudices. Where even no such feelings have ever existed, the most beneficial intercourse cannot fail to be established betwixt different seats of population. Let us take the case, for instance, of Newcastle and Edinburgh. Excepting for some slight commercial connections and casual friendships, the inhabitants of these cities know nothing of each other, yet it would be vastly for the benefit of both that they should be reciprocally acquainted; but without a railway it is clear that no such intimacy can take place. In this manner, whether we view railways as a means of improving the mercantile resources or the moral qualities of the people, they cannot fail to be productive of an incalculable degree of good to the whole mass of society.

THE RATTLESNAKE.

A WRITER in the Philosophical Journal presented, a few years ago, the following anecdotes of this remarkable creature:—

"Rattlesnakes have the power of laying down their fangs along their jaw-bones when at rest, and of raising them at will, as sharks also do, and some other fishes. It is only when inflicting a defensive wound that their fangs are used. At this time the snake, either coiled or in any other position, has the power of darting about two-thirds of its body towards its object; and with its mouth open to its utmost stretch, all its fangs being erect, it strikes so violent a blow whilst it bites, that I have been assured by some Osage chiefs, that on such occasions they felt, when struck, as if about to be thrown off their centre of gravity. The fangs make their way into flesh, or, indeed, into tough leather, with perfect ease, and instantaneously. The wound is generally mortal, if proper remedies be not at once resorted to. Among the native Americans, cutting out the wounded part, and searing, or, as it is termed in the country, scaring it with fire, is considered the most effectual; but even this requires great promptitude to afford a chance of safety. The quantity of venom infused is more or less, as the animal may have been more or less irritated. If made to bite themselves, their own flesh affords no antidote, for they die in excruciating torments. The venom of a rattlesnake, while the animal is striking an object, will be sometimes ejected to a considerable distance. I have seen one confined in a wire cage, when much enraged, strike against the bars so furiously that the poison was sent several feet towards me.

To give you an idea of the long time this poison retains its property, I shall relate a curious but well-authenticated series of facts, which took place in a central district of the state of Pennsylvania, about twenty years ago. A farmer was so slightly bit through the boot by a rattlesnake, as he was walking to view his ripening corn-fields, that the pain felt was thought by him to have been from the scratch of a thorn, not having seen or heard the reptile. Upon his return home, he felt, on a sudden, violently sick at the stomach, vomited with great pain, and died in a few hours. Twelve months after this, the eldest son, who had taken his father's boots, put them on, and went to church at some distance. On his going to bed that night, whilst drawing off his boots, he felt slightly scratched on the leg, but merely mentioned it to his wife, and rubbed the place with his hand. In a few hours, however, he was awakened by violent pains, complained of general giddiness, fainted frequently, and expired before any succour could be applied with success; the cause of his illness also being quite a mystery. In the course of time his effects were sold, and a second brother, through filial affection, purchased the boots, and, if I remember rightly, put them on about two years after. As he drew them off, he felt a scratch, and complained of it, when the widowed sister being present, recollected that the same pain had been felt by her husband on the like occasion. The youth went to bed, suffered and died in the same way that his father and brother had done before him. These repeated and singular deaths being rumoured in the country, a medical gentleman called upon the friends of the deceased to inquire into the particulars, and at once pronounced their deaths to have been occasioned by venom. The boots that had been the cause of complaint were brought to him, when he cut one of them open with care, and discovered the extreme point of the fang of a rattlesnake issuing from the leather, and assured the people that this had done all the mischief. To prove this satisfactorily, he scratched with it the nose of a dog, and the dog died in a few hours from the poisonous effect it was still able to convey. In confirmation of these facts, I have been told by native Americans that arrows dipped in rattlesnake venom would carry death for ages after.

Perhaps one of the most wonderful faculties possessed by this and many other species of snakes, is that of being able to live, without any food whatever, for years; and it is quite as remarkable, that during the lapse of this astonishing fast, their appearance and condition scarcely exhibit their being in any want. Their movements, the power of rattling, and that of inflicting mortal wounds, are perfectly kept up. One which I confined in a cage for three years, had frequently rats, young rabbits, and birds of various kinds put in, sometimes alive, and at other times dead, without their ever being touched, not even a movement would be made by the snake to approach them; while, on the contrary, the live quadrupeds and birds showed great symptoms of fear, and threw themselves violently in all directions about the cage to effect their escape from an enemy well known to them. The operation of throwing off its skin annually was, however, abandoned, after the first spring of confinement; and as the animal was small, and I did not consider it as arrived at its middle age, I measured its length with accuracy, and discovered that during the whole time of its imprisonment it did not grow in the least. To what extent this power of abstinence is ever used when the animal is at liberty, I am unable to tell; but I have thought that the animal's possessing it so eminently went a great way towards proving that it had not that of fascination, as it would be very unnatural for an animal so gifted to lie and suffer, while the single glance of a magnetic eye could bring down a bird at once from the top of any tree into its mouth."

The latter observation is evidently liable to a fallacy, as the animal may have the power of taking prey, without using that power. On the subject of its fascination, there is a curious paper in a late work by a respectable American writer, entitled "Peter Pilgrim." It is there treated as an unquestionable property of the rattlesnake, however unlike any other property possessed by animals. The paper contains the following almost incredible statement, as to the reality of this power, by a Mr Willard, and which we learn is extracted from a work by Dr Samuel Williams, of the state of Vermont:—

"When I was a boy about thirteen years old, my father sent me into a field to mow some briars. I had not been

* Dr Adam Smith.

† Robertson's Rural Recollections.

long employed when I discovered a large rattlesnake, and looked round for something to kill him; but not readily discovering a weapon, my curiosity led me to view him. He lay coiled up, with his tail erect, and making the usual singing noise with his rattles. I had viewed him but a short time, when the most vivid and lively colours that imagination can paint, and far beyond the powers of the pencil to imitate, among which yellow was the most predominant, and the whole drawn into a bewitching variety of gay and pleasing forms, were presented to my eyes; at the same time my ears were enchanted with the most rapturous strains of music, wild, lively, complicated, and harmonious, in the highest degree melodious, captivating, and enchanting, far beyond any thing I ever heard before or since, and indeed far exceeding what my imagination in any other situation could have conceived. I felt myself irresistibly drawn towards the hated reptile; and as I had been often used to seeing and killing rattlesnakes, and my senses were so absorbed by the gay vision and rapturous music, I was not for some time apprehensive of much danger; but suddenly recollecting what I had heard the Indians relate (but what I had never before believed) of the fascinating power of these serpents, I turned with horror from the dangerous scene; but it was not without the most violent efforts that I was able to extricate myself. All the exertions I could make with my whole strength were hardly sufficient to carry me from the scene of horrid yet pleasing enchantment; and while I forcibly dragged off my body, my head seemed to be irresistibly drawn to the enchanter by an invisible power. And I fully believe that in a few moments longer it would have been wholly out of my power to make an exertion sufficient to get away."

PLAN FOR IMPROVING THE GIPSIES.

THE operations which have for some time been in progress in England for the improvement of the gipsy population, having lately attracted the attention of a few individuals in Edinburgh, a society has been formed for effecting a similar object in Scotland. All the harsh and oppressive measures which have hitherto been attempted for extirpating the gipsies, or for expelling them from the country, having signally failed, it is now proposed to try how far kindness will induce them to change their habits, and assume the character and condition of respectable members of society. The number of gipsies in Great Britain is believed to be from 18,000 to 20,000, and of these 1000 or upwards are to be found in Scotland. The Scottish gipsies are chiefly located—that is, when not wandering abroad—in Roxburghshire on the borders of England, particularly at the villages of Kirk-Yetholm, Kelso, Jedburgh, &c. The Kirk-Yetholm colony, which amounts to 26 families, or 125 individuals in all, is one of the oldest and most distinct; and here, therefore, it has been determined that the first experiment for improvement shall be made.

The condition of this small remnant of an ancient and interesting race, is that of extreme poverty. The professions which the able-bodied gipsies pursue, are of a humble vagrant character, such as selling crockery, collecting rags, and making baskets; and they consequently possess no means for improving their physical, let alone their moral, condition. Their principal wealth consists of one or more horses or asses, with which they carry about in carts or panniers the wares in which they deal. During the winter months, the members of the clan are confined to their proper home, but as soon as the fine weather of spring sets in, they proceed on their travels through the surrounding rural districts, encamping by the road-sides and in bye-lanes, in a manner perfectly romantic and independent, but with much hardship to themselves, and any thing but benefit to the community. There was a time when this vagrant mode of living had its charms. The country was not inclosed as it now is; the pedlar, spoonmaker, and tinker, were acceptable guests in the kitchens, or at least in the barns, of the farmers; and there prevailed a laxity of police, which was extremely agreeable to all orders of gipsies and mendicants. The state of things is now so very different, that many of the gipsies have expressed their willingness to remain at home, if work were given to them. It is, partially, upon the significance of this willingness to settle, that the hopes of the society for their improvement are founded; for so long as they continue their present wandering life, their character and habits will assuredly remain unaltered.

Two things are proposed to be attempted. Those parents who are willing or can be induced to remain at home, and betake themselves to some regular employment, are to receive every encouragement to do so. In addition to the offer of work of some kind, means will, perhaps, be found to make a present of bibles, books, tracts, tools, clothing, or articles of furniture, to those who, upon trial, have shown their willingness to maintain themselves by their industry at home, instead of wandering abroad. The great thing to be attempted, and which promises better results, is that part of the plan which respects the children. It is proposed, with consent of the parents, to keep the children at home through the whole year, not to separate them from their parents when the latter are at home, but when they take their departure, to have the children left behind, to board them in the village, and to educate them. By these means the juvenile population will acquire habits of local attachment, and moral and religious sentiments, which will indispose them from adopting the vagrant life of their forefathers. It is calculated that the expense of board per week for each child would be from 2s. to 2s. 6d., and that for each, the annual school wages would amount to about 10s. The total expenses of the plan of improvement, including both adults and children, are expected to be at the utmost only £120 per annum, and we should think, that in the present age of benevolence so small a sum will be raised with very little difficulty.

There are, it appears from the small pamphlet from which we glean these particulars,* well-founded expecta-

tions that the operations of the society will be successful. All the parents who have been spoken to on the subject express a most anxious desire to have their children instructed, and afterwards hired as servants, or apprenticed to trades, so that they may lead a comfortable and respectable mode of life. There is, therefore, no fear of the results, provided the necessary funds be raised to carry the benevolent intentions of the society into execution, namely, the rescuing an interesting portion of our countrymen from ignorance, misery, and vice.

THE WILD FLOWER.

BY J. F. SMITH.

Sweet wildling tufts that, 'mid the waste,
Your lowly buds expand;
Though by no sheltering walls embraced,
Nor trained by beauty's hand:
The primal flowers which grace your stems
Bright as the dahlia's shine,
Found thus, like unexpected gems,
To lonely hearts like mine.
Tis a quaint thought, and yet, perchance,
Sweet blossoms, ye are sprung
From flowers that over Eden once
Their pristine fragrance flung;—
That drank the dews of Paradise,
Beneath the starlight clear;
Or caught from Eve's deflected eyes
Her first repentant tear.

JOHN FITCH.

THE following account of a new candidate for the honour of discovering steam navigation, is given in Hall's Notes on the Western States of America, lately published:—

"In 1785, John Fitch, a watchmaker in Philadelphia, conceived the design of propelling a boat by steam. He was both poor and illiterate, and many difficulties occurred to frustrate every attempt which he made to try the practicability of his invention. He applied to Congress for assistance, but was refused; and then offered his invention to the Spanish government, to be used in the navigation of the Mississippi, but without any better success. At length a company was formed, and funds subscribed, for the building of a steam-boat, and in the year 1788 his vessel was launched on the Delaware. Many crowded to see and ridicule the novel, and, as they supposed, the chimerical experiment. It seemed that the idea of wheels had not occurred to Mr Fitch; but instead of them, oars were used, which worked in frames. He was confident of success; and when the boat was ready for the trial, she started off in good style for Burlington. Those who had sneered began to stare, and they who had smiled in derision, looked grave. Away went the boat, and the happy inventor triumphed over the scepticism of an unbelieving public. The boat performed her trip to Burlington, a distance of twenty miles; but, unfortunately, burst her boiler in rounding the wharf at that place, and the next tide floated her back to the city. Fitch persevered, and with great difficulty procured another boiler. After some time, the boat performed another trip to Burlington and Trenton, and returned in the same day. She is said to have moved at the rate of eight miles an hour; but something was continually breaking, and the unhappy projector only conquered one difficulty to encounter another. Perhaps this was not owing to any defect in his plans, but to the low state of the arts at that time, and the difficulty of getting such complex machinery made with proper exactness. Fitch became embarrassed with debt, and was obliged to abandon the invention, after having satisfied himself of its practicability. This ingenious man, who was probably the first inventor of the steam-boat, wrote three volumes, which he deposited in manuscript, sealed up, in the Philadelphia Library, to be opened thirty years after his death. When, or why, he came to the west, we have not learned; but it is recorded of him that he died and was buried near the Ohio. His three volumes were opened about five years ago, and were found to contain his speculations on mechanics. He details his embarrassments and disappointments, with a feeling which shows how ardently he desired success, and which wins for him the sympathy of those who have heart enough to mourn over the blighted prospects of genius. He confidently predicts the future success of the plan, which, in his hands, failed only for the want of pecuniary means. He prophesies that in less than a century we shall see our western rivers swarming with steam-boats; and expresses a wish to be buried on the shores of the Ohio, where the song of the boatmen may enliven the stillness of his resting-place, and the music of the steam-engine soothe his spirit. What an idea! Yet how natural to the mind of an ardent projector, whose whole life had been devoted to one darling object, which it was not his destiny to accomplish! And how touching is the sentiment found in one of his journals: 'the day will come when some more powerful man will get fame and riches from my invention; but nobody will believe that poor John Fitch can do any thing worthy of attention.'"

CURIOSITIES OF THE COINAGE.

The word guinea—that goodly but now obsolete piece of gold—owes its origin to a circumstance which sheds almost unparalleled lustre upon the naval records of our country. In the year 1666, Sir H. Holmes, a highly distinguished admiral, having contributed to the total discomfiture of the Dutch, under De Ruyter, was sent with a strong division of the victorious fleet to the coast of Holland, where he had the good fortune to capture or destroy, in Schelling Roads, 160 sail of rich merchant ships, valued at £1,200,000, part of which being freighted with bullion and gold dust from Cape Coast Castle, an African settlement belonging to the enemy. This rich prize was soon after coined into 21s. pieces, and acquired the name of Guinea, with reference to the country from

which it was derived. About this time our copper currency was first struck with a figure of Britannia upon the obverse, in compliment to Miss Stuart, one of Charles II.'s most memorable beauties, and is said to have originally borne a striking resemblance to that lady, from whose person it was expressly modelled.—*Newspaper paragraph.*

FRESH AIR.

The celebrated Dr Darwin was so impressed with a conviction of the necessity of good air, that, being very popular in the town of Derby, once on a market-day he mounted a tub, and then addressed the listening crowd. "Ye men of Derby, fellow-citizens, attend to me! I know you to be ingenious and industrious mechanics. By your exertions you procure for yourselves and families the necessaries of life; but if you lose your health, that power of being of use to them must cease. This truth all of you know; but I fear some of you do not understand how health is to be maintained in vigour—this then depends upon your breathing an uncontaminated air; for the purity of the air becomes destroyed where many are collected together; the effluvia from the body corrupts it. Keep open, then, the windows of your workshops, and as soon as you rise, open all the windows of your bedrooms. Inattention to this advice, be assured, will bring diseases on yourselves, and engender among you typhus fever, which is only another name for putrid fever, which will carry off your wives and children. Let me again repeat my serious advice—open your windows to let in the fresh air, at least once in the day. Remember what I say; I speak now without a fee, and can have no other interest but your good in this my advice."—*Maidstone Journal.*

EMBARKATION OF TWO ELEPHANTS AT BOMBAY.

By overland accounts lately received from India, two elephants, which the government of India intend to present to the pacha of Egypt, were embarked at Bombay in the Columbo, on the 22d of December last. At ten o'clock in the morning, these noble animals, male and female, were walked out of the Commissariat Compound, where they had been for some time kept, to the jetty opposite, alongside of which the Columbo had been hauled up to receive them. The male elephant is of an extraordinary size, considerably above ten feet high, with very long tusks, good tempered, and cunning wital, for he could not be induced, by any persuasions, to trust his foot on the jetty. The female is not much above nine feet in height, very good tempered, and more tractable than her partner, for she made no hesitation to walk wherever she was commanded. Every preparation had been made on board the vessel to hoist the animals in from the pier, the hatches had been widened and tackled already, when the obstinacy of the male elephant obliged Captain Graham to adopt some other method of shipping his gigantic freight; he determined, therefore, to swim them alongside, and then lift them; for this purpose the vessel was hauled off clear of the jetty, and the male was then marched into the water with the slings on, ready for an immediate hoist; considerable time was occupied in getting him alongside, and, fastening the tackle to the slings, which being at length accomplished, he was hoisted away, and, with not half the trouble that was expected from his immense size and strength, fairly and snugly lodged in his berth, down in the main hold, where stalls had been fitted up for them, similar to those prepared for horses, only stronger and more secure. The female had, all the while, been looking on, and seemed not at all to relish the treatment her partner received, for she became obstreperous, and refused for some time to go into the water; she was, however, compelled to do so, and soon was in mid air, flinging and kicking about her with all her might.—*Correspondent of Athenaeum.*

AMUSEMENT VERSUS DRINKING.

A singing and dancing people is certainly higher in the scale of morality than a sotting people. The national ballad and the national dance open the way to every department of poetry and of music; when people have reached this point, it is easy to awaken the feeling for every kind and degree of art. The hundreds who resort to a museum cannot at the same time be sitting in an ale-house or a gin-shop. Nor is this all; they will soon come to feel the boundless disparity that exists between men whom art raises into demi-gods, and animals in human shape degraded by drunkenness below the level of brutes. It is an error to suppose that Christianity forbids the education of man by the forms, the influences, the conceptions of art: it forbids only those perversions and misapplications of art which the noble and the uncorrupted among the Greeks equally rejected.—*Rammer's England.*

PRECOCIOUS TALENTS.

The effects of study vary according to the age at which it is commenced: long-continued application kills the youthful energies. I have seen children full of spirit attacked by this literary mania beyond their years, and I have foreseen with grief the lot that awaited them; they commenced by being prodigies, and they ended by being stupid. The season of youth is consecrated to the exercise of the body, which strengthens it, and not to study, which debilitates and prevents its growth. Nature can never successfully carry on two rapid developments at the same time. When the growth of intellect is too prompt, its faculties are too early developed, and mental application is permitted proportioned to this development; the body receives no part of it, because the nerves cease to contribute to its energies; the victim becomes exhausted, and eventually dies of some insidious malady. The parents and guardians, who require and encourage this forced application, treat their pupils as gardeners do their plants, who, in trying to produce the first rarities of the season, sacrifice some plants to force others to put forth fruit and flowers which are always of a shorter duration, and are inferior in every respect to those which come to their maturity at a proper season.—*Tissot.*

PRICE THREE HALFPENCE.

WAGES.

THE circumstances which determine the rate of wages amongst hired operatives have been inquired into, with great anxiety for correct results, by three modern political economists, Ricardo, Malthus, and McCulloch; and it is generally allowed that the principles which operate on this great branch of our social economy have been nearly, if not fully, ascertained by these gentlemen. We propose, in the present place, to give a simplified view of their doctrines, the diffusion of which amongst the labouring-classes must have as yet been very imperfect, although there are few which bear more pressingly on their interests.

Upon the supposition of a system of things, in which men, as employers and employed, compete with each other, instead of co-operating in a great social system, as proposed by Mr Owen; upon the supposition of this system, we have necessarily to understand the existence of two things—labour and capital. Labour is what adapts the works and productions of nature to human needs; capital is an accumulation of the results of labour beyond what has been required for immediate use. Capital, therefore, consists of that part of the value of land which has been given to it by labour, of the stored produce of the land, of buildings, instruments, machinery, manufactured goods, clothes, and all other needful and useful things which possess what is called exchangeable value, and can be made directly available, either to the support of human existence, or to the facilitating of production. All these things are possessed by individuals as property: they belong either to the individuals who have made or produced them, or to the representatives of those individuals. And the great use of capital is its enabling men to set about other labours, seeing that it supports them while the fresh tasks are going forward. Few are without something which may be called capital; the working man who has a spade or hook of his own, or a week's free wages, may be said to possess capital. This class, however, have upon the whole a comparatively small amount of capital. Such amounts of this wealth as serve to employ labourers in certain tasks, are possessed by only a few, forming the class called masters or employers. Yet, in a country where labour is free, every one has his own chance, by saving, to become a capitalist and employer; and practically, in our country, we find that a great proportion of the master manufacturers were once working men, or are the sons of men who have been so.

Labour, being free, is a marketable article. The man, able and willing to work, comes forward for the purpose of finding employment, upon the rewards of which he may live. Certain special circumstances may affect his case, as the difficulty or nicety of the work he can perform, its agreeableness or disagreeableness; but these do not now call for attention. Our object is to explain the circumstances which affect the remuneration of labour in general. It has been laid down, then, that the rate of wages depends on the amount of that portion of capital appropriated to the payment of wages, compared with the number of labourers. This portion of capital consists of food, clothes, and other articles required for the use and consumption of labourers. The money put into the workman's hand is but something representing a certain quantity of those articles which falls to his share. It is not the quantity of money he receives, but the quantity of necessities and conveniences for which that money will exchange, that is to be considered as really forming his wages.

The rate of a working man's returns is thus liable to be affected by various contingencies. It may decline in consequence of the capital distributable in reward

of labour being diminished, while the labourers have remained equally numerous; or by the number of labourers increasing, while the capital has remained the same; or by the capital decreasing and the number of labourers increasing simultaneously. Or it may rise in consequence of all these circumstances reversed. On the other hand, if capital and labourers increase or decrease at the same rate, wages will not be changed. No change ever takes place through any other means than a disturbance of the proportion between the fund of food, clothing, &c., at the command of labourers, and the number of the labourers. Mr McCulloch illustrates the principle by supposing that this fund, in any given country, were reduced to the standard of wheat, and that it formed a store of 10,000,000 of quarters. If the labourers in that country were 2,000,000 in number, each would have five quarters, supposing all to be reduced to one level. The economist asks how it is possible that each could have more than five quarters, if the store were 100,000 quarters less, or the labourers 100,000 more. In these cases, the share of each, that is, his wages, would inevitably be less. "The well-being and comfort of the labouring classes are, therefore," says Mr McCulloch, "especially dependent on the relation which their increase bears to the increase of the capital that is to feed and employ them. If they increase faster than capital, their wages will be reduced; and if they increase slower, they will be augmented. In fact, there are no means whatever, by which the command of the labouring class over the necessities and conveniences of life can be enlarged, other than by accelerating the increase of capital as compared with population, or by retarding the increase of population as compared with capital; and every scheme for improving the condition of the labourer which is not based on this principle, or which has not an increase of the ratio of capital to population for its object, must be completely nugatory and ineffectual."

The doctrine is amply illustrated by circumstances in the condition of our own and surrounding countries. In America, an active and intelligent people cultivate a fine soil of practically unlimited extent to the best advantage: thus the capital destined for the support of labourers rapidly increases. Population also increases rapidly, doubling itself every twenty-five years, but not so rapidly as that department of capital; and hence wages are high, and the working man's command of necessities great. In Ireland the population has nearly quadrupled in about a century, while the fund for the support of labour has not increased in proportion; hence wages are at only fourpence, sixpence, and eightpence a day in Ireland, and employment is often not to be had for months. In England the inhabitants have only doubled in a century, while wealth has greatly increased, and the proportion of food to the labourers has probably experienced some improvement, considering all classes of them together. The nature of the soil, the domestic feelings of a people, and the possibility of spreading out, are circumstances of great importance. The soil of America is such as to provide very quickly and largely for its labourers; it is also of vast extent, and much remains unsettled. On the other hand, in Ireland the soil is limited, capital is scarce, and there is at the same time, from the habits of the people, a tendency to very rapid increase of numbers. It may chance that the most fecund nation is not placed on the less bounded field, or the best soil; or there may be circumstances in the condition of this nation, tending to prevent capital from increasing; in which case the evil of low wages may be considered as almost irremediable amongst that people. To be placed on such

a territory as America, with only a moderate tendency to increase in numbers, may be considered as good fortune in a nation. We need scarcely remark, that an unlimited power to manufacture, and to exchange the manufactures beyond the bounds of the state, for food raised there, is exactly equivalent, in its effects, to an unlimited soil within the state.

The check which is given to population in any country, when the capital proves insufficient to support the people in the way they have been accustomed to, gives rise to a subordinate doctrine as to what is called the *natural or necessary rate of wages*. The rewards of labour, it is assumed, must be such as to allow of the supply of labourers being kept up, and of their being maintained in a proper manner. Every people has different notions of what is necessary for subsistence, or experiences different positive necessities, some feeding chiefly on wheat, and some chiefly on potatoes; but whenever the supply of the food, whatever it may be, falls below a sufficiency, the supply of labourers receives a check. These results are not matter of vague conjecture, but are ascertained by figures: for example, it was found that, in Paris, during the period between 1743 and 1763, there were four years when wheat was 14 livres 18 sols for a certain measure, and during these four years the average annual mortality was 16,559; whereas, during four years in which wheat was 19 livres 1 sol for the same measure, or about a third dearer, the average annual number of deaths was 20,895. It is curious to think how the edicts of Mark Lane thus become only another kind of bills of mortality for the nation; but there can be no doubt that such is the case. Every shilling added to the price of the quarter of wheat, not compensated by an increased ability to get that shilling, numbers off an addition to the banquet of Death! If not by actual thinning of existing numbers, the check is given by the postponement of marriages. The natural rate is thus not a fixed or unvarying rate, but one determined in a great measure by the ideas and habits of the people.

The impossibility of a sudden or immediate result from either the increase or decrease of the supporting or wage fund, affects the question in an important manner. "If the supply of labour," says Mr McCulloch, "could be suddenly increased when wages rise, that rise would be of no advantage to the existing labourers. It would increase their numbers; but it would not enable them to mount in the scale of society, or to acquire a greater command over the necessities and conveniences of human life. And, on the other hand, if the supply of labourers could be suddenly diminished when wages fall, that fall would merely lessen their number, without having any tendency to degrade their habits, or to lower the condition of those that survived. But in the vast majority of instances, before a rise of wages can be counteracted by the increased number of labourers it may be supposed to be the means of bringing into the market, time is afforded for the formation of those new and improved tastes and habits, which are not the hasty product of a day, a month, or a year, but the late result of a long series of continuous impressions. After the labourers have once acquired these tastes, population will advance in a slower ratio, as compared with capital, than formerly; and the labourers will be disposed rather to defer the period of marriage, than, by entering on it prematurely, to depress their own condition and that of their children. But if the number of labourers cannot be suddenly increased when wages rise, neither can it be suddenly diminished when they fall: a fall of wages has therefore a precisely opposite effect, and is in most cases as injurious to the labourer as their rise is bene-

cial. In whatever way wages may be restored to their former level after they have fallen, whether it be by a decrease in the number of marriages, or an increase in the number of deaths, or both, it is never, except in exceedingly rare cases, suddenly effected. It must, generally speaking, require a considerable time before it can be brought about, and an extreme risk arises, in consequence, lest the tastes and habits of the labourers, and their opinion respecting what is necessary for their comfortable subsistence, should be lowered in the interim. When wages are considerably reduced, the poor are obliged to economise, or to submit to live on a smaller quantity of necessities and conveniences, and those, too, of an inferior species, than they had previously been accustomed to; and the danger is, that the coarse and scanty fare, which has thus been in the first instance forced on them by necessity, should in time become congenial from habit. Should this unfortunately be the case, the condition of the poor would be permanently depressed, and no principle would be left in operation that could raise wages to their former level, for the labourers could no longer have a motive to lessen the increase of population, as compared with that of capital; and unless they did this, it is quite impossible they could ever emerge from their depressed condition. Under the circumstances supposed, the cost of raising and supporting labourers would be really reduced; and it is by this cost that the natural or necessary rate of wages, to which the market-rate must generally be proportioned, is always regulated. In the event, for example, of a people who had been accustomed to live chiefly on wheat, being, from a scarcity of that grain, or a fall in the rate of wages, forced to have recourse to potatoes, and then, becoming satisfied with them, the standard of wages among such a people would be permanently reduced; and instead of being, as formerly, mainly determined by the price of wheat, it would, in time to come, be mainly determined by the price of potatoes. This lowering of the opinion of the labouring classes, with respect to the mode in which they ought to live, is perhaps the most serious of all the evils that can befall them. Let them become contented with a lower species of food, and an inferior standard of comfort, and they may bid an eternal adieu to every thing better. And it ought always to be borne in mind, that every reduction in the rate of real wages, which is not of a very transient description, will certainly have this effect, if its debasing influence be not counteracted by the intelligence, forethought, and consideration of the people, producing an increased prevalence of moral restraint, and a diminished supply of labourers."

If the theory of wages here described be the true one, and we believe no principle in political economy is considered as better established, we are enabled to discover very readily various things which exercise great influence over the well-being of the working classes. In the first place, it appears of the first consequence that those sentiments in the working classes themselves, which lead in the several cases to what is above described as the natural or necessary rate of wages, should not be lowered. Let the ideas of the working man as to what is a proper mode of living be kept high, and by irresistible consequence his mode of living will be high, for the number of labourers in the market will be moderate in comparison with the labour-paying fund. At the same time, it must be admitted that the increase of population has a tendency to stimulate ingenuity and exertion for the increase of the fund, so that, where ingenuity and activity exist as qualities of the people, and there is nothing to prevent these qualities from coming into play, the increase may go to a considerable length without lowering wages. This is, however, a much less certain principle, than that the natural tendency to increase of population far exceeds in force all tendency to increase of capital that has ever been exemplified on earth. In the most favourable circumstances, we know well that moral restraint is necessary—marriage itself is but a mode of moral restraint which mankind have in all ages found indispensable. Again, the greater the mental cultivation which any people experience, wages will be apt to rise or to keep high, for mental cultivation elicits qualities which tend to increase capital, at the same time that it implants moral feelings which tend to control the expansion of the population. Another point of immense consequence is, that the conduct of the people at large should be such as to allow capital the freest possible play. Every one has had experience of the natural fear and anxiety which attend the possession of however small a portion of wealth. Wherever there is danger, there wealth disappears. Wherever it cannot be employed in perfect security, and with profitable results, there it will not stay. The greatest natural advantages for its successful employment are in vain, where there is dispeace. We need only look to Ireland to see this

principle illustrated. It therefore becomes essential to the well-being of the working classes that the possessors of the fund out of which they are to be supported, should not have anything to fear, but that on the contrary the vigour of the government and the peacefulness of the people should be such as to inspire in those men the utmost possible confidence. It may be said that this is to ask a great deal from the labour class in behalf of the capital class; but it is just one of the results of human industry carried to a great and complicated extent, that a great number of human beings come into existence who depend for their support upon a thing which may vanish on the occurrence of any events calculated to give its owners uneasiness. The very charter of the being of these people is, accordingly, a conduct in all respects calculated to conciliate the confidence of capitalists. Finally, the freedom of all markets, including its own, is favourable to the interests of labour. It is true that a particular section of the community, or a particular trade, by surrounding itself with restrictions, may appear to obtain a higher share of the supporting fund than would otherwise fall to it. But the effect of all such restrictions is upon the whole injurious; and the general injury which they occasion, in the long-run tells upon the monopolists, so as to make them worse than they would have been, if there had been no restrictions.

SCENES AND STORIES OF VILLAGE LIFE.

BY MISS AGNES STRICKLAND.

WHITE-THORN FARM.

LUCY MARLOW was the eldest daughter of the wheelwright, whose neat workshops and well-stocked yard occupied an open space at the entrance of the village. There were seven in the family besides Lucy; but Isaac Marlow was a thriving mechanic, and his children constituted a part of his wealth, for his five sons assisted him in the various branches of his craft, which comprehended not only the construction of wheels, but every description of agricultural carriage, from a wheelbarrow up to a waggon. Isaac Marlow had lost his wife, but her place in the household department was well supplied by the active exertions of his daughter Lucy, who conducted the whole of the domestic affairs, assisted by a stout girl of fourteen, who had been apprenticed to her father from the workhouse. Polly Jones was an awkward uncivilised creature when she first arrived, for the children reared in workhouses are seldom instructed either in useful knowledge or decent behaviour, which is the reason why they are so often harshly treated by the persons to whom they are allotted. Such children are indeed deeply to be pitied, generally speaking; but little Polly fell into kind hands; and though at first she was very stupid, and broke many things from not having been accustomed to handle glass and crockeryware, Lucy, by the exercise of a little patience and forbearance, and some judicious encouragement, succeeded, in the course of a few months, in converting her young dependent into a valuable co-operator in her household labours, and in consequence gained time to educate her two little sisters. She also bestowed instruction in reading, writing, and sewing, on Polly, of an evening when she had finished her allotted tasks, and the morning business went on all the better for this indulgence. Polly soon became a brisk handy intelligent girl, and all the neighbours congratulated Lucy on her good luck in meeting with such a treasure, not considering the pains Lucy had taken to render her such.

Lucy was of a serene and cheerful temper, and the inward sunshine emanating from a mind at peace with itself, and the constant practice of virtuous though often laborious duties, gave brightness to her eyes, lightness to her step, and a sweetness of expression to her countenance, far more attractive than beauty. Lucy was, however, very prepossessing both in her manners and person, and her dress was always so exquisitely neat, that she was universally admired when seen, which was but seldom, beyond the precincts of the productive little garden that had been created partly by her own exertions on a slip of waste land between the dwelling-house and her father's yard. Seldom did any young farmer in want of a wife ride past on his way to Scrapeton corn-market, without pausing and thrusting his own, and of course his horse's, head and neck over Isaac Marlow's gate, as if to contemplate the merits of the carts, rollers, and gaily painted waggons, that were drawn forth in that yard to tempt the agricultural purchaser; but, truth to tell, more glances were directed towards the rows of cabbages, lettuces, or it might be the tall lilies and flaunting sun-flowers, that flourished in the trim garden in the background, where Lucy Marlow sometimes might be seen engaged in her horticultural pursuits, assisted by her little sisters Jane and Anne. But, notwithstanding these errant glances, Lucy had attained her twenty-third year without any other token of the

power of her charms, and it was the opinion of Lucy's five great brothers that Lucy would be an old maid; moreover, one of them had the incivility to tell her so.

"I hope it will be for the benefit of my family if I am," was Lucy's meek reply; "but, in truth, Hodge, I hardly know what my father and the little ones would do without me if I were to marry, of which, as you say, there is at present little chance," she added.

The fact was, Lucy had never given the slightest encouragement to those who were willing to attract her regard, because her heart had been secretly won by the silent but unmistakable attentions of a young man, who she feared would not be permitted by his friends to consult his affections in the choice of a wife; for Charles Rushmere was the eldest son of a man of sordid habits, who had amassed a considerable property by farming, and considered the increase of riches as the only duty in life.

Old Mr Rushmere lived in a distant parish, but had purchased a fine farm at Woodfield for Charles to employ himself in cultivating for their mutual profit. Charles Rushmere was a young man of excellent morals, benevolent, handsome, spirited and industrious, farmed in what was considered a good style, rode well, and was reckoned the agricultural Adonis of the village. All the damsels in his degree were disposed to set their caps at him, and their mothers said, "Poor Mr Charles Rushmere must lead a very dull life at White-thorn farm without any one to take care of him except old Sukey Scratclit, his housekeeper, and it would be quite a charity to ask him to tea in a friendly way now and then." So poor Mr Charles Rushmere was charitably invited to tea-drinkings in the parish, too numerous for us to record, and all the "young ladies," as per courtesy the daughters of the farmers and shopkeepers of Woodfield were called, did their best in turn to make impressions on the heart of the handsome heir of the rich old miser of Scrapeton Grange.

Between Michaelmas and Christmas, Mr Charles Rushmere had heard all the jingling piano-fortes, and assisted in turning over all the blue and pink and orange-coloured leaves of all the rival scrap-books in Woodfield, and stared at all the monstrous Cupids, pincushion-roses, lap-sided butterflies, and gaudy groups of oriental tinted flowers and bad prints they contained; also, he had with astonishing want of tact yielded obedience to sundry hypocritical entreaties not to read some halting rhymes to the honour and glory of the respective owners of these show-off volumes. When Christmas came, Mr Charles Rushmere was invited to a series of dances both public and private, at which he enjoyed the felicity of exhibiting his locomotive powers with every damsel in Woodfield successively, except the only one whom he considered worth a second thought, and that was the meek and modest Lucy Marlow. But Lucy never went to dances or gay tea-drinkings; her time was so fully occupied with the duties of her father's household, and the instruction of her young sisters, besides taking care of her brothers' linen, that she never had a moment to spare for other recreation than the cultivation of the garden, and sometimes a quiet walk in the meadows with her father, sisters, and her little maid, on Sunday evenings after church.

Charles Rushmere sat in the next pew to that which was occupied by the honest wheelwright and his family, and soon got into a similar habit of rambling in the meadows after they came out of church, "to help him to digest the sermon, and get an appetite for his tea," as he facetiously observed to Isaac Marlow, as if to account for this practice. The wheelwright, who had his eldest daughter, the pride and delight of his heart, on his arm, and had observed that their new neighbour's eyes had been oftener turned on her sweet face than on his Prayer-book during the service for many Sundays, had his own ideas on the motives of Charles Rushmere in joining them in their family walk; but the young man was so respectful and engaging in his manners, and confined his discourse so entirely to himself or the little girls during these rambles, that Isaac Marlow had no pretence for offering an objection to his company on such occasions. One evening, when they reached Marlow's gate, Charles Rushmere said, "I should consider it a great privilege if I were permitted to make one at your tea-table to-night, Miss Lucy."

Lucy looked down and replied, "that it was one of the rules of their family not to admit of Sunday visitors, because the evening of that day was devoted to the religious instruction of the children and the maid."

"Perhaps," observed Charles, with some degree of pique, "I should be equally unwelcome on any other evening?"

Lucy blushed and said, "that must depend on what her father thought."

"My good sir," said the wheelwright, "we are only members of what may be considered the working class, and you are the son of a rich man, one who is said to make some claim to the rank of a squire, and would probably consider us very much beneath you; therefore we must decline your company as a visitor at our humble board."

After this conversation, Charles Rushmere ceased to join the wheelwright and his family in their Sunday walks. He even went out of church by another door, and for three months looked at his book all prayer time, and at the parson during the sermon, instead of bestowing his devotions on his fair neighbour. Lucy began to think it would have been well if he had never

done otherwise, for she considered that Charles Rushmere ought to have respected both her father and herself the more for the motives which led them to decline his overtures; and so Charles did really, but, like many other lovers, he had any thing but an agreeable way of receiving a necessary repulse. Then he got angry and jealous on the score of the bachelor agriculturists whom he saw bestowing so much more attention on Isaac Marlow's carts and waggons than he considered at all requisite, and at last took the resolution of ordering one of those two-wheeled farming carriages yeleft in East-Anglian parlance a tumbril, as an excuse for obtaining admittance into the domicile over which the wheelwright's pretty daughter was the presiding genius. Charles Rushmere chose a Saturday evening, after he had paid his people, as the time for this important transaction, partly in the hope that he might find Lucy alone, and partly with a half malicious intention of catching the young housekeeper in that state of confusion with regard to the domestic arrangements which in Suffolk is expressively called a *muddle*. But Lucretia herself, when her excellent housewifery was put to the test by the unexpected visit of her lord and his royal companions, appeared not to greater advantage spinning and carding among her maidens, than did the wheelwright's fair daughter sitting tranquilly by the bright fire and clean hearth of the freshly swept and garnished stone kitchen, in her neat brown merino dress and plain white collar, superintending and assisting in darning the hose of the males of the family with her sisters.

Any of the "young ladies" of Woodfield would have been ready to faint at the idea of being surprised at such vulgar employment. Lucy certainly blushed, and allowed her ball of blue-mottled yarn to roll from her lap to the other end of the kitchen, but her confusion proceeded from pleasure at the sight of the unexpected visitor, not shame at having been discovered in the performance of one of her duties. Charles instantly rescued the ball from the impertinent playfulness of a sassy pet kitten that had just pounced upon it, and presented it to Lucy with the air of a Paladin.

"You find us very busy," said Lucy, as with a downcast glance she received this little set of attention; "but we always finish the week with our odd jobs."

"Lucy," said Little Jane, "I do think Hodge always makes such a great hole in the toe of his stocking on purpose. I never can mend this."

"Then give it to me, dear, and run the thin place in the foot of Robert's sock. That is easy work for you," returned Lucy.

Charles cast an observing glance on Lucy's proceedings, and thought how differently Sukey Scratchit would have conducted herself, if he had presumed to wear holes in his stockings of such provoking magnitude for her Saturday evening's amusement.

"Hallo, Lucy! are you giving the young squire a lesson in darning stockings?" cried Isaac Marlow in surprise as he entered, on perceiving Charles Rushmere's curly head peeping over his daughter's shoulder, his lips pursed up, and his round blue eyes intently fixed on the process of crossing the villanous hole in the toe of Hodge's Sunday hose.

It was now Charles's turn to blush, and he did blush scarlet red as he stammered out, in a genuine Suffolk whine, "Mr Marlow, sir, I hope you will excuse me, but I have come to talk to you about a new tumbril."

"Certainly," said Isaac Marlow, rubbing his hands, "that is a very excusable offence; but why did you not come to the workshop at once, where you were sure of finding me?"

It did not suit the young man to explain his reasons; so he said, "he could go and look in the workshop then, if it suited Mr Marlow."

"No," said Marlow, "we have shut up for the night, and to-morrow is Sunday; but I shall be very happy to receive your order, Master Charles, or mayhap I have a tumbril in the yard that may suit you."

"I will come and talk further on the subject on Monday," said Charles, casting a glance of intelligence at Lucy.

"Then be pleased to come to me in the workshop or yard, if you do," returned the cautious father, who had detected the telegraphing between the lovers.

"It is not every farmer who enters this house who is willing to order a new tumbril of you, Mr Marlow," rejoined the young man.

"Mine honoured customer, there is a time for all things, and a place too in my business for receiving orders, and that is the workshop, where I shall be very proud of waiting on you."

Charles was inwardly malcontent at Isaac Marlow's independent way of doing business with him, and half disposed not to give his order at all, especially as he was in no particular need of a new tumbril, and he knew his father would consider such a purchase a great piece of extravagance. However, he recollected that it would afford him a very plausible pretext for loitering in the precincts of Lucy's dwelling, if he were not permitted to enter it. So, on the Monday morning, the order was given, and once a week at least he put on his smart green shooting-frock and bright-coloured leathers, and walked into the wheelwright's yard with the free and easy air of a person who had now a right to come there, and inquired "how they were getting on with his new tumbril?" Marlow's sons thought this an exceedingly good joke; but the wheelwright shook his head, and replied at last, "not the better for your coming so often to trouble us

about it, Master Charles, and we are making all the haste we can to get it off the premises."

Charles considered this observation very uncivil, and in return caused as many artificial delays as he could, by commanding a variety of alterations, and changing his mind twice or thrice as to the colour he willed it to be painted, and all for the sake of standing opposite Lucy's window while he discussed these points, which were considered by Isaac Marlow as very blameable innovations in the orthodox plan of building tumbrils. All the farmers who were accustomed to look over Marlow's gate thought so too, and the fancies of young Charles Rushmere about his new tumbril became at length the talk of the three adjoining parishes. In due course the report reached the ears of Mr Rushmere senior; and one bright morning, when Charles, regardless of Isaac Marlow's repeated intimations that his tumbril had long been finished and ought to be removed, entered the yard with the intention of suggesting another alteration, he found his father standing before the said tumbril, and surveying it with a sarcastic countenance.

"I have done myself the honour of coming from Scrapeton Grange this morning," said he, "to look at this precious article, which has afforded a theme for so many flattering remarks on the wisdom of my eldest son."

"I hope, sir, that it meets with your approbation," returned Charles, endeavouring to assume an air of nonchalance.

"No, sir, you don't hope any such thing; for you know me too well to suppose I can approve of such needless folly and extravagance," retorted the old man with an ireful glance; "and pray," continued he, "how do you think it is ever to be paid for?"

"I shall pay for it out of my share of the profits of White-thorn farm."

"Oh, you will, sir? Then let me tell you that if you turn my liberality to so poor an account, you shall have no farm to gain any profits from another year, but your brother Frank shall come to White-thorn farm, and you shall return home to take the labouring oar at Scrapeton Grange under my own eye."

"As you please, sir," said Charles.

"No, sir; it is not as I please; for Sukey Scratchit, whom I sent here to take care of you and your house, tells me that you are tired of her, and want to bring home a wife to White-thorn farm."

"She only tells you the truth, sir," rejoined the young man. "I have bestowed my affections on the prettiest, the most sensible, and the most industrious girl in the parish, and if you are the good father I have ever had reason to consider you, you will not oppose my wish to make Lucy Marlow my wife."

"Very fine talking, but I have not laboured all my life to gain wealth that you might throw yourself away on a beggarly wheelwright's girl," replied the elder Rushmere, and, taking Charles by the arm, he led him out of Marlow's yard. Charles could have wept with shame and mortification at the thought of such a scene taking place there—within hearing of Lucy's brothers, too! Fortunately Isaac Marlow was absent that day purchasing timber, or the taunts of the sordid rich man would not have passed unanswered. There was a cloud on his brow when he sat down to supper that night, for his sons had related the particulars of this annoying affair to him, as they had before done to Lucy. Lucy's eyes were swollen with weeping. Her pride and delicacy had been deeply wounded, and she feared she had incurred her father's displeasure; but she had no cause for apprehension. Isaac Marlow was a just man, and a kind parent, and when she came to kiss him before they parted for the night, he patted her cheek affectionately, and said, "Cheer up, my Lucy; you have been a good girl and a prudent one. No one has been to blame but Charles Rushmere, in playing such boys' tricks about that foolish tumbril, and perhaps I was worse than he for taking his order. However, the tumbril is a good one, and I shall dispose of it to another person, so that need not trouble old Rushmere."

The next day Isaac Marlow wrote word to Charles Rushmere, "that, as he understood his father disapproved of the order he had given him, he had sold the article to a fancy farmer from London, and hoped he would have no further uneasiness about it."

"I hope he may dispose of his girl to the fancy farmer from London as well as the tumbril," was the elder Rushmere's obliging comment on honest Marlow's communication. Charles turned pale with vexation; for the fancy farmer, who was the son of a rich London mercer, and had recently turned an ancient farm-house into a modern Gothic cottage, with a Grecian portico, ornamented in the Egyptian style, had created a far greater sensation among the rural nymphs of Woodfield than ever Charles had done, and he feared he might prove a formidable rival in the heart of Lucy during his absence from the scene. The elder Mr Rushmere insisted on his giving up White-thorn farm for the present to his brother, and returning to the Grange. Mr Rushmere had cause to repent of this arrangement, for his son Frank, instead of bringing him either rent or profits from the farm, pursued a headlong career of dissipation as soon as he found himself in some degree his own master, formed an intimacy with the fancy farmer from London, ordered his clothes of a Bond Street tailor of his recommending, set his father and Sukey Scratchit at defiance, gave convivial parties at his bachelor abode, and, at the end of a couple of years, deeply involved himself in debt, and finished his career by breaking his neck at a steeple-chase,

which, as Sukey Scratchit consolingly observed to his father when she communicated the tragic event to him, "was the most sensible thing he had done since he came to live at White-thorn farm, and very convenient for his family just at that time, for if he had only lived another week, he was going to marry the sister of the fancy farmer's housekeeper, a very unworthy character as she understood; and then," pursued she, "all the money you have been scrubbing (Suffolk for scraping) together would have gone, you may guess where; for poor Master Charles aint likely to want it long, as I guesses by the look of him; and so, as I say, it's all as it should be, and you will have plenty of time to look about you for an heir after poor Master Charles is dead and his funeral is over."

"Does the woman mean to drive me mad by telling me of the death of one of my boys and the funeral of the other in the same breath?" exclaimed the miserable rich man of Scrapeton Grange.

"Why, lauk, sir, don't put yourself out with me, pray, for I'm sure I meant no offence by just giving you a hint, now we are talking of the death of Master Frank, that you ought not to set your mind too much on his brother, for if you haven't noticed his horrid bad looks, and his tickling cough, all the three parishes have, and they all lay the blame on your shoulders, 'cause they say he is breaking his heart for the love of Lucy Marlow and the loss of White-thorn farm together, and you would have been a happier, and, more than that, a richer man, if you had let him have them both, say I."

"Why, you vile old pic-thank, whose fault was it that I ever heard a parcel of tales about my son Charles?"

"Your own, to be sure, sir, for lending an ear to a set of envious serpents who came to set you against your own flesh and blood."

"Were not you at the very head of ear-wiggling me, you deceitful old hag?"

"What, I, sir!—well, it is a fine thing to have some one to lay your evil deeds on. As true as I'm alive, I always said Master Charles was my favourite, and well he might be, for a nicer, quieter young fellow in a house, I never waited upon. Always home and in bed by ten o'clock; always up by five in the morning, and seeing after his men, and worked harder than any of them. We had no harum-scarum doings with him. He had set his mind on a proper good girl, and that was what kept him so steady, for he bore in mind king Solomon's proverb, 'a virtuous woman is a crown of glory to her husband's head.'"

The awful termination of Frank Rushmere's reckless career caused much excitement in the parish of Woodfield, but a more general sensation of sorrow was created by the pale and melancholy appearance of Charles Rushmere at his brother's funeral.

Lucy's brothers told her he was certainly in a deep decline, and Lucy, instead of sleeping, bathed her pillow in tears that night. The next day was a beautiful May morning; the sun shone brightly, the bees were humming gaily among the newly-opened flowers in Lucy's little garden, and the birds carolled forth their songs of joy in the white-blossomed cherry-trees and the old elms that overshadowed the dwelling; her young sisters were playing with their pet-lamb on the grass plot, and the kitten frisking round them. Every thing seemed cheerful and happy except poor Lucy.

"And now," said she to her father, after the rest of the family had gone out from breakfast, "it is worse for me than if I had permitted Charles Rushmere to court me."

"Not so, my Lucy, for you have obeyed your father, and your conscience is free from offence," replied Isaac Marlow. "Have patience, Lucy, and things may even yet work together for your good."

"Ah," said Lucy, "how is that to be, if Charles Rushmere dies?"

"He is worth many dead men yet," returned her father.

Lucy was glad to busy herself in putting away the breakfast things to conceal her tears. While she was thus occupied, her sisters came running in crying, "Oh, Lucy, Lucy, what do you think?—old Mr Rushmere has sent the droildest high-backed old green shay-cart you ever saw, to fetch you to Scrapeton Grange this morning."

"Has he sent it for me?" exclaimed Lucy, turning pale. "Are you sure of that, Anne?"

"Certainly; the old man who has come to drive you told us so, and begged that you would come as quickly as possible, for his master did not wish him to lose half a day's work if it could be helped."

"Father," said Lucy, "may I go?"

"Go, my child," replied her father, "if it is your wish."

Jane had already flown to fetch her sister's Sunday bonnet and shawl, and Lucy, who was always neat, tarried not to make any change in her household garb; but almost before Mr Rushmere's envoy thought she had been made acquainted with the nature of his errand, she came forth in readiness to obey the welcome summons. Jonas gave her an approving smile, and nodded to himself as she took her seat in the antiquated vehicle by his side; and as they jolted and rumbled together out of the yard, Polly Jones testified her lively sympathy and good-will towards her young mistress, by throwing an old shoe after her for luck. Lucy was half way on the road to Scrapeton before she could command her voice to ask old Jonas "how Mr Charles Rushmere was?"

"Lord love your heart, he'll do well enough now, I'll warrant him," was the cheering reply of the sagacious driver.

"Then he is not dying?"

"Oh, lauk, no, miss! nor half so bad as I was when I was crossed in love fifty years ago. I tell you what, miss, I have heard of some young women as have fretted themselves to dead for *sick* like; but men ar'n't so tender-hearted: for, you see, miss, they has other things to occupy their time and thoughts. Not, miss, but what our young master have vexed *hissel* good tidily about you, and so our master thinks, or else he would not have bundled me off so early this morning to fetch you. But our Sukey is partly to be thanked for that, for she put it into his head that Master Charles would have a *faver* or *information* of the heart with fretting so about you, miss. Master fared very queer, I promise you, when he heard that on the night after his other son's funeral too. 'So,' says he, 'there's a real physichin from London now at the Angel, what came to see old my Lord, and we'll hear what he thinks of Master Charles: run, Jonas, and tell him to step this way.' So I gave the doctor a bit of a hint as we comed along; and when he had felt our young master's pulse, he looked wherry solemn, and shook his head. Says he, 'It is all in the heart, which have brought on alarming *simplkins* of another *natu*, for which I must write a *description*.' Then our master, when he had got the description made out, though he could not read one word of it, was forced to give doctor a golden guinea; for this was a real physichin wot was staying at the Angel, you know. Well, the *description* did our young master no good at all, as how should it! Then says old Sukey, says she, 'I can give you the best *description* for Master Charles after all, only you wot be ruled by me, sir, I s'pose.' 'But,' says master, 'Sukey, I *wool*, if you are sure it wot be too late.' Then says she to master again, 'While there's life there's hope, and to be sure you wot be a *Barbareus* Allen to your own son, now he's like to lie on his young deathbed!'

Master took her meaning, and told me to get out the old *shay*-cart, and brush it up a bit, which was only decent for me to do, for it had stood on one side in the cart-shed ever since our mistress's funeral, and the hens had got to roost along the high back of it, so that I had fine work to clean it up, as you may s'pose; and when I had got it a *little* tidy, and dusted the cushion, he ordered me to go and fetch you, Miss Lucy, the first thing in the morning."

Jonas had never in all his life met with an auditor who listened to his prosing with the interest the lovely Lucy bestowed on this narrative.

When Lucy arrived at Scrapeton Grange, she felt some trepidation at the anticipation of an interview with the father of her lover, but Jonas, as if guessing her thoughts, said, "Apray, miss, don't go to frighten yourself about our master, for it aint at all likely you'll see him."

"How so?" demanded Lucy in surprise.

"Why, our master is a very queer old fellow, but I says nothing."

Mrs Sukey Scratchit now came forth in a clean starched muslin apron and high-crowned cap, to receive and welcome Lucy, and to act as mistress of the ceremonies in ushering her into the presence of her sick lover.

Charles Rushmere, when the weeping Lucy approached the old-fashioned settee on which his emaciated form reclined, drew her gently to him, and whispered,

"She came; his cold hand softly touch'd,
And bathed with many a tear;
Fast falling o'er the primrose pale
So morning dews appear."

"Ah, Charles, if you only knew how often I have cried over that ballad of late!" sobbed Lucy in the fullness of her heart.

"If you please, Miss Marlow," interrupted Mistress Sukey, putting her head in at the door, "master desires his compliments to you, and hopes you will excuse his dining at home to-day, if so be as you and Master Charles can make yourselves comfortable to dine together alone on roast fowl, with white bacon and egg sauce, and a bread pudding, at one o'clock."

"Mr Rushmere is very kind, I am sure," said Lucy.

"And remarkably considerate too," added Charles, with a smile. "Tell him we are greatly obliged to him, and shall be very comfortable without him."

"Lauk, Master Charles, he knows that well enough; and that is the reason he goes out to-day," rejoined Mistress Sukey.

My readers may imagine how swiftly and happily the hours fled away till six o'clock arrived, when Mistress Sukey again made her appearance to announce that the shay was at the door in readiness to convey Miss Lucy home.

A few days afterwards, Charles was sufficiently recovered to be able to ride over to Woodfield to return Lucy's visit, which his father intimated to him would be only a civil thing. At the end of a month, Charles was reinstated in the occupation of White-thorn farm; and a few days after, Mr Rushmere called at the wheelwright's house, where he found Lucy very busy kneading bread, while Polly was heating the oven. The old man condescended to commend Lucy's method of making up her loaves, asked for a mug of beer in order to ascertain her skill in brewing, gave a scrutinising glance at the general neat appearance of the kitchen, and then walked off to the workshop, where he abruptly informed

Isaac Marlow "that his business with him was to hear how soon it would suit him to spare his daughter to be his son's wife."

"If you ask me when it will suit me to spare my Lucy, I should say never," was the reply of the fond parent, "for she is my greatest comfort on earth; but as it is her happiness, not my own, I should think of, I suppose I must make up my mind to part with her as soon as one of her sisters is old enough to take her place."

"No, no, Mr Marlow; my son wants his wife home before harvest; and if he can't have her now, I shall make him take some one else (that is, if I can). But I had better send him to talk to you about it, for she seems the sort of girl to suit us."

That very day Charles came and pleaded his cause so movingly to the father of his Lucy, that Isaac Marlow consented to their immediate union.

Lucy was loth to leave her father with so young a housekeeper as Anne, who was scarcely twelve years old; "but, then," as she observed, "both Anne and Jane were very handy, and had learned many useful things of her, and Polly was now seventeen, and had got into nice neat ways, and she should herself be living near enough to come and help them on baking days, and any other times when they required assistance or advice."

So the matter was settled, and on midsummer day Anne and Jane officiated as bridesmaids to their happy sister, and Polly Jones, not the least delighted of the party, gained a new gown and a white ribbon from the bridegroom.

EFFECTS OF THE NATURAL FEATURES OF A COUNTRY UPON ITS PEOPLE.

This is a subject on which Werner used to delight his pupils. It is adverted to by Dr Wordsworth, in his very beautiful work, now appearing in numbers, entitled "Greece, Pictorial, Descriptive, and Historical."* After pointing out the advantages of the climate, as producing "strength without stiffness, and softness without effeminacy," and the geographical position as favourable to intercourse with all other nations then civilised, Dr Wordsworth adds:—

"If we turn our eyes to the interior of the country, we are struck with the remarkable manner in which it is divided by the hand of nature into distinct provinces. The long ridges of mountains by which it is intersected in various directions, have traced upon its soil the lines of a natural map, which no hand of man will ever erase. Hence that distinction of tribes, differing from each other in extraction, dialect, and civil and religious institutions, with which the soil of Greece was peopled."

That the spirit of emulation and rivalry which naturally arose among these different tribes produced very important results, both for good and evil, it is not necessary to observe. While the cause of the nation, as a whole, suffered from the disunion consequent upon it, yet a love of glory and distinction was thus excited among the individual members of which the nation consisted, which led to no ignoble effects, either in arts or arms. The productions, too, of the poet and historian, gained life and vigour from the variety of dialects which were spoken by these different nations, and each of which was appropriated and consecrated, as it were, to the service of its own peculiar subject: and the political philosopher of Greece was enabled to confirm and illustrate his own speculations, by reference to the various forms of civil polity adopted by the numerous states among which his country was divided.

It would be long to inquire what facilities and encouragements were given to the cultivation of the arts by the physical properties which characterised the land of Greece. That the imaginative faculties of its inhabitants were awakened and kept alive by the remarkable phenomena which presented themselves to their view, cannot be doubted.

The volcanic fires which agitated its soil, the earthquakes which overthrew the walls of its cities, and convulsed the inmost recesses of its hills, the lakes whose inundations engulfed its plains, the rivers which forced their way by subterranean chasms through the barriers of rocky hills—to omit all reference to the majestic forms of nature in repose which daily met his eye, namely, a sky without clouds, a sea studded with numerous islands, and a land clad with thick forests—and not to mention the creations of art which so happily adorned these natural objects as to seem to be united and identified with them, as, for instance, the stately mass and the well-marshalled columns of the Doric temple rising on the hill, or the breathing statue in the grove—all these objects were to the imagination of the Greek like so many trophies of Miltiades to the mind of Themistocles; they haunted him like a passion by day, and disturbed his sleep by night; they carried him away from the region of blank abstractions, and from the contemplation of mere objects of sense, to dwell in the presence of living Powers, by whom, in his creed, all the motions of the universe were impelled and controlled.

* This is a cheap publication in the department of art. Its half-crown numbers are each illustrated by three first-rate steel engravings, and some thirty wood-cuts, done in that style of minute fidelity and exquisite finish which is at present bringing this mode of multiplying pictures into so high a place in British art. Of the descriptive literary matter the portion as yet published is too limited to allow us to form a correct judgment of its merits.

To descend from contemplating the conceptions of genius, to consider the mechanical operations of art: It was to the geological formation of its mountains, to the durable limestone rock of which they consist, that Greece was indebted for those magnificent works of military architecture—for the massy wall and lofty tower of polygonal masonry by which she defended the cities which still stand upon her hills, and which seem to rival, in permanence and strength, the mountains themselves from which their materials were hewn.

Again, it is to the rich and varied veins of marble, which streamed, in exhaustless abundance, through the quarries of Paros, of Pentelicus, of Hymettus, and of Carystus, that she owed the noblest works of her sculptors and her architects—her Parthenons and her Theatrons, her friezes of Phigaleia and of Ægina.

And as it was the wealth of her soil to which she was indebted for the existence of these beautiful creations, so it was the purity of her air which preserved them: this latter element allowed her to attract the popular eye, to inform the national taste, to inspire the faith, and evoke the gratitude of her sons, by the statues and pictures of her gods and her heroes, of her good and great men, which she placed, not only beneath roofs or within walls, not merely in the enclosures of her halls and of her fane, but on the lofty pediments of her temples, in the open spaces of her agoras, at the doors of her houses, and in the crowded avenues of her streets.

This permitted her also to decorate her buildings with the brilliant and varied hues which painting lent to her sister-art, and to imitate the clearness of her own sky, and the freshness of her own sea, by those architectural embellishments which art would not venture to adopt, except in a country alone where nature has eclipsed in brightness and vivacity of execution every thing that art can conceive."

ACCOUNT OF THE INVENTION OF THE NEW KIND OF CANDLES.

The following account of the invention of the new kind of candles lately mentioned in the Journal, has been forwarded to us from Leeds by an individual subscribing himself "A Young Chemist," a pupil of the inventor. We give it as it has been received by us, without pledging ourselves as to its perfect accuracy:—

Artificial wax, as this substance may be called, was discovered by M. E. Chevreul, a distinguished French chemist, and member of the Institute, when a very young man, and was one of the many important results of an examination into the nature of oils and fats (*Recherches sur les Corps Gras*). This examination was undertaken with a view to explain the real nature of saponification, or the conversion of oils into soap by alkalies—a subject which had long puzzled chemists, who were, consequently, unable to aid the soap-maker to improve or economise his processes. They had long known that acids combine with alkalies, and neutralise their properties; but it could never be ascertained that the combination of alkali and oil could be an example of the same law, when oil had none of the properties of an acid.

The subject was full of difficulties when M. Chevreul undertook its investigation. The substances to be examined were of a most complex nature; our information on organic chemistry was most meagre; while analysis, as applied to vegetable and animal compounds, could hardly be said to have existed. His enthusiasm and perseverance overcame every difficulty. Notwithstanding that many experimenters have followed the same path, with all the advantages of improved methods and apparatus, scarcely any new facts have been discovered, and no errors found. Indeed, his work has been cited by the celebrated Berzelius, the first chemist of the day, as the most perfect model of experimental inquiry with which the history of chemistry presents us. He found oils and fats to be composed of two substances: one solid, which he called stearine, from the fact that tallow is composed almost exclusively of it; the other liquid, existing in large quantity in oils, and hence named by him oleine. He ascertained that the oil does not combine directly with the alkali, but that its two components are converted by it into two corresponding acids, the stearic and oleic, which then combine with the alkali, like the mineral acids. He found, indeed, the analogy perfect between them in every respect. They unite with all the bases, forming compounds which differ in the degree of their solubility; with potash, for instance, a very soluble compound is formed (soft soap); with soda, hard soap, which is dissolved with more difficulty; while its combination with lime gives rise to a perfectly insoluble compound. These facts have been most important to the soap-maker in enabling him to reduce his art to scientific principles; they explain why a solution of soap may be used as a test for the purity of water; why rain water is preferred to that from the spring for washing; and why we add soda to hard water before using it with soap, for soda separates the lime which the hard water contains, and thus enables us to dissolve the soap without producing the curdy precipitate which destroys the cleansing properties of the soap.

M. Chevreul separated these acids from their compounds, and found them possessed of the following properties:—Oleic acid is a liquid, clear when pure, and closely resembling oil; stearic acid is solid, and resembles wax in so striking a manner as to be with difficulty distinguished from it. On finding he could manufacture it at a price much inferior to that at which wax is sold, he, in conjunction with M. Gay-Lussac,

another distinguished chemist, took out a "brevet d'invention" for the preparation and sale of "chandelles steariques," from which they never derived any benefit, solely on account of the name, which, merely implying candles prepared from tallow, attracted no attention; whereas manufacturers, who took up the trade after the expiration of the patent, and who announced, with less regard to truth, their productions as "bougies," or wax candles, speedily made large fortunes; a proof, and many more of the same kind might be adduced, that those were wrong who asked, depreciatingly, "what's in a name?" Does the reader wish to prepare and examine this artificial wax himself? Nothing is more easy. He has only to dissolve a little hard white soap in hot rain or distilled water, and to the clear solution, while hot, add some vinegar, or other acid. The stearic being a weak acid, is easily separated from its combination with soda, as it exists in soap. Acetate of soda is formed, and the stearic acid rises to the top of the liquid as an oily substance, which, on cooling, solidifies into a cake of artificial wax, mixed with a certain portion of oleic and impurities, which render it softer than if this fluid had been expelled by pressure. A similar process is pursued on a large scale, but regard must be had for economy. The tallow is saponified, not by soda or potash, as in the preparation of soap, but by quick-lime. It is only necessary to boil the lime, tallow, and water, in a large vessel for some hours, when these ingredients are converted into a kind of hard soap. From this substance, stearate and oleate of lime, also the stearic and oleic acids, are separated by the addition of oil of vitriol. They are melted like tallow, run into cakes, and subjected to the press, which separates all impurities, and leaves the stearic acid as pure and white as the finest bleached wax, which may be used immediately for the formation of candles. In France, besides plaiting the wicks, they are dipped in a solution of borax, and then dried. The borax fuses during the combustion, and, forming a globe on the summit of the wick, assists by its weight to bring it out of the flame in contact with the atmosphere, and thus insures perfect combustion, and obviates the necessity of snuffing.

It was found that the artificial wax generally crystallised in the moulds, a circumstance which prevents the formation of a solid candle. In England this difficulty was overcome in some cases by the addition of arsenic. The French, more scientific than we, had recourse to their knowledge of the laws of crystallisation for the remedy. It is known that regular crystallisation only takes place when the transition of the mass from a fluid to a solid state is so gradual as to allow time for its molecules to arrange themselves in those determinate forms called crystals: this condition was fulfilled in the cooling of the moulds and their contents, but by plunging them in cold water as soon as the melted stearic acid had been poured in, crystallisation was prevented, and a perfectly solid candle procured. No arsenic, as far as I am aware, is now used in the manufacture of the candles in England.

MR BUXTON'S NEW WORK ON THE SLAVE-TRADE.*

THE first purpose of this volume is to show that the slave-trade, while really abolished in the British dominions, and professedly so in some others, is, upon the whole, carried on to a greater extent, and is moreover productive of a much greater amount of human misery, now than at any former period. A second object of the author is to prepare the public mind for a new and effectual means of putting down the trade.

With regard to the extent to which the trade is carried on, Mr Buxton presents a series of quotations from public papers, showing that into Brazil, in the year ending June 30, 1830, the number of slaves imported was 78,331, besides an unknown, but presumably large number who were smuggled. Since then, notwithstanding a treaty entered into on the subject, the number imported into Brazil is allowed on all hands to have greatly increased. Mr Buxton, nevertheless, sets down the number imported into Brazil as only 78,331. He then shows data which make it probable that the number imported into Cuba is not less than 60,000. These, united to other numbers for slaves intercepted or destroyed on the voyage, and to 50,000 for those carried to Mahomedan states, give 200,000 as the annual amount of human beings sent out by Africa as slaves—a number which, from many circumstances, appears considerably below the truth, though documentary evidence will not allow of a higher one being assumed.

Mr Buxton then proceeds to show that, after all, this statement of numbers affords but an inadequate idea of the extent of evil produced by the slave-trade. In the first place, the obtaining of slaves in Africa is the cause of tremendous internal wars, productive, like all wars, of great mortality, as well as repressive of all social improvement. The strong assault and capture the weak; often, in order to obtain young persons, the whole of the remainder of a little nation, men, women, and children, are massacred: the face of the country is covered with desolation. The compensation for

these evils consists in ardent spirits, tawdry silk dresses, and paltry necklaces of beads. Denham, the African traveller, says that on one occasion twenty thousand negroes were killed for sixteen thousand carried away as slaves. On the march to the coast, the captured wretches experience dreadful cruelties, and die in great numbers. It has been calculated by M. Mendez, the author of a learned treatise on the mortality of negro slaves, that five-twelfths or nearly a half of those captured die before reaching the coast.

The section respecting the seizure of the people for slaves, is the most interesting in the book; it comprehends the details given by Park, Clapperton, Lander, and other African travellers, besides many derived from the reports of missionaries and other individuals to the African Society. The following, which may serve for a specimen of all, and which refers to the slave-capturing expeditions of the troops of the Pacha of Egypt, is translated from a recent French work, the composition of Count De Laborde, to whom the information was communicated by a French officer who went to Cairo in 1828, and resided for ten years in the country of Mohammed Ali.

"M. — there (in Egypt) learnt that four expeditions, called gaswahs, annually set out from Obeid, the capital of Kordofan, towards the south, to the mountains inhabited by the Nubas negroes. The manner and object of their departure are thus described: One day he heard a great noise; the whole village appeared in confusion; the cavalry were mounted, and the infantry discharging their guns in the air, and increasing the uproar with their still more noisy hurrahs. M. —, on inquiring the cause of the rejoicing, was exultingly told by a follower of the troop, 'It is the gaswah.' 'The gaswah! for what—gazelles?' 'Yes, gazelles; here are the nets, ropes, and chains; they are to be brought home alive.' On the return of the expedition, all the people went out, singing and dancing, to meet the hunters. M. — went out also, wishing to join in the rejoicing. He told Count Laborde he never could forget the scene presented to his eyes. What did he see? What gain did these intrepid hunters, after twenty days of toil, drag after them? Men in chains; old men carried on litters, because unable to walk; the wounded dragging their weakened limbs with pain, and a multitude of children following their mothers, who carried the younger ones in their arms. Fifteen hundred negroes, corded, naked, and wretched, escorted by 400 soldiers in full array! This was the gaswah; these the poor gazelles taken in the desert. He himself afterwards accompanied one of these gaswahs. The expedition consisted of 400 Egyptian soldiers, 100 Bedouin cavalry, and twelve village chiefs, with peasants carrying provisions. On arriving at their destination, which they generally contrive to do before dawn, the cavalry wheel round the mountain, and by a skilful movement form themselves into a semicircle on one side, whilst the infantry enclose it on the other. The negroes, whose sleep is so profound that they seldom have time to provide for their safety, are thus completely entrapped. At sunrise the troops commence operations by opening a fire on the mountain with musketry and cannon; immediately the heads of the wretched mountaineers may be seen in all directions, among the rocks and trees, as they gradually retreat, dragging after them the young and infirm. Four detachments, armed with bayonets, are then dispatched up the mountain in pursuit of the fugitives, whilst a continual fire is kept up from the musketry and cannon below, which are loaded only with powder, as their object is rather to dismay than to murder the inhabitants. The more courageous natives, however, make a stand by the mouths of the caves, dug for security against their enemies. They throw their long poisoned javelins, covering themselves with their shields, while their wives and children stand by them and encourage them with their voices; but when the head of the family is killed, they surrender without a murmur. When struck by a ball, the negro, ignorant of the nature of the wound, may generally be seen rubbing it with earth till he falls through loss of blood. The less courageous fly with their families to the caves, whence the hunters expel them by firing pepper into the hole. The negroes, almost blinded and suffocated, run into the snares previously prepared, and are put in irons. If after the firing no one makes his appearance, the hunters conclude that the mothers have killed their children, and the husbands their wives and themselves. When the negroes are taken, their strong attachment to their families and lands is apparent. They refuse to stir, some clinging to the trees with all their strength, while others embrace their wives and children so closely, that it is necessary to separate them with the sword; or they are bound to a horse, and are dragged over brambles and rocks until they reach the foot of the mountain, bruised, bloody, and disfigured. If they still continue obstinate, they are put to death.

Each detachment, having captured its share of the spoil, returns to the main body, and is succeeded by others, until the mountain, 'de battue en battue,' is depopulated. If from the strength of the position, or the obstinacy of the resistance, the first assault is unsuccessful, the general adopts the inhuman expedient of reducing them by thirst; this is easily effected by encamping above the springs at the foot of the mountain, and thus cutting off their only supply of water. The miserable negroes often endure this siege for a week, and may be seen gnawing the bark of trees to extract a little moisture, till at length they are com-

pelled to exchange their country, liberty, and families, for a drop of water. They every day approach nearer, and retreat on seeing the soldiers, until the temptation of the water shown them becomes too strong to be resisted. At length they submit to have the manacles fastened on their hands, and a heavy fork suspended to their necks, which they are obliged to lift at every step. The march from the Nuba mountains to Obeid is short. From thence they are sent to Cairo. There the pacha distributes them as he thinks proper; the aged, infirm, and wounded, are given to the Bedouins, who are the most merciless of masters, and exact their due of hard labour with a severity proportioned to the probable short duration of the lives of their unhappy victims.

At Obeid alone, 6000 human beings are annually dragged into slavery, and that at the cost of 2000 more, who are killed in the capture. The king of Darfur also imports for sale yearly 8000 or 9000 slaves, a fourth of whom usually die during the fatigues of a forced march: they are compelled, by the scarcity of provisions, to hurry forward with all speed. In vain the exhausted wretches supplicate for one day's rest; they have no alternative but to push on, or be left behind a prey to the hungry jackals and hyenas. 'On one occasion,' says the narrator, 'when, a few days after the march of a caravan, I rapidly crossed the same desert, mounted on a fleet dromedary, I found my way by the newly-mangled human carcasses, and by them I was guided to the nightly halt.'

The above are old-established evils: what follows is new. When the slave-trade was not forbidden, the vessels employed to carry the slaves from Africa to the colonies, not being under any fear of confiscation, were built on a principle of capacity, and the ordinary allowance of room was comparatively liberal. British vessels, of 150 tons and under, were not allowed to carry more than five men to every three tons. Now, from the danger of seizure, slave-vessels are built on a principle of quick sailing, and the space allowed for the slaves is much less than it was. They are strung upon a chain, of which each is allowed only one quarter of a yard, and lie between the decks almost as closely packed as herrings in barrels, the only posture being on one of their sides. The disgusting filth and misery, the sickness and mortality, which result from these arrangements, are dreadful. Formerly, one fourth was calculated to be the amount of loss of life on the voyage; now, a slave considers himself well off if he saves a third of those embarked, and fortunate if he retains a half. And often, when chased, these gentlemen scruple not to lighten the vessel by throwing a number of the slaves overboard: instances have even occurred, and that at no distant date, of their throwing over the whole; a measure to which they are tempted to have recourse by a law which makes it impossible for a cruiser to seize them if they have no slaves on board.

Mr Buxton also makes calculations of the mortality which occurs amongst the captives while waiting to commence the voyage, and of that which takes place while they are getting "seasoned" for labour on the plantations. Even when rescued by British cruisers, he shows that the poor wretches are still liable to great misery and a high rate of mortality. In his summary, he comes to the conclusion that the loss of life in the seizure, march, detention on the coast, the voyage, and in seasoning, amounts in all to 145 per cent. In other words, out of every 245 slaves carried away from Africa, 145 die or are killed before reaching the place of their final destination. The total annual loss to Africa he makes out to be not much less than half a million; and he adds, "Even this is but a part of the total evil. The great evil is, that the slave-trade exhibits itself in Africa as a barrier, excluding every thing which can soften, or enlighten, or civilise, or elevate the people of that vast continent. The slave-trade suppresses all other trade, creates endless insecurity, kindles perpetual war, banishes commerce, knowledge, social improvement, and, above all, Christianity, from one quarter of the globe, and from 100,000,000 of mankind."

The amount of slaves imported into various colonies and countries when Wilberforce and Clarkson commenced their labours, was only about 70,000, or at the most 80,000, instead of being, as now, 200,000. "Millions of money, and multitudes of lives," says Mr Buxton, "have been sacrificed, and, in return for all, we have only the afflicting conviction that the slave-trade is as far as ever from being suppressed." * * Hitherto we have effected no other change than a change in the flag under which the trade is carried on: or, it may be added, a change in the place of destination; that is, instead of being carried to the British West Indies, the slaves are now taken to Cuba or South America. The French and Spanish flags have been used in succession; and now the greater part of the trade is carried on under the flag of Portugal, which sells the privilege at a fixed rate. An universal combination to put down the trade is not, Mr Buxton thinks, to be hoped for; and even if such a measure were to be effected—even were the trade to be every where treated as piracy, he believes that the deportation of slaves would still be carried on, in consequence of the irresistible temptation which its profits hold out to private enterprise. It is an axiom at the custom-house that no illicit trade can be suppressed if the profits exceed 30 per cent. Now, the profits of the slave-trade are many times 30 per cent. Mr Buxton states an instance, taken up apparently at random, in which 180 per cent. of profit was realised. We fully believe that this is an effectual reason why the slave-

* Murray, London. 8vo. Pp. 240.

trade cannot be put down. While all men are extremely reluctant to meet certain death, some are never wanting who will readily enter into enterprises involving almost any amount of risk of that calamity.

The new plan for extinguishing the trade proposed by Mr Buxton, has reference, not to civilised mercantile powers, but to Africa itself. He is of opinion that the trade would cease, if the native chiefs could be convinced that a more profitable trade would arise if this were put down. He enters into statements showing the immense capabilities of Africa as a productive country, above what we have ever had any experience of, and shows that the quarter million of British exports now sent to it is but a trifle compared with what, in fair circumstances, it ought to take. With respect to the means requisite for impressing the African chiefs with a sense of the superior advantages of a more convenient trade, he does not consider himself at liberty to unfold them in the present volume, as they are now under the consideration of the government, but he promises fully to develop them in a subsequent publication. We must confess that we do not well see how a task so great and difficult as that suggested by Mr Buxton is to be set about, but every one must be quite willing to listen to the scheme, and give it their best consideration when it is placed before them. Meanwhile, Mr Buxton has presented to Humanity the startling fact that all her efforts of the last fifty years to diminish the miseries arising from slavery, have been defeated by Cupidity, and that hundreds of thousands of human beings are still the annual victims of that detestable traffic.

SKETCHES IN NATURAL HISTORY.

THE SILK-WORM.

THIS little creature, whose labours are of such incalculable value to mankind, is supposed to have been indigenous to China. In that country, at least, the discovery was first made, that the product of the silk-worm's operations could be elaborated into articles of human attire, richer and more beautiful than any to be derived from other sources. At an early period a considerable commerce was established in silk between eastern and western Asia, from which latter quarter it was conveyed to Europe; but not until the sixth century of the Christian era, was it distinctly known by Europeans that the splendid tissues which they had worn for more than a thousand years, and which they had even partially manufactured from the raw transported material, were the product originally of a worm. The first silk-worms seen in Europe were brought from China in the year 552, by two Persian monks, who had gone thither as Christian missionaries, and who contrived to secrete a number of the silk-worms' eggs in a cane, and to escape with them to Constantinople. From these few eggs have sprung all the successive generations of silk-worms which have supplied silk to Europe from that period to the present time.

The valuable insect whose history has been thus briefly detailed, receives from naturalists the appellation of *bombyx*. It is of the caterpillar tribe, and, like its congeners, passes through a number of transformations in the course of its existence. Its first state is that of the larva or caterpillar, which it enters into on leaving the egg; its second state is that of the pupa or *chrysalis*; and its third state is that of the imago or moth. The silk-worm moth is of considerable size, and is of a greyish colour. The female moth deposits its eggs on the mulberry tree, the leaves of which, as will be afterwards explained, form the sole subsistence of the silk-worm. This deposit, when the creatures are not under artificial management, is made about the middle of summer, and the eggs of one moth usually amount in number to three or four hundred. They are about the size of mustard-seeds, and at first yellow in colour, but afterwards assume a bluish-grey cast. Being fastened by a sort of glue to the spot, the egg of the silk-worm retains its position in spite of wind and rain, until the period for the hatching of the young caterpillar. After autumn and winter are past, the egg opens in May, and the worm which issues is about a quarter of an inch in length, thin in body, and of a blackish tint. It soon shows a desire for food, and begins to feed on the mulberry leaves, though without exhibiting any inclination to roam from the spot where it first came to life. For eight days it continues to feed with avidity, and increases to nearly twice its original magnitude. At the end of the time mentioned, it falls into what is called its first sickness, and leaves off eating for three days, when it casts its first skin. This moulting is repeated four times, at regular intervals, before the worm attains the complete caterpillar state, which commonly takes place about a month after the hatching of the worm. The reason of these successive moultings is to be sought for in the rapid growth of the worm, which increases

its bulk many thousand fold during these changes. The original skin, when once become hardened, could scarcely have been distended at a rate sufficient to accommodate the augmenting size of the creature, and therefore a number of coverings have been provided in embryo to obviate the difficulty. The plan which the worm takes to get out of its skin, is to fasten the latter to the leaf by a sort of silky glue, which holds it fast, until the inmate rubs its head against the leaf, breaks off the scales, and finally drags through its whole body.

Ten days after its fourth moulting, the worm attains its complete caterpillar state, and is then about two and a half inches long, with twelve parallel and equidistant membranous rings round its green body, and sixteen legs arranged in pairs, of which the five posterior ones are moveable, and the three anterior pairs scaly and unmoveable, serving seemingly for supports only. The caterpillar has fourteen eyes, seven on each side of the head, and along the body are eighteen holes for the creature's breathing; each hole being connected with some kind of respiratory organ. The mouth is placed vertically, and the jaws are indented like the teeth of a saw. Immediately beneath the mouth are two small holes, placed close to each other, and through which proceeds the silk which the creature spins. These holes are connected with two bags or tubes in the interior of the body, in which is secreted the yellow gummy substance which constitutes the silk. These tubes or bags are of great length in comparison with the animal's body, being each about ten inches long. They are wound round a portion of the intestines as on a spindle, and do not communicate directly with the external holes, but by means of a sort of grater, pierced with many openings, through which the silk-gum is drawn out in many filaments, to be united as they issue by the external aperture into one thread.

Having fed itself, during the ten days subsequent to the last moulting, up to the full size, the caterpillar, constituted as we have described, begins to feel the stimulus of nature urging it to the next change of its condition, which is necessary to bring it to the moth or butterfly state, and which is accompanied with operations most beneficial to the human race. The caterpillar seeks a corner or angular spot in which to begin its spinning. Having settled this point, it weaves a number of irregular threads around the place, to be a support to its future tenement. The mode in which it does this is by fixing a portion of the gum or silk on a certain point, and then by receding from the spot, or turning its head and body, draws out the thread by the two holes already alluded to. Separate filaments issue from these apertures, but the animal is provided with a hook at the edge of its mouth, with which it unites them into one. In one day the caterpillar, proceeding with its work, weaves a pretty thick layer of loose silk, called the floss silk, in the oval interior of which the creature of course remains. For the whole of the succeeding three or four days, it is occupied in spinning the cocoon, or solid ball of silk, which is man's valuable prize. This cocoon is seldom above three grains in weight, yet, when unrolled, the filaments composing it are sometimes found to be more than a mile long! This shows the wonderful celerity with which the caterpillar must emit the material during its three days' operations. It takes the quickest way of working, and that most easy for itself, spinning the thread not in regular circles, which would demand an extensive motion of the body, but in short wavy lines from point to point. The whole cocoon is usually less in size than a pigeon's egg, and is of a yellow hue. Having effected this great work, and shut itself up within a strong and firm covering, the caterpillar, much decreased in bulk by this extensive and uncompensated excretion, prepares for its final change. It throws off its last caterpillar case within a few days after the completion of the cocoon, and assumes the chrysalis form. It is now an oblong, soft, brownish body, without limbs, apparently, or power of motion. Its members, however, exist in embryo, and in about twenty days they develop themselves fully, and the chrysalis becomes a perfect moth or butterfly. By the use of its hooked feet, and its head, it then separates the filament of the cocoon and makes its way into light and life, the winged creature of an hour, seeming to have little other purpose in its existence but to seek a mate, that new eggs may be produced for the continuation of the race. This it does immediately on coming to light.

The product of the silk-worm's labours, such as they have now been described, was a thing of too much value and importance not to attract the attention of man to the means of improving and increasing the fruit of the insect's operations. The Chinese, the first discoverers of the value of the silk-worm, have long pursued artificial modes of ensuring the regularity of the silk produce. In Europe, also, and in many other parts of the world, for the last thousand years, the rearing of the silk-worm has been the object of the most anxious and unremitting attention. It has been stated that these insects feed on mulberry leaves alone: the culture of the mulberry tree, therefore, is an essential preliminary to the artificial rearing of silk-worms, and on this account a few words may first be devoted to the point. The mulberry, or *morus*, in botanical language, is well known as producing a fruit much in use in European countries. There are several varieties of the tree, distinguished by the colour of the fruit they produce, one yielding a black fruit, a second a white fruit, and a third a red fruit. There

are two or three other species, but the white, which appears to have come originally from China, is considered by far the best food for silk-worms, although most of the other varieties have been found also to sustain them. The white-fruited mulberry, therefore, which bears broad, smooth, and pointed green leaves, has been most extensively planted in those parts of Europe where the silk-worms are habitually reared. The tree may be easily raised, either by cuttings, layers, or by seed, and that in any warm or temperate and regular climate. Its leaves cannot be used without injury to the tree before the fifth year, when they usually appear in great plenty in the beginning of May. Mulberry trees have often two crops of leaves in the year, and indeed, in very warm climates, the tree produces fresh leaves all the year round, thus permitting the artificial breeders of worms to obtain several crops of silk in a year. Old trees afford the best leaves, but in France and Italy the mulberry plantations are usually allowed to attain a size most inconvenient for the plucking of the leaves, which might be prevented by proper cutting of the trees. Pruning always improves the quality of the leaves, about thirty pounds of which may be procured from a healthy well-grown tree. As might be supposed, many experiments have been tried, by engrafting and other means, to improve the mulberry; and one fact, at least, has been ascertained, that the process of engrafting, under all circumstances, does good.

Having an ample provision, in expectancy, of mulberry leaves, the silk-worm itself is the next object of care. The attention required in the management of these insects is indeed great and incessant. If the eggs, for example, from which the brood of the season is expected, be hatched a few days too soon, by a slight mismanagement of temperature, the whole hopes of the cultivator will be ruined. His leaves and his worms must be ready for one another to an hour almost. The eggs of silk-worms are a marketable article, and experienced men can tell good from bad ones, as easily as merchants can determine the quality of mustard seeds. It is by confinement of the moths to particular spots that the eggs are procured, the insect being necessitated by situation to deposit them on paper or on cloths. They are then gathered, and placed in such situations as may prevent them from being hatched until the mulberry leaves are ready. It has been found that one of the best ways of effecting this object is to place the eggs in sealed glass vessels, kept continually immersed in cold water. When the proper season for bringing on the hatching arrives, the eggs are taken out of the phials, and separated from one another by washing. It is common, also, to use a little wine in order to free them of the gum which adheres to them, and which renders the shell more difficult for the worm to break. The eggs, previously dried, are then taken to the stove-room, where they are exposed to a gradually increasing temperature, until they grow white, which is the signal of the approaching outbreak of the worm. Muslin is now laid over the eggs, and above this muslin a quantity of mulberry leaves. As soon as the worms are hatched, they crawl through the muslin, and attach themselves to the leaves. In one or two days, all the healthy worms will be out of their shells.

The feeding-room is the place to which the worms are now conveyed. This apartment should be dry and well ventilated, but at the same time closed against the access of ordinary insects. It should contain proper shelves, also, for the reception of the worms. Young and tender leaves are given to the worms at first. Through the whole period of their transmutations, their food is chopped small, a great saving of leaves being thus effected. They are fed regularly three or four times a-day, and consume, during the period of their moultings, a quantity of food which would appear wonderful, did not one remember the vast increase which takes place in their bulk. The same number of worms which will be satisfied with one pound of leaves previous to their first moulting, will consume one hundred and eighty-three pounds during their last feeding interval, before the commencement of their spinning. For their convenient performance of the latter operation, bushes of broom or brushwood are erected on the shelves, being usually bent over in an arched form. In corners of these bushes, the worms arrange themselves, and there they go through the process of manufacturing their cocoons. In three days their labour is finished, and in a few days afterwards the cocoons are carefully gathered from the bushes. One-sixtieth part of them is set aside for breeding, and the remainder are exposed to a strong heat, in order to extinguish the vitality of the chrysalis within, previous to reeling off the silk. In separating the breeding portion, care is taken to select partly males and partly females, the cocoons of the former being known by being pointed a little at the ends. When the moth breaks out, care is taken to make it deposit its eggs where they can be gathered, and laid aside for the next season. The moth soon dies, having fulfilled its object—no mean one—in creation. It seldom lives two days, taking the while no food that can be observed.

It has been stated that one cocoon sometimes yields filaments a mile in length. More commonly, however, six hundred yards is about the extent of the largest cocoons. Twelve pounds of cocoons yield one pound of silk, by the ordinary computation. The silk differs considerably in quality, and the cultivators sort the cocoons, accordingly, into distinct lots, being guided by the observation of colour and other circumstances. When brought to the market, these various kinds are

readily known by the purchasers, and bring prices proportionate to their value.

The rearing of silk-worms, conducted in a manner more or less resembling that now detailed, has long flourished in various parts of Europe, but never, for any length of time, has it succeeded in our own country. James I. endeavoured to naturalise the silk-worm in England, but after a time the attempt was given up. Various trials of the same kind have been since made, both publicly and privately, but without attaining to any permanent success. It would appear, upon the whole, that our climate is too cold, or at least too variable, for this branch of industry, both as regards trees and worms. In France the rearing of silk-worms is an important pursuit to the people of the southern departments. Of late years great advances have been made there in the production of raw silk. In the year 1812, France produced 987,000 pounds weight of raw silk; in 1828, the produce has been estimated at 2,700,000 pounds weight; in consequence of which great increase, the country is not necessitated to import one-tenth of foreign silk, where it used to import one-half, for its internal consumption and the employment of its looms. In Italy, Sicily, and Turkey, considerable quantities of raw silk are produced from the worms. From all the countries mentioned, England procures the raw material, either by fair trade or smuggling; but her chief supplies come from her East Indian possessions, from China, and from other oriental countries. Feeling still the want of more extensive supplies, English enterprise has been the means of recently introducing the mulberry tree into the islands of Malta and St Helena, and there are strong hopes that ere long a large addition of raw silk may be thrown into British hands from these quarters. At present, the people of the United States seem to have become keenly alive to the advantages of rearing the silk-worm within their own territories, and thus finding home-silk for their home-consumption. They have already succeeded to a considerable extent, and undoubtedly, with the variety of climate at their command, they may push this branch of industry to any point they choose.

Since this little creature's produce has become truly a necessary of life, these matters are not unimportant to British comfort and commerce, and, for the same reason, we hope that these details about the history of the silk-worm will not have proved uninteresting to the readers of the Journal.

SECOND MARRIAGE OF THE FATHER OF PETER THE GREAT.

THE Czar Alexei Michailovitch, father of Peter the Great, was so much attached to the nobleman Artemin Matfeof, that, contrary to the etiquette of the Russian court, which forbids the czar to visit a subject, he would often go to his house in a friendly and familiar way. One evening, coming in unexpectedly, and seeing the table set for supper with great neatness, he said to Matfeof, "The table seems so neatly and prettily covered, I feel a strong desire to sit down to it with you. Yes, I will follow the suggestions of my appetite, and place myself at table by thee, upon this condition, however, that I disturb nobody, and that none get up from table till they have supped." "Whatever your majesty pleases and commands must be to the honour of my house," returned Matfeof. The supper was served up, and the czar sat down to table. The mistress of the house enters, with their only son, and a young lady, who, after making their profoundest reverences, obey the czar's commands, and take their places at the table. During the supper, the czar looked frequently round upon the little company, and seemed to take particular notice of the young lady that sat over against him, as not recollecting that he had ever seen her before as one of Matfeof's children. "I always thought," said his majesty, "that thou hadst no other child than that boy, but now I see, for the first time, that thou hast a daughter likewise: how camest thou never to mention her to me?"

"Your majesty thought perfectly right," answered Matfeof: "I have but that one son. But the young lady that sits opposite is the daughter of my friend and relation, the nobleman Kyrilla Narishkin, who lives in the country on his estate, whom my wife has taken into the house, to show her the city, and, in God's good time, to get her well provided for."

The czar said nothing more, than that "he had done a good deed, which therefore must be agreeable to God." After supper, when Matfeof's family were risen from table, and gone to their own apartment, the czar chose to continue sitting with his host. His majesty resumed the subject of the young lady, Natalia Kyrillovna, and said, "The maiden has a handsome appearance; she seems to have a good heart, and is not too young to be married. Thou must endeavour to get her a fit husband." "Yes," answered Matfeof; "your majesty judges rightly of her: she possesses an excellent understanding, with the greatest modesty, and the best of hearts. My wife, and the whole family, are uncommonly fond of her, and consider her as if she were our darling daughter. But as to a suitor for her, that is what we are not soon likely to expect. She has indeed numberless good qualities, but little or no wealth; and if I should meet with an opportunity to settle her, the portion I could afford her out of my narrow fortune would be but small." The czar upon this replied, "She must find a sweetheart that has so much property himself as to stand in need of nothing from her, but

consider her good qualities as the greatest and best of portions, and make it his endeavour to render her happy." "That is just what I could wish," said Matfeof; "but where shall I find such a lover, who looks more for excellent qualities in his bride than for a splendid fortune?" "Oh, yes," said the czar, "they are still to be found very frequently: do thou think occasionally thereupon, and I myself will likewise look out for some such match. The maiden is deserving of all the pains we can take to make her happy." Matfeof thanked his majesty for so gracious an intimation of his kindness, and there the matter remained. The czar wished him a good night, and took himself away. A few days afterwards his majesty came again to Matfeof, discoursed with him for a couple of hours on state affairs, and, after getting up, seemingly with a design to take leave and go away, on a sudden took his chair, and sat down afresh. "Now, tell me," said he to Matfeof, "hast thou not forgot our late conversation about providing a lover for Natalia Kyrillovna?"

"No, most gracious sir," answered Matfeof; "I bear it continually in mind, and only wish it were to some effect. I have found nothing suitable for her yet, and I much doubt that a proper offer will soon be made; for though a number of our young noblemen come to visit me, and consequently often see my charming foster daughter, they none of them give any intimations about marriage."

"Well," said the czar, "perhaps it may not be necessary. I told thee that I would myself use some endeavours to provide a bridegroom for her. I have had the good fortune to find one, with whom she will probably be very contented and happy. I know the man: he is an honourable and worthy person, has merit, and wealth enough not to be under the necessity of asking an estate or portion with her. He loves her, and will marry and make her happy. Thou knowest him too, though probably he hath hitherto not discovered his intention to marry. I think, likewise, that when he applies to thee, thou wilt not give him a denial." Matfeof here interrupted the czar, by saying, "As I just told your majesty, that would be a most desirable thing; it would free me from a great concern I have continually at heart about this poor girl. Dare I now beseech your majesty to tell me the man's name? Perhaps I know him likewise, and can inform your majesty something of his circumstances."

"I have told thee that I know the man," returned the czar; "that he is a worthy honest fellow, and capable of rendering his wife happy: this thou mayest take my word for. I can say no more of him, till we know whether Natalia Kyrillovna will be willing to have him."

"There is no doubt of that," returned Matfeof, "when she hears that your majesty has provided her a spouse. In the meantime, she must know who the person is, that she may give her answer. This, I think, is but reasonable."

"Well, then," said the czar, "I give thee to know that I myself am the man that hath resolved to marry her, if she be inclined to it. Do thou tell her this, and ask her whether she can approve of me."

At this unexpected declaration of the czar, Matfeof was filled with astonishment, threw himself at his feet, and said, "I beseech your majesty, for the love of heaven, that you will change your resolution, or at least that you will not order me to acquaint the young lady with it. Most gracious sovereign, you know full well that I have already a great many enemies at court, and among the principal families of the empire, who are jealous of the favour and confidence your majesty is pleased to allow me. What an outcry will there be among them when they find your majesty has preferred a marriage with a poor maiden of my family to a connection with one of the principal ladies at court! Doubtless their hatred and malice against me will cover all the land; and every one will think that I have abused your majesty's favour, and unworthily contrived to bring about the match, for the sake of raising myself still higher in your majesty's regard, and for elevating my family to a connection with that of the czar's."

"All that will nothing signify," replied the czar: "the affair is mine, and thou hast no business with it. My resolution is taken, and thereby I shall remain."

"Well, be it according to your majesty's pleasure," said Matfeof; "and may God bless your majesty with every kind of prosperity! Since it is to be so, let me beg only one favour for myself and for Natalia Kyrillovna, which is, that your majesty will proceed in the matter according to the custom of the empire, and with as little noise as possible, by ordering a number of the marriageable young ladies of the principal families, and among them Natalia Kyrillovna, to appear together at court, with the design of choosing one of them for a bride; and, in the meantime, that no person besides your majesty and myself, not even Natalia Kyrillovna, have the slightest intimation of your purpose and resolution."

The czar found this procedure highly proper, and accordingly bade Matfeof be prepared for the event, and to discover his intention to no one. A few weeks afterwards, he declared his design of marrying again to the heads of the church and his chief ministers in a private council, and further told them that on such a court day all the marriageable daughters of the chief nobles were to be commanded to appear at court, that his majesty might consider them, and choose a bride.

This was accordingly done on a certain day in September 1670, in the Kremlin palace at Moscow, when sixty noble ladies presented themselves in their most

superb attire, and among them Natalia Kyrillovna Narishkina in neat and pretty apparel. They were all sumptuously entertained by the czar; but Natalia was declared to be the monarch's bride.—*Gentleman's Magazine*, 1789.

BILLARD'S ADVENTURE IN A WELL.

THE story of the unfortunate Dufavel, who was buried accidentally in a well, and remained in it for a long period [see Journal, No. 259], is not without a parallel in the history of mining transactions in France. In the department of the Indre, and parish of Fleure-la-Riviere, March 27, 1837, about half-past eight in the morning, Etienne Billard, a working mason, descended a well one hundred and twenty feet deep, for the purpose of examining it preparatory to some repairs. When he had reached the bottom, or nearly so, an extensive portion of the sides fell in upon him, and shut him out from the light of day; but, by a remarkable piece of good fortune, the materials, in falling, formed a small arch of about three feet in diameter around his head. Had it not been for this, he would have been either fatally hurt by the heavy stones of the masonry, or would have been suffocated immediately. Every other part of the well around his body was filled compactly with the fallen materials. The noise of the irruption was heard by some workmen near the spot, who immediately ran up to it. On listening intently, they heard the cries of Billard, and the certainty that he was yet alive inspired the hope of delivering him. Sending off one of their number to alarm the neighbouring inhabitants and authorities, these workmen then lowered a lighted candle down the well, the danger of a further fall of the sides deterring themselves from going down. The candle went down one hundred feet, thus showing that about twenty feet of the mass, or a considerable portion thereof, lay above the unfortunate Billard. In reply to their call, he was heard distinctly to say that he could not see any thing of the light. "I am assured," he moreover said, "that I am a lost man. But I suffer no pain, and I breathe freely."

No ordinary difficulty, it was obvious, stood in the way of relief in this case. For workmen to descend into the narrow deep well, and attempt to clear away the ruins, without some security against a further fall of the sides, was a dangerous task. The authorities of the district, as soon as they arrived, and saw the nature of the accident, sent off an express for the district superintendent of roads and bridges, Monsieur Certain. He was at some distance, and did not arrive till next day. In the mean time, one man, a slater, ventured to descend to the top of the fallen mass of stones and earth, which proved, as had been shown by the candle, to be about one hundred feet below the orifice. Urged by the indistinct cries for help which they heard from poor Billard, the men on the spot began to lift the stones forming the sides of the well. When Monsieur Certain arrived, he descended without hesitation into the well, and put several questions to Billard respecting his situation. M. Certain judged it proper to continue the raising of the sides of the well, as the displacement of the lower part would render it most imprudent to go on otherwise. No side boring could be executed with such speed as the whole well could be cleared. The soil, fortunately, was clayey and firm. While this labour was going on day and night, with the utmost rapidity compatible with a proper degree of caution, friends and fellow workmen of Billard descended occasionally to animate him with the cheering sound of kindly voices, and with the assurance that help was near.

On the morning of the 29th, the governor and head engineer of the department of the Indre arrived. M. Ferrand, inspector of works, was with them, and descended into the well. He gave his assent to the continuation of the operations going on, which some of the anxious friends of the prisoner were beginning to exclaim against, from their seeming slowness. In presence of the gentlemen mentioned, the labours were continued, and on the evening of the 29th the well was clear to the upper part of the fallen mass. Without delay, the process of lifting them was begun; but from the size of the stones, the work went on very tardily, through the difficulty of hoisting them to such a distance above. After they had advanced a certain way, a new difficulty met them in the face. It was impossible to tell the exact state of the arch formed so miraculously over the head of the unfortunate man, or its degree of stability. It was necessary, therefore, to go on with the elevation of the stones with extreme care and delicacy, otherwise the unsettlement of any portion of the heavy masses above him might have caused his instantaneous death, either from a crush or suffocation.

At ten o'clock in the evening of the 29th, the workmen were calculated to be about six feet above the captive, who had now been shut out from the light since the morning of the 27th. It was impossible to send him food by a bore as in the case of Dufavel, and he had therefore the pressure of hunger added to his misery. His voice was heard more clearly as the workmen went on, and they could now even tell the exact point where he was confined. But during the night of the 29th his voice became a source of fear and alarm to the labourers above him. Billard's motionless condition, his want of food and air for so long a time, began to overthrow his moral courage. His reason gave place to delirium, his hope to despair. The

workmen heard him at one moment lamenting his fate and piteously crying for food, and at the next moment they heard him abandoning himself to the most extravagant gaiety. Laughter heard in such a situation was a thing almost too deplorable and shocking for human ears to listen to. When consulted on the meaning of these symptoms on the part of Billard, M. Nabert, a surgeon who had never quitted the spot since the time of the accident, recommended the workmen to hurry on their labours, as the man could probably survive but a few hours in this state.

In consequence of this advice, a new direction was given to the work, and in place of passing down by the side of the spot where the poor man was supposed to be, the excavation was carried slopingly down to his head. In fine, after three days and three nights of incessant toil, the head of Billard was reached, and cleared of all surrounding matter. The instant that this took place, it was notified to those above by a cry, and the deafening shouts that were immediately raised, showed what an assemblage had gathered around the place to learn the issue of the case. The deliverance took place exactly a quarter of an hour before eleven o'clock in the morning of the 30th. When raised once more to the daylight, every precaution was taken to prevent any bad effects from a change so sudden. He was carried to a neighbouring house, with his body and head well wrapped up, and there he was laid in an apartment, from which the light was in a great measure excluded. After some spoonfuls of light broth and a little wine had been administered to him, he fell immediately asleep, never having tasted that blessing during his confinement. Before sleeping, he had spoken in such a way as to show that his mind had recovered its tone. His pulse was weak but quick, beating 126 times in a minute; his skin was cold, his thirst burning, and his tongue stuck almost to the roof of his mouth. While confined, he had eaten a portion of the leather front of his cap or bonnet, and he had even, he said, endeavoured to grind with his teeth a stone that lay before his mouth.

Etienne Billard soon recovered. His imprisonment had not been so protracted as to render the vital heat difficult of restoration. His body, however, though not mangled or bruised, as it might have been expected to be, retained for a long time a feeling of dull pain, from the pressure that had been exerted upon it.

ENGLISHMAN ASCENDING VESUVIUS.

THE Countess of Blessington, in her recent work, "The Idler in Italy," remarks that the travelling English make the worst appearance abroad of all nations, on account of the large portion of uneducated men whom wealth allows, amongst us, to quit their country for a season. The traces of this in continental albums are, she says, very conspicuous. The following is a grotesque picture presented by her ladyship of a fellow-countryman whom she found toiling up the slopes of Vesuvius. Supposing it to be an account of a real person actually seen, it supplies an apt illustration of the philosophy of a late article entitled, "Business and Leisure."

"A most piteous sight was presented to us by the ascent of a very fat elderly Englishman, who commenced this painful operation at the same time that we did. He was, like me, preceded by a guide with leathern straps, to which he adhered with such vigorous tenacity, as frequently to pull down the unfortunate man, who complained loudly. The lava, gravel, and cinders, put in motion by the feet of his conductor, rolling on those of the fat gentleman, extorted from him sundry reproaches, to which, however, the Italian was wholly insensible, not understanding a word of English. The rubicund face of our countryman was now become of so dark a crimson, as to convey the idea of no slight danger from an attack of apoplexy; and it was bathed in a profuse perspiration, which fell in large drops on his protuberant stomach. Being afraid to let go the leathern straps for even an instant, he was in a pitiable dilemma how to get at his pocket handkerchief. One of our party offered to take out his pocket handkerchief, seeing how much he stood in need of it; an offer which he thankfully accepted, but explained that his pocket was secured by buckles on the inside, to prevent his being robbed; a precaution, he added, that he well knew the necessity of, as those Lazaretos (*Lazaroni* he meant) would not otherwise leave a single article in it. It required no little portion of ingenuity to separate the pocket inside; and while the operation was performing, he kept praying that his purse, snuff-box, or silver flask, might not be displayed, lest they might tempt the Lazaretos to make away with him, in order to obtain those valuables.

"I took care to conceal my watch," said he with a significant look, "for I know these rascals of Lazaretos right well. Why, would you believe it, ladies and gentlemen? they pretty nearly knocked me down in that dirty village where the donkeys are hired. I was up to their tricks, however, and saw, with half an eye, that when they pretended to fight among themselves, it was a mere sham, as an excuse that I might get an unlucky blow between them, when, I warrant me, they would soon have dispatched me, and have divided my property amongst them, but they saw your large party coming, and that saved me."

I asked why, if his opinion of the Neapolitans was so bad, he ventured alone with them on so hazardous an expedition. "Indeed, ma'am, I never had such a foolish intention; for, would you believe it, I have come to that dirty village no less than three times, in the hope of meeting a large party of English who might serve as a protection for me, but until to-day never saw more than one or two persons, therefore I returned as I came. I had heard, however, so much of this burning mountain,

that I was determined to look on with my own eyes; for I am one of those who don't believe every thing I hear, I can tell you, and more especially about places in foreign parts. In truth, ma'am, I just wanted to be able to say when I got home, 'Why, good people, I've been on the spot, and am up to the whole thing.'"

NATURE.

[BY R. C. WATERSTON.]

I love thee, Nature—love thee well—
In sunny nook and twilight dell,
Where birds and bees and blossoms dwell,
And leaves and flowers;
And winds in low sweet voices tell
Of happy hours.

I love thy clear and running streams,
Which mildly flash with silver gleams,
Or darkly lie, like shadow dreams,
To bless the sight;
While every wave with beauty teems,
And smiles delight.

I love thy forest, deep and lone,
Where twilight shades are ever thrown,
And murmuring winds, with solemn tone,
Go slowly by,
Sending a peal like ocean moan,
Along the sky.

I love to watch at close of day,
The heavens in splendour melt away,
From radiant gold to silver grey,
As sinks the sun;
While stars upon their trackless way,
Come one by one.

I love, I know not which the best,
The little wood-bird in its nest,
The wave that mirrors in its breast
The landscape true,
Or the sweet flower by winds carressed,
And bathed in dew.

They all are to my bosom dear,
They all God's messengers appear!
Preludes to songs that spirits hear!
Mute prophecies!
Faint types of a resplendent sphere
Beyond the skies!

The clouds—the mist—the sunny air—
All that is beautiful and fair,
Beneath, around, and everywhere,
Were sent in love,
And some eternal truth declare
From heaven above!

—New York Mirror.

MISERIES OF AMERICAN NEWSPAPER PROPRIETORS.

[The serio-comic complaints of editors and publishers of newspapers, that their subscribers fail to pay for their papers, seem to form a standard topic among our transatlantic brethren of the press. The following are two specimens of this kind of lachrymose drollery.]

A SINGULAR ADVENTURE.

Once upon a time a traveller stepped into a post-coach. He was a young man, just starting in life. He found six passengers about him, all of them grey-headed, and extremely aged men. The youngest appeared to have seen at least eighty winters. Our young traveller was struck with the singularly mild and happy aspect which distinguished his fellow-passengers, and determined to ascertain the secret of long life, and the art of making old age comfortable. He first addressed the one who was apparently the oldest, who said that he had always led a regular and abstemious life, eating vegetables and drinking water. The young man was rather daunted at this, inasmuch as he liked the good things of this life. He addressed the second, who astonished him by saying he had eaten roast beef and gone to bed regularly drunk for seventy years—adding, that all depended on regularity. The third had prolonged his days by never seeking or accepting office; the fourth by resolutely abstaining from political or religious controversies; and the fifth by going to bed at sunset and rising at dawn. The sixth was apparently much younger than the other five; his hair was less grey, and there was more of it—a placid smile, denoting a perfectly upright conscience, mantled his face, and his voice was jocund and strong. They were all surprised to learn that he was by ten years the oldest man in the coach. "How!" exclaimed our young traveller, "how is it you have thus preserved the freshness of life?—where there is one wrinkle on your brow, there are fifteen on that of each of your juniors—tell me, I pray, your secret of long life?" "It is no mystery," said the old man; "I have drunk water and wine; I have eaten meat, and have eaten vegetables; I have held a public office; I have dabbled in politics, and have written religious pamphlets; I have sometimes gone to bed at sunset, and sometimes at midnight; got up at sunrise, and at noon; but—I always paid promptly for my newspapers."

DELINQUENT SUBSCRIBERS.

The Mobile Mercantile Advertiser has changed proprietors. Mr Smith, the former conductor of the journal, thus concludes his farewell remarks to his readers. There is more truth than poetry in what he says. Hear him, and let those to whom his remarks apply consider their conduct. We have a few such patrons as those of Mr Smith among the readers of the *Mirror*—we are sorry to say—but we hope their number will decrease every week. They are the incubuses that paralyse exertion and depress the literature of the land. But to the extract—

"Of all trades, professions, or callings, I know of none—I have followed a great many—so poorly paid as publishers of newspapers. Many patrons of newspapers, otherwise worthy, punctual men, think it not unrighteous to let the publisher wait year after year for his dues—

and at last, if he is compelled to pay, he does it with a very bad grace. Mr Type must have his money, must he? Well, if he must, he must. Give me a receipt; and, do you hear, stop the paper! I have patronised that establishment six years—there is no such thing as gratitude in the world. Another will tell you he never subscribed for the paper; 'the boy has left it every morning, it is true, and as it was left, I did read it occasionally—but I never ordered it.' There is another class of patrons, who never subscribe at all, but are great friends of the paper, and always read it—in fact, this is the class who may be termed 'your constant readers.' 'Here, Sam, go over the way, with my compliments to Mr Tompkins, and ask him for the loan of his paper; and, Sam, tell him, as he never reads it before breakfast, I'll thank him to let John bring it over here every morning—it is an excellent paper—that editor really knows what he is about—I begin to think of patronising him myself.' There yet remains to be mentioned one more class of patrons—supporters, I should say—for they are the support and stay of publishers. This class is composed of those who say, 'Here, Mr Clerk, be so good as to place my name on your subscription list, and write opposite to it PAID IN ADVANCE.' In looking over a list of some thousands yesterday, I saw a hundred or two of this class. If I had any golden types, their names should literally appear in letters of gold. There are now from twelve to fifteen thousand dollars due this office; and I am convinced the new proprietors would willingly sell all the debts for five thousand! It is thus with all newspapers—and why? because publishers are good-natured, and submit to their own degradation in the scale of tradesmen. Let this state of things be amended—reform it altogether. Adhere strictly to the terms of your papers—for, take the word of an experienced man, you had better keep your ink and paper than furnish them and your labour for nothing. You may get popularity, but you will get no pork and cabbage for your dinner."

Delinquent subscriber—if you be an honest man, send us the amount you owe us.—Ed. N. Y. M.R.

REMOVAL.

I have such horror of moving, that I would not take a benefice from the king, if I were not indulged with non-residence. What a dislocation of comfort is comprised in that word—moving! Such a heap of little nasty things, after you think all is got into the cart; old dredging boxes, worn-out brushes, gallipots, vials, things that it is impossible the most necessitous person can ever want, but which the women, who preside on these occasions, will not leave behind if it were to save your life; they'd keep the cart ten minutes to stow in dirty pipes and broken matches, to show their economy. Then you can find nothing you want for many days after you get into your new lodgings. You must comb your hair with your fingers, wash your hands without soap—go about in dirty gaiters. Were I Diogenes, I would not move out of a kilderkin into a hogsheld, though the first had nothing but small beer in it, and the second reeked claret.—Lamb.

CAPACITY FOR HAPPINESS.

Happiness consists in the multiplicity of agreeable consciousness. A peasant has not a capacity for having equal happiness with a philosopher: they may be equally satisfied, but not equally happy. A small drinking-glass and a large one may be equally full, but the larger one holds more than the small one.—Johnson.

ATTACK UPON A LION.

Passing the following morning, Richardson and myself were suddenly made aware of the monster's presence by perceiving a pair of gooseberry eyes glaring upon us from beneath a shady bush; and instantly, upon reining up our horses, the grim savage bolted out with a roar like thunder, and bounded across the plain with the agility of a greyhound. The luxuriant beauty of his shaggy black mane, which almost swept the ground, tempted us, contrary to established rule, to give him battle, with the design of obtaining possession of his spoils; and he no sooner found himself hotly pursued, than he faced about, and stood at bay in a mimosa grove, measuring the strength of his assailants with a port the most noble and imposing. Disliking our appearance, however, and not relishing the smell of gunpowder, he soon abandoned the grove, and took up his position on the summit of an adjacent stony hill, the base of which being thickly clothed with thorn trees, we could only obtain a view of him from the distance of three hundred yards. Crouched on this fortified pinnacle, like the sculptured figure at the entrance of a nobleman's park, the enemy disdainfully surveyed us for several minutes, daring us to approach with an air of conscious power and pride, which well becometh his grizzled form. As the rifle-balls struck the ground nearer and nearer at each discharge, his wrath, as indicated by his glistering eyes, increased roar, and impatient switching of the tail, was clearly getting the mastery over his prudence. Presently a shot broke his leg. Down he came upon the other three, with reckless impetuosity, his tail straight out and whirling on its axis, his mane bristling on end, and his eyeballs flashing rage and vengeance. Unable, however, to overtake our horses, he shortly retreated under a heavy fir, limping and discomfited, to his stronghold. Again we bombarded him, and, again exasperated, he rushed into the plain with headlong fury, the blood now streaming from his open jaws, and dyeing his mane with crimson. It was a gallant charge, but it was to be his last. A well-directed shot arresting him in full career, he pitched with violence upon his skull, and throwing a complete somersault, subsided amid a cloud of dust.—Harris.

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all book-sellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

STORIES OF THE IRISH PEASANTRY.

BY MRS S. C. HALL.

"Mind not high things: but condescend to men of low estate."
ST PAUL.

"DO YOU THINK I'D INFORM?"

JAMES HARRAGAN was as fine a specimen of an Irishman as could be met with in our own dear country, where the "human form divine," if not famous for very delicate, is at least celebrated for very strong proportions: he was, moreover, a well-educated, intelligent person; that is to say, he could read and write, keep correct accounts of his buying and selling, and managed his farm, consisting of ten good acres of the best land in a part of Ireland where all is good (the Barony of Forth), so as to secure the approbation of an excellent landlord, and his own prosperity. It was a pleasant sight to see the honest farmer bring out the well-fed horse and the neatly appointed car, every Saturday morning, whereon his pretty daughter Sydney journeyed into Wexford, to dispose of the eggs, butter, and poultry, the sale of which aided her father's exertions.

Sydney was rather an unusual name for a young Irish girl; but her mother had been housekeeper to a noble lady, who selected it for her, though it assimilated strangely with Harragan. The maiden herself was lithe, cheerful, industrious, and of a gentle loving nature; her brown affectionate eyes betokened, as brown eyes always do, more of feeling than of intellect; and her red lips, white teeth, and rich dark hair, entitled her to the claim of rustic beauty. Her mother had been dead about two years, and Sydney, who during her lifetime was somewhat inclined to be vain and thoughtless, had, as her father expressed it, "taken altogether a turn for good," and discharged her duties admirably as mistress of James Harragan's household. She had five brothers, all younger than herself; the two elder were able and willing to assist in the farm, the juniors went regularly to school.

Sorrow for the loss of his wife had both softened and humbled James Harragan's spirit; and when Sydney, disdainful any assistance, sprang lightly into the car, and seated herself in the midst of her rural treasures, her father's customary prayer, "Good luck to you, Sydney, my darling," was increased by the prayer of "May the Lord bless you, and keep you to me, now, and till the day of my death!"

The car went on, Sydney laughing and nodding to her father, while he smiled and returned her salutation, though, when she was fairly out of sight, he passed the back of his rough hand across his eyes, and muttered, "I almost wish she was not so like her mother!" When James entered his cottage, he sat by the fire, and, taking down a slate that hung above the settle, began to make thereupon sundry calculations, which I do not profess to understand; how long he might have continued so occupied, I cannot determine, for his cogitations were interrupted by the entrance of a gentleman, who was by his side ere he noticed his approach. The usual salutations were exchanged; the best chair dusted, and presented to the stranger; every thing in the house was tendered for his acceptance. "His honour had a long walk, would he have an egg or a rasher for a snack; Sydney was out, but Bessy her cousin was above in the loft, and would get it or any thing else in a minute; or maybe he'd have a glass of ale—good it was—Cherry's ale—no better in the kingdom." All Irishmen—and particularly so fine and manly a fellow as James—to be seen to advantage, should be seen in their own houses—CABINS I cannot call such as are tenanted by the warm farmers of this well-cultivated district.

Mr Herrick, however, could not be tempted; he would not suffer the rasher to be cut, nor the ale to be drawn, and James looked sad because his visitor declined accepting his humble but cheerful hospitality.

"James," said Mr Herrick, "I am glad I found you at home and alone, for I wanted to speak with you. I have long considered you superior to your neighbours.

I do not mean as a farmer—though you have twice received the highest prizes which the Agricultural Society bestow—but as a man."

James looked gratified, and said he was so.

"I have found you, James, the first to see improvement, and to adopt it, however much popular prejudice might be against it. You have been ever ready to listen to and act upon the advice of those whom your reason told you were qualified to give it; and you have not been irritated or annoyed when faults, national or individual, have been pointed out to you which can be and ought to be remedied."

"I believe what your honour says is true; but sure it's proud and happy we ought to be to have the truth told of us—it is what does not always happen; if it did, poor Ireland would have had more justice done her long ago than ever came to her share yet."

"And that, James, is also true," said Mr Herrick; "the Irish character has not only its individual differences, which always must be the case, but it has its provincial, its baronial distinctions."

"Indeed, sir," replied Harragan, "there can be no doubt about that; we should be sorry, civilised as we are here, to be compared to the wild rangers of Connaught, or to the stayed, quiet, tradesman-like people of the north."

"The northers are a fine prudent people," said Mr Herrick, "notwithstanding your prejudice; but what you have said is only another proof that persons may write very correctly about the north of Ireland, and yet, unless they see the south, form a very limited, or, it may be, erroneous idea of the character of the south-erns. The Irish are more difficult to understand than people imagine. You are a very unmanageable people, James," added the gentleman, good humouredly.

"Bedad, sir, I suppose you're right; some of us are, I dare say. And now, sir, I suppose there is a reason for that."

"There is," answered his friend. "You are an unmanageable people, because of your prejudices."

"That's your old story against us, Mr Herrick," said James; "and yet you can't deny but I've been often led by your honour, and for my good, I'll own to that."

"James," continued his friend, "will you answer me one question? Were you, or were you not, at Gerald Casey's on Monday week?"

James's countenance fell, it positively elongated, at the question. So great was the change, that those who did not know the man might have imagined he had committed a crime, and anticipated immediate punishment. "At Gerald Casey's?" he repeated.

Mr Herrick drew a letter—a soiled, dirty-looking letter—from his pocket, and slowly repeated the question.

"I was, sir," he answered, resting his back against the dresser, and pressing his open palms upon the board, as if the action gave him strength.

"Who was there, James?"

"Is it who was in it, sir? Why, there was—Bedad, sir, there was—Oh, then, it's the bad head I have at remembering—I forget who was there." And the countenance of James assumed, despite his exertions, a lying expression that was totally unworthy his honest nature.

"James," observed Mr Herrick, "you used not to have a bad memory. I have heard you speak of many trifling acts of kindness my father showed you when you were a boy of twelve years old."

The farmer's face was in a moment suffused with crimson, and he interrupted him with the grateful warmth of an affectionate Irish heart. "Oh, sir, sure you don't think I'm worse than the poor dog that follows night and day at my foot? You don't think I've no heart in my body?"

"I was talking of your memory," said Mr Herrick, quietly; "and I ask you again to tell me who were at Gerald Casey's on Monday week?"

"I left Gerald Casey's before dusk, sir; and it's what took me in it was—"

"I don't ask you when you left it, or what took you there. I only ask you who were present?"

James saw there was no use in equivocating, for that Mr Herrick would be answered. He was, as I have said, an excellent fellow; yet he had, in common with his countrymen, a very provoking way of evading a question; but, anxious as he was to evade this, he could not manage it. Mr Herrick looked him so steadfastly in the face, that he slowly answered, "I'd rather not say one way or other who was there or who was not there. I've an idea, from something I heard this morning, before the little girl went into Wexford, that I know now what your honour's driving at. And sure," and his face deepened in colour as he continued—"and sure, Mr Herrick, 'do you think I'd inform?'"

Mr Herrick was not astonished at the answer he received. On the contrary, he was quite prepared for it, and prepared also to combat a principle that militates so strongly against the comfort and security of those who reside in Ireland.

"Will you," he inquired, "tell me what you mean by the word 'inform?'"

"It's a mean dirty practice, sir," replied Harragan, "to be repeating every word one hears in a neighbour's house."

"So it is," answered the gentleman; "an evil, mean practice, to repeat what is said merely from a love of gossip. But suppose a person, being accidentally one of a party, heard a plot formed against your character, perhaps your life, and not only concealed the circumstance, but absolutely refused to give any clue by which such a conspiracy could be detected—"

"Oh, sir," interrupted Harragan, "that's nothing here nor there. I couldn't tell in the grey of the evening who went in or out of the place; I had no call to any one, and I don't want any one to have any call to me."

"You must know perfectly well who was there," said Mr Herrick. "The case is simply this: a gentleman in this neighbourhood has received two anonymous letters, attacking the character of a person who has been confidentially employed by him for some years. James Harragan, you know who wrote those letters; and I ask you, how, as an honest man, you can lay your head upon your pillow and sleep, knowing that an equally honest man may be deprived of the means to support his young family, and be turned adrift upon the world through the positive malice of those who are envious of his prosperity and good name."

James looked very uncomfortable, but did not trust himself to speak.

"I repeat, you know by whom these letters are written."

"As I hope to be saved!" exclaimed James, "I saw no writing—not the scratch of a pen!"

"Harragan," continued Mr Herrick, "it would be well for our country if many of its inhabitants were not so quick at invention."

"I have not told a lie, sir."

"No, but you have done worse—you have equivocated. Though you did not see the letter written, you knew it was written; and an equivocation is so cowardly, that I wonder an Irishman would resort to it; a lie is in itself cowardly, but an equivocation is more cowardly still."

Harragan for a moment looked shillalals and crab-thorns at his friend, for such he had frequently proved himself to be, but made no further observation, simply confining himself to the change and repetition of the sentences—"Do you think I'd inform?" "Not one belonging to me ever turned informer."

"Am I then," said Mr Herrick, rising, "to go away with the conviction, that you know an injury has been done to an innocent person, and yet will not do any thing to convict a man guilty of a moral assassination?"

"A what, sir?"

"A moral murder."

"Look here, sir; one can't fly in the face of the country. If I was to tell, my life would not be safe either in or out of my own house; you ought to know this. Besides, there is something very mean in an informer."

"It is very sad," replied Mr Herrick, "that a spirit of combination for evil more than for good destroys the confidence which otherwise the gentry and strangers would be disposed to place in the peasantry of Ireland. As long as a man fears to speak and act like a man, so long as he dare not hear the proud and happy sound of his own voice in condemnation of the wicked, and in praise of the upright—so long, in fact, as an Irishman dare not speak what he knows—so long, and no longer, will Ireland be insecure, and its people scorned as cowards!"

"As cowards!" repeated James indignantly.

"Ay," said Mr Herrick; "there is a moral as well as a physical courage. The man who, in the heat of battle, faces a cannon ball, or who, in the hurry and excitement of a fair or pattern, exposes his bare head to the rattle of shillaloes and clan-alpines without shrinking from punishment or death, is much inferior to the man who has the superior moral bravery to act in accordance with the dictates of his own conscience, and does right while those around him do wrong."

"I dare say that's all very true, sir," said James, scratching his head; adding, while most anxious to change the subject, "It's a pity yer honour wasn't a councillor or a magistrate, a priest, minister, or friar itself, then you'd have great sway entirely with your words and your learning."

"Not more than I have at present. Do you think it is a wicked thing to take away the character of an honest man?"

"To be sure I do, sir."

"And yet you become a party to the act."

"How so, sir?"

"By refusing to bring, or assist in bringing, to justice those who have endeavoured to ruin the father of a large family. Do you believe so many murders and burnings would take place if the truth was spoken?"

"No, sir."

"That's a direct answer from an Irishman for once. If the evil-disposed, the disturbers of the country, knew that truth would be spoken, disturbances would soon cease; you believe this, and yet, by your silence, you shield those whom you *know* to be bad, and despise with all your heart and soul."

"I don't want to have any call to them one way or other, good, bad, or indifferent," answered James.

"Very well," said Mr Herrick, thoroughly provoked at the man's obstinacy, and rising to leave the cottage; "you say you wish to have no call to them. But mark me, James Harragan: when the spirit of anonymous letter-writing gets into a neighbourhood—when wicked-minded persons can destroy either a man's reputation or his life with equal security, there is no knowing where the evil may stop, or who shall escape its influence. The knowledge of the extent to which these secret conspiracies are carried, deters capitalists from settling amongst us; they may have security for their money, but they have none for their lives; if they offend by taking land, or offering opposition to received opinions, their doom may be fixed; those whom they have trusted will know of that doom, and yet no one will come forward to save them from destruction."

"Sir," said Harragan, "secret information is sometimes given."

"I would accept no man's secret information," answered Mr Herrick, for he was an upright man, perhaps too uncompromising for the persons with whom he had to deal; "justice should not only be even-handed, but open-handed; it is a reproach to a country when the law finds it necessary to offer rewards for secret information. I wish I could convince you, James, of the difference which exists between a person who devotes his time to peeping and prying for the purpose of conveying information to serve himself, and him who speaks the truth, from the upright and honourable motive of seeing justice done to his fellow-creatures."

"I see the differ clear enough, sir," replied the farmer; "but none of my people ever turned informers. I'll have no call to it, and it's no use saying any more about the matter; there are plenty of people in the country can tell who was there as well as I—I'll have no call to it. When I went in the place, I little thought of who I'd meet there, and I'll go bail it's long before I'll trouble it again. There's enough said and done now."

"A good deal said, certainly," rejoined Mr Herrick, "but nothing done. There are parts of the country where I know that my entering into this investigation would endanger my life, but, thank God, that is not the case here. I will pursue my investigation to the uttermost, and do not despair of discovering the delinquent."

"I hope you may with all my heart and soul, sir," replied the farmer.

"Then why not aid me? If you are sincere, why not assist?"

And again James Harragan muttered, "Do you think I'd inform?"

"I declare, before heaven!" exclaimed Mr Herrick, "you are the most provoking people under the sun to deal with."

"I ask your honour's pardon," said James, slyly; "but you have not lived long enough in foreign parts to know that."

"Your readiness will not drive me from my purpose."

I repeat you are the most provoking people in the world to deal with. Convince an Englishman or a Scotchman, and having convinced his reason, you may be certain he will act upon that conviction; but you, however convinced your reason may be, continue to act from the dictates of your prejudice. Remember this, however, James Harragan: you have refused to pluck out the arrow which an unseen hand has planted in the bosom of an excellent and industrious man—take care that the same invisible power does not aim a shaft against yourself!"

Mr Herrick quitted the cottage more in sorrow than in anger; and after he was gone, James Harragan thought over what he had said; he was quite ready to confess its truth, but prejudice still maintained its ascendancy. "Aim a shaft against myself," he repeated; "I don't think any of them would do that, though I'm sorry to say many as good and better than I, have been forced to fly the country through secret malice; it is a bad thing, but times 'ill mend, I hope."

Alas! James Harragan is not the only man in my beloved country who satisfies himself with hoping that times will mend, without endeavouring to mend them. "Aim a shaft against myself," he again repeated. "Well, I'm sure what Mr Herrick said is true; but, for all that, I couldn't inform!"

The fact was, that, reason as he would, James could not get rid of his prejudice; he could not make the distinction between the man who turns the faults and vices of his fellow-creatures to his own account, and he who, for the good of others, simply and unselfishly speaks the truth.

Time passed on: Mr Herrick, of course, failed in his efforts to discover the author of the anonymous letter; the person against whom it was directed, although protected by his landlord, was ultimately obliged to relinquish his employment, and seek in other lands the peace and security he could not find in his own; he might, to be sure, have weathered the storm, for his enemies, as will be seen by the following anecdote, had no immediate intention of persecuting him to the death. A stranger, who bore a great resemblance to the person so obnoxious to those who met at the smith's forge, was attacked while travelling on an outside car in the evening, and in the immediate neighbourhood, and beaten most severely before his assailants discovered they had ill used the wrong man! Nothing could exceed their regret when they discovered their mistake.

"Ah, thin, who are ye at all at all?" inquired one fellow, after having made him stand up, that they might again knock him down more to their satisfaction; "sure ye're not within a foot as tall as the boy we're after. Is it crooked in the back ye are on purpose? Well, now, think o' that!—what call had ye to be on Barney Brian's car, that so often carries him, and with the same surtoe? and why didn't ye say ye wasn't another? Well, it's heart sorry we are for the mistake, and hope it'll never happen to ye again, to be like another man, and he an out-lawyer, as a body may say, having received enough notice to quit long ago, if he'd only heeded it, which we'll make him do, or have his life, after we admonish him onst more, as we've done you by mistake, with a taste of a-bating, which we'd ask ye to tell him, if you know him; there, we'll lay you on the car, as aisy as if you war in yer mother's lap, and ask ye to forgive us, which we hope you'll do, as it was all a mistake! and no help for it!"

The victim of "the mistake," however, who was an Englishman, suffered for more than three months, and cannot comprehend to this day why those who attacked him so furiously were not sought out and brought to justice. He never could understand why an honest man should refuse to criminate a villain. The poor fellow for whom the beating was intended was not slow to discover the fact, and, with a heavy heartache, bade adieu to his native land, which, but for the sake of his young children, he would hardly have quitted even to preserve his own life.

James Harragan did not note those occurrences without much sorrow; he saw his daughter Sydney's eyes red for three entire days from weeping the departure of the exile's wife, whom she loved with the affection of a sister; and he had the mortification to see his beloved barony distinguished in the papers as a "disturbed district" from the mistake to which we have alluded, at the very time when many of the gentry were sleeping with their doors unfastened. James Harragan knew perfectly well that if he had spoken the truth, all this could have been prevented. Still time passed on. Mr Herrick seldom visited James; and though he admired his crops, and spoke kindly to his children, the farmer felt he had lost a large portion of the esteem he so highly valued.

But when a man goes on in the full tide of worldly prosperity, he does not continue long in trouble upon minor matters. Sydney's eyes were no longer red; nay, they were more sparkling than ever, for they were brightened by a passion to which she had been hitherto a stranger. And Sydney, though gifted with as much constancy as most people, if she did not forget, certainly did not think as frequently as before of her absent friend. Sydney, in fact, was what is called—in love; which, I believe, is acknowledged by all who have been in a similar dilemma, to be a very confusing, perplexing situation. That poor Sydney found it so, was evident, for she became subject to certain flushings of the cheek and beatings of the heart, accompanied by a confusion of the intellectual faculties, which puzzled her father for a time quite as much as herself. She would call rabbits chickens, and chickens rabbits, in the public market, and was known to have given forty-two new laid eggs for a shilling, when she ought only to have given thirty-six.

Then in her garden, her own pet garden, she sowed mignonette and hollyhocks together, and wondered how it was that what she fancied sweet pea, had come up "love lies bleeding." Dear, warm, affectionate Sydney Harragan! She was a model of all that is excellent in simple guileless woman; and when Ralph Furlong drew from her a frank but most modest confession that his love

was returned, and that "if her father did not put again it," she would gladly share his cottage and his fortunes, there was not a young disengaged farmer in the county that would not have envied him his "good luck."

Soon after James Harragan's consent had been obtained to a union which he believed would secure the happiness of his darling child, the farmer was returning from the fair of New Ross, where he had been to dispose of some spare farming-stock; and as he trotted briskly homeward, passing the well-known mountain, or, as it is called, "Rock" of Carrickburn, he was overtaken by a man, to whom he had seldom spoken since the evening when he had seen him and some others at Gerald Casey's forge. Many months had elapsed since then. And, truth to say, as the young man had removed to a cottage somewhere on the banks of the blue and gentle river Slaney, James had often hoped that he might never see him again.

"I'm glad I overtook you, Mr Harragan," he said, urging his long lean narrow mare, close to the stout well-fed cob of the comfortable farmer. "It's a fine bright evening for the time of year. I intended coming to you next week, having something particular to talk about."

"Nothing that concerns me, I fancy," replied Harragan, stiffly.

"I hope it does, and that it will; times are changed since we met last—with me particularly," Harragan made no reply, and they rode on together in silence for some time longer.

"Mr Harragan, though you are a trustworthy man as ever steept in shoe leather, I am afraid you haven't a good opinion of me."

"Whatever opinion I may have, you know I kept it to myself," replied the farmer.

"Thank you for nothing," was the characteristic reply.

"Ye're welcome," rejoined James, as drily. Again they trotted silently on their way, until the stranger suddenly exclaimed, reining up his mare at the same moment, "I'll tell you what my business would be with you; there's nothing like speaking out of the face at onst."

"You did not always think so," said the farmer.

"Oh, sir, aisy now; let bygones be bygones; the country's none the worse of getting rid of one who was ever and always minding other people's business; and you yourself, Mr Harragan, are none the worse for not having high-bred people ever poking their noses in yer place!"

"Say what you have to say at onst," observed James; "the evening will soon close in, and the little girl I have at home thinks it long till I return."

"It's about her I want to spake," said the stranger.

"If you'll take the trouble some fine morning early to ride over to where the dark green woods of Castle Boro dip their boughs in the Slaney, ye'd see that I have as tidy a place, as well filled a haggard, and as well managed fields, as any holder of ten acres of land in the county; besides that, I have my eye on another farm that's out of lease, and if all goes right I'll have it. Now, ye see my sister's married, and my mother's dead, and I've no one to look after things; and for every pound ye'd tell down with yer daughter, I'd show a pound's worth. And so, Mr Harragan, I thought that of all the girls in the country, I'd prefer Sydney; and if we kept company for a while"—he turned his handsome but sinister and impudent countenance towards the astonished farmer, adding—"I don't think she'd refuse me."

"You might be mistaken for all that," replied James, grasping his stout stick still more tightly in his hand, from a very evident desire to knock the fellow down.

"Well, now, I don't think I should," he replied, with vulgar confidence; "it's the aisiest thing in life to manage a purty girl, if one has the knack, and I've managed so many."

"Ride on!" interrupted the farmer indignantly. "Ride on, before I am tempted to knock ye off the poor starved beast that ye haven't the heart to feed! You marry my Sydney—*you!*—a rascal like *you!* Why, Stephen Murphy, you must be gone mad—Sydney married with a cowardly backbiter! I'd rather dress her shroud with my own hands. A—ride on, I tell you," he continued, almost choked with passion; "there is nothing, I believe, that you would think too bad to do. And, hark ye, take it for your comfort that she is going to be married to one worthy of her, and I her father say so."

"Oh, very well! very well!" said the bravo; "as you please, Mr Harragan, as you please; I meant to pay yer family a compliment—a compliment for yer silence, ye understand me; not that I would myself over and above obligeed for that either. Ye like to take care of yerself, for the sake of yer little girl, I suppose; and the country might grow too hot for you, as well as for others, if ye made free with yer tongue. No harm done; but if I had spaking with the girl for one hour, I'd put any sweetheart in the county, barring myself, out of her head. I'll find out the happy young man, and wish him joy. Oh, maybe I wout wish joy to the boy for whom I'm insulted," he added, inflicting a blow upon the bare ribs of the poor animal he rode, that made her start; "maybe I wout wish him joy, and give him Steve Murphy's blessing. Starved as ye call my baste, there's twice the blood in her that creeps through the flesh of yer overfed cob;" and, sticking the long solitary iron spur which he wore on his right heel into the mare, he flew past James Harragan, flourishing his stick with a whirl, and shouting so loud, that the mountain echoes of the wild rocks of Carrickburn repeated the words "joy! joy!" as if they had been thrown into their caverns by the fend of mockery himself.

Instantly James urged his stout horse forward, crying at the top of his voice to Murphy to stop; but either the animal was tired, or the mare was endowed with supernatural swiftness, for he soon lost sight even of the skirts of Murphy's coat, which floated loosely behind him. "The scoundrel!" he muttered to himself, while the gallop of his steed subsided into a heavy but tolerably rapid trot; "I wanted to tell him to take care how he meddled with me or mine. Sydney! Sydney indeed! And the rascal's assurance!—he never spoke three words to my girl in his life! It's a good thing we're rid of him here

any way. I hope he's not a near neighbour of any of Furlong's people, that's all; his impudence—to me who knew him so well! *Save me right,*" he thought within himself, when his mutterings had subsided; "save me right, to keep the secret of such a fellow. I suffered those who war innocent to leave the country—and he to talk of paying my family a compliment! Mr Herrick said it would come home to me, and so it has. I'm sure Murphy must have been overtaken,* or he'd never dare to propose such a thing. But, then, if he was, why, the devil takes the weight off a tipsy man's tongue, and then all's out."

It was night before Harragan arrived at his farm, and there the warm smiles and bright eyes of his Sydney were ready to greet his descent from the back of his stout steed, and the bridegroom elect was ready to hold the horse; and his sons, now growing up rapidly to manhood, crowded round him; and his dog, far more respectable in appearance than the generality of Irish cottage dogs, leaped to lick his hand; and the cat, with tail erect, purred at the door; the very magpie, that Sydney loved for its love of mischief, stretched its neck through its prison bars to greet the farmer's return to his cottage home.

"There's no use in talking," said James Harragan, after the conclusion of a meal which few small farmers are able to indulge in—I mean supper. "There's no use in talking, Sydney—but I can't spare you—it's a certain fact, I cannot spare you. Furlong must find a farm near us, and live here; why, wanting my little girl, I should be like a sky without a sun."

"Farms are not to be had here—they are too valuable to be easily obtained, as you well know," replied the young man; "but sure she'll not be a day's ride from you, sir, unless, indeed, my brother should have the luck to get a farm for me that he's after by the Slaney, a little on the other side of the ferry of Mount Garrett; but that is such a bit of ground as is hard to be met with." The father hardly noticed Furlong's reply, for his eyes and thoughts were fixed upon his child, until the word "Slaney" struck upon his ear, and brought back Murphy, his proposal, his threat, and his flying horse, at once to his remembrance.

"What did you say of a farm on the Slaney?" he inquired, hastily.

"That I have the chance, the more than chance, of as purty a bit of land with a house, a slated house upon it, on the banks of the Silver Slaney, as ever was turned for wheat or barley—to say nothing of green crops, that would bato the world for quality or quantity. My brother has known the cows there yield fourteen or sixteen quarts. I did not like to say any thing about it before, for I was afraid I should never have the luck of it, but he wrote me to-day to say that he was almost sure of it, though some black-hearted villain had written letters without a name to the landlord, and agent, and steward, against us. Think of that now! We that never did a hard turn to man, woman, or child in the country."

James Harragan absolutely shuddered; and, passing his arm round Sydney's neck, drew her towards him with a sort of instinctive affection, like a bird that shelters its nestling beneath its wing, when it hears the wild-hawk's scream upon the breeze.

"Sydney shall never go there," said Harragan.

"Not go to the banks of the Slaney!" exclaimed her eldest brother. "Why, father, you don't know what a place it is—you don't know what you say. Besides, an hour and a half would take you quite easy to where Furlong means. You make a great deal too much fuss about the girl." And having so said, he stooped down and kissed her cheek, adding, "Never mind, father; I'll bring you home a daughter that'll be twice as good as Sydney. I'll just take one more summer out of myself, that's all, and then I'll marry; may be I won't show a pattern wife to the country!" And then the youth was rated on the subject of bachelors' wives. And he retaliated; and then his sister threatened to box his ears, and was not slow in putting the threat into execution; and soon afterwards, Furlong rose to return home; and Sydney remembered she had forgotten to see to the health and comforts of a delicate calf; and though the servant and her brothers all offered to go, she would attend to it herself; and, five minutes after, her father went to the door, heard her light laugh and low murmuring voice, and saw her standing with her lover in the moonlight—he outside, and she inside the garden-gate, her hand clasped within his, and resting on the little pier that was clustered round with woodbine. She looked so lovely in that clear pure light, that her father's heart ached from very anguish at the possibility of any harm happening to one so dear. He longed to ask Furlong if he knew Murphy, but a choking sensation in his throat prevented him. And when Sydney returned, he caught her to his bosom, and burst into a flood of such violent tears, as strong men seldom shed.

The poisoned chalice was approaching his own lips. What would he not have given at that moment that he had acceded to Mr Herrick's proposal!—for had Murphy's villany become public, he must have quitted the country. How did he, even then, repent that he had not yielded to his reason, instead of his prejudice!

Young Furlong was at a loss to account for the steady determination with which, at their next meeting, his intended father-in-law opposed his taking a farm in every way so advantageous; James hardly dared acknowledge to himself, much less impart to another, the dread he entertained of Steve Murphy's machinations; this was increased tenfold, when he found that he was the person who not only desired, but had offered for that identical farm a heavier rent than he would ever have been able to pay for it. The landlord, well aware of this fact, and knowing that a rack-rent destroys first the land, secondly the tenant, and ultimately the landlord's property, had decided on bestowing his pet farm as a reward to the superior skill and industry of a young man whose enemies were too cowardly to attempt to substantiate their base charges against him.

* Tipsy.

I can only repeat my often expressed desire, that every other Irish landlord acted in the same manner. It would be impossible to convey an idea of how continually James Harragan's mind dwelt upon Steve Murphy's threat; at first he tried if Sydney's love towards Furlong was to be shaken, but that he found impossible.

"If you withdraw your consent, father," she said, "after having given it, and being perfectly unable to find a single fault with him, I can only say I will not disobey you; but, father, I will never marry—I will never take to any as I took to him, nor you need not expect it—you shall not make me disobedient, father, but you may break my heart." Sydney, resigned and suffering, pained her father more than Sydney remonstrating against injustice. She had before shown him how hard it was, not only after encouraging, but actually accepting Furlong, to dismiss him without reason, and had reproached him in an agony of bitter feeling for his inconsistency. When this did not produce the desired effect, her cheek grew pale, her step languid, her eyes lost their gentle brightness, and her eldest brother ventured to tell his father "that he was digging his daughter's grave!" The disappointment of the young man beggars description; he declared he would enlist, go to sea, "quit the country," break his heart, shoot any who put "betwixt them," and, after many prayers, used every possible and impossible threat, except the one which the Irish so rarely either threaten or execute, that of self-destruction, to induce James to alter his resolution; and James, unable to stand against this domestic storm, did of course retract; and the consequence was, that he lost by this changing mood the confidence of his children, who had ever till then regarded him with the deepest affection. He dared not communicate the reason of his first change, for doing so would have betrayed the foolish and unfortunate secret he had persevered in keeping, in opposition to common sense, and the estrangement of an old and valuable friend; he could not witness the returned happiness of his children without foreboding that something was to occur that would completely destroy it; and the joyous laughter of his daughter, at one time the sweet music of his household, was sure to send him forth with an aching heart.

Nor was young Furlong without his anxieties; he received more than one anonymous letter, threatening that if he did not immediately give up all thoughts of the farm, he would suffer for it; the notices were couched in the usual terms, which, in truth, I care not to repeat; it is quite enough to say that they differed in no respect from others of a similar kind, and with a like intention. However inclined the young man might feel to despise such hints, the experience of the country unfortunately proved that they ought not to be disregarded; but his brother, stronger of heart and spirit, argued that their faction was too powerful, their friends too numerous, to leave room for fear; that their own country was (as it really is) particularly quiet; and that, as Mr Harragan was "so humoursome," the best way would be to say nothing at all about it; that it was evident those who had tried to set the landlord against them, having failed in their design, resolved to try the effect of personal intimidation; concluding by observing, "that it was the best way to go on easy," and "never heeding," until after the lease was signed, and the wedding over, and then they'd "see about it!" However consistent this mode of reasoning might be with Irish feeling, it was very sad to perceive how ready the Furlongs were to trust to the strong arm of the people, instead of appealing to the strong arm of the law. I wish the peasantry and their friends could perceive how they degrade themselves in the scale of civilised society by such a course; it is this perpetual taking of all laws, but particularly the law of revenge, into their own hands, that keeps up the hue and cry against them throughout England. I confess time has been when there was one law for the rich and another for the poor, but it is so no longer; and humane lawgivers and administrators of law grow sick at heart when they perceive that they labour in vain for the domestic peace of Ireland.

A few days before the appointed time arrived when Sydney Harragan should become Sydney Furlong, she received a written declaration of love, combined with an offer of marriage, from Murphy. He watched secretly about the neighbourhood until an opportunity arrived for him to deliver it himself. Sydney, to whom he was almost unknown, at first gave a civil yet firm refusal; but when he persevered, she became indignant, and said one or two bitter words, which he swore never to forget. She hardly knew why she concealed from her father the circumstance, which, upon consideration, she was almost tempted to believe a jest; but she did not even mention it to her brothers, fearing it might cause a quarrel, and every Irish woman knows how much easier it is commenced than quelled. Moreover, one mystery is sure to beget another.

At last the eventful day arrived—Sydney all hopes and blushes, her brothers full of frolic and fun, the bride's maids arrayed in their best, and busied in setting the house in order for the ceremony, which, according to ancient Catholic custom, was to take place in the afternoon at the dwelling of the bride.

"Did ye ever see such a frown over the face of a man in yer born days?" whispered Essy Hays to her sister-maid. "Do but just look at the masher, and see how his eyes are set on his daughter, and she reading her prayers like a good Christian, one eye out of the window and the other on her book. Well, she is a purty girl, and it's no wonder so few chances were going for others, and she to the fore."

"Speak for yourself!" exclaimed Jane Temple, tossing her fair ringlets back from her blue eyes. "She is purty for a dark-skinned girl, there's no denying it." "Dark haired, not dark skinned!" said Essy indignantly; "the darlint! She's the very moral of an angel. I wish to my heart the masher would not look at her so melancholy. May be he's thinking how like her poor dead mother she is! My! if here isn't his reverence (I know the cut of the grey mare, so fat and so smoothly jogging over the hill), and Misher Furlong not come! He went

to his brother across Ferry Carrig yesterday, and was to sleep at his aunt's in Wexford last night; I think he might have been here by this! Well! if it was me, I would be affronted; it is not very late to be sure, only for a bridegroom!"

"Whisht! Essy, will you," returned Jane, "for fear she'd hear you; I never saw so young a bride take so early to the prayers; it seems as if something hung over her and her father for trouble."

"I wonder ye're not ashamed of yerself, Jane," exclaimed the warm-hearted Essy, "to be raising trouble at such a time. Whisht! if there isn't the bridegroom's brother trotting up to the priest. What a handsome bow he makes his reverence, his hat right off his head with the flourish of a new shillalah; but, good luck to us all, what ails the masher now!"

James Harragan also had seen the bridegroom's brother as he rode up the hill which fronted their dwelling, and sprang to his feet in an instant. When the heart is fully and entirely occupied by a beloved object, and that object is absent, alarm for its safety is like an electric shock, commencing one hardly knows how, but startling in its effects. Sydney looked in her father's face and screamed; while he, dreading that she had read the half-formed thoughts which were born of fear within his bosom at the sight of the bridesman without the bridegroom, uttered an imperfect assurance that "all was well—all must be well—Ralph had waited for his aunt—old ladies required attention—and, no doubt, they would arrive together." With this assurance he hastened to the door to meet the priest and his companion, and his heart resumed its usual beatings when he observed the jovial expression of the old priest's face, and the *rollicking* air with which the bridesman bowed to the bride, who crouched behind her father, anxious to hear the earliest news, and yet held back by that sweet modesty which enshrines the hearts of my gentle countrywomen.

"Where's Ralph?" inquired the farmer, while holding the stirrup for his reverence to dismount.

"That's a *nate* question to be sure," answered his brother. "Where should he be? And so, Miss Sydney, you asked Mr Herrick to come to the wedding, and never told any one of it, by way of a surprise to us—that was very purty of you—and that's the top of his new beaver coming along the hedge. Well, it's quite time Ralph showed himself, I think, and we in waiting."

"Don't be foolish, Harry Furlong!" exclaimed the farmer, hastily. "You know very well that Ralph is not here."

"Well, that's done to the life," said the light-hearted fellow; "that's not bad for a very big—I mustn't say it before the bride; but it's as bold-faced a story as ever I heard. Not here! then, where is he?"

"With his aunt, I daresay, if you don't know," answered Essy.

"Oh, you're in the mischief, too, are you, bright-eyed one? Why, you know he's hid here on the sly to surprise us. Aunt indeed! To be sure he's with his old aunt Bell and his bride alone! What a mighty quare Irishman he must be! I'll advise him not to come to you for a character, whatever I may do; eh, Essy?"

"Will you give over bothering?" she said. "Look at the colour Sydney's turned, and see to the masher—the Lord be betwixt us and harm—none of your nonsense, but tell us where is Ralph?"

The aspect of things changed in an instant. Harry saw that his brother was not there, concealed as he had supposed him to be in mere playfulness, and knew that he was not with his aunt Bell. He knew, moreover, that he had parted from him the night before at the other side of Ferry Carrig; that he was *then* on his way to Wexford, where he had promised to meet him in the morning; that he had been to their aunt's to keep his tryste, but that he had felt no uneasiness on finding Ralph not there, concluding, that instead of going to the town, he had gone to his bride's house in the country, for which he had intended mirthfully to reproach him when they met. Now seriously alarmed, his anxiety to prevent Sydney from partaking of his feelings almost deprived him of the power of speech; but he had said enough, and, just as Mr Herrick crossed the threshold, the bride fainted at his feet.

Nothing could be more appalling than the change effected in a few moments in the expression of the farmer's face. While each was engaged in imparting to the other hopes for the bridegroom's reappearance, and reasons for his delay, Harragan, having put forth every other assistance, was bending over his insensible child, on the very bed from which she had that morning risen in the fulness of almost certain happiness for years to come. Alas! how little can we tell upon what of all we cherish in this changing world, each rising sun may set!

"If she's not dead," he muttered to himself, "she will die soon. May the Lord deliver me!—the Lord deliver me!" he continued, while chafing her temples; "I saw it all along, like a shroud above me, to fall round her—I did—I did. Who's that?" he inquired, fiercely, as the door gently opened, and Mr Herrick entered within its sanctuary; "oh, it's you, sir, is it? you may come in; I thought it was some of them light-hearted who don't know trouble. Shut them out; my trouble's heavy, sir; look at her, Misher Herrick; and this was the wedding my little girl asked you to, out of friendliness to her father. *Her* father! why, the Holy Father who is above us all knows that as sure as the beams of the blessed sun are shining on her deathly cheek, so sure am I Ralph Furlong's murderer! You need not draw back, Mr Herrick. I know he's murdered; I felt struck with the knowledge of his death, and I could not help it, the minute his brother (God help him!) laughed in my face. Don't raise up her head, sir; she'll come to soon enough—too soon, like a spirit that comes to the earth but to leave it. I'm not mad, Mr Herrick, though maybe I look so. Be it by fire or water, or steel or bullet, Ralph Furlong's a corpse, and I'll inform this time. I've heard tell the man that betrayed Christ wept after. What good war his tears? What good my informing now? but I will—I will. I'll make a clean breast for onst. I'll do the right thing now, if all the devils of hell tear me into pieces! I tell you, sir,

Steve Murphy did it!—black-hearted, cunning-headed, and bloody-handed he was, from the time his mother begged with him from door to door for what she did not want, and taught him lies by every hedgerow and green bank through the country. I'm punished, Mr Herrick, I'm punished. If I'd informed—but I'll not call it informing—if I'd told the truth when you wanted me about the letters of the forge, he would not have been in the country to commit murder. She's coming to, now, sir; she's coming to."

Gradually poor Sydney revived, but only to suffer more than she had as yet gone through. The people were greatly astonished at the conviction which rested on the farmer's mind that the young man had been murdered, a belief which extended itself to his daughter; for, from the moment she heard that Ralph was not with his aunt, it appeared as if every vestige of hope had vanished from her mind. The men of the company set forward an immediate inquiry; the neighbourhood poured forth, every cottage was emptied of its inmates, the women flocking to the farmer's house to pour consolation and hope into the bosom of the bereaved bride, and the men to assist in a search, which, at the noon-day hour, was a very uncommon occurrence. It is very rarely, indeed, that the Irish peasantry seek assistance either from the police or military force; though they are fond of going to law, they detest those connected with the law. But Mr Herrick promptly rode into Wexford, and having made the necessary inquiries, and ascertained that young Furlong had not been seen at the town, he informed the proper authorities of his mysterious disappearance, and then turned his horse towards Ferry Carrig, to ascertain from the gate-keeper who had passed over the bridge the preceding evening.

Ferry Carrig is one of the picturesque spots which are not so frequently seen by those who journey through my native country. On one side of the Slaney—here a river of glorious width—rises, boldly and wildly, a conical hill, upon the summit of which stands out, in frowning ruins, one of the boldest of the square towers, of which so many were erected by the enterprising Fitz-Stephen. The opposite side of the bridge is guarded by a rock, not so steep or so magnificent as its neighbour, but not less picturesque, though its character is different; the one is absolutely garlanded with heaths, wild-flowers, and the golden-blossomed furze; while the other, affording barely a spot for vegetation, seems planted for eternity—so stern, and fixed, and rugged, that nothing save the destruction of the universe could shake its foundation.

The bridge erected across this beautiful water is of singular construction, and partakes of the wildness of the scene; the planks are not fastened at either end, and the noise and motion has a startling effect to one not accustomed to such modes of transit. When Mr Herrick arrived at the toll-house, he learned that many inquiries had already been made, and that all the toll-keeper could say was, "that positively Ralph Furlong, whom he knew as well as his own son, had not crossed the bridge the preceding evening, although he had been on the look-out for him." The elder Furlong had accompanied his brother to within a mile of the Eniscorthy side of the bridge, so his disappearance must have occurred between the spot where they separated and the Bridge of Ferry Carrig. Nothing could exceed the energy and exertion to discover the lost bridegroom; every inquiry was made, every break explored, the rivers dragged, but no trace of Ralph Furlong was obtained. Mr Herrick returned to the farm, and it was heart-breaking to observe the totally hopeless expression of Sydney's beautiful face.

"There is no knowing," said the kind gentleman, with a cheerfulness he but imperfectly assumed; "there is no knowing—he may have left the country."

"No," was her reply; "he would never have deserted me!" Thus did her trust in her lover's fidelity outlive all hope of meeting him alive in this changing world.

In the meantime, James Harragan had proceeded alone to Steve Murphy's cottage. The sun had set, when he found him sitting by his fire, not alone, for his sister was seated on the opposite side.

Harragan entered with the determined air of a desperate man, and neither gave salutation, nor returned that which was given.

"I come," said he, "to ask you where you have hid Ralph Furlong." The man started and changed colour, and then assuming a bold and determined air of defiance, hesitated not to inquire what the farmer meant, who, in reply, as boldly taxed him with the murder. Hard and desperate words succeeded, and the screams of the accused man's sister most likely prevented death, for the farmer, a tall powerful man, had grasped Murphy so tightly by the throat, that a few minutes must have terminated his existence. Although by no means a weakling, he was as a green willow wand in the hands of his assailant.

In vain did his terrified sister declare that her brother was at home early in the evening, and went to bed before she did. Harragan persisted in his charge; and had it not been for the force of superior numbers, he would have succeeded in dragging him to the next police station; but Irish assistance is much more easily procured against the law, than for it, though, I confess, in this instance it was hard for those who did not know all the circumstances to determine whose part to take, for Harragan was under the influence of such strong excitement, that he acted more like a maniac than a man in the possession of his senses.

Having failed in his first object, that of dragging Steve Murphy to justice himself, he mounted his horse, and hid before the nearest magistrate sufficient reason why Steve should be arrested, and detained until further inquiries were made; but when the police force sought for him, he was gone!—vanished! as delinquents vanish in Ireland, where hundreds of sober honest men will absolutely know where a villain is concealed, and yet suffer him to escape and commit more crimes, because their prejudices will not suffer them to inform.

Great was the excitement throughout the country, occasioned by this mysterious event. James Harragan

lived but for one object, that of bringing the murderer to justice. This all-engrossing desire seemed to have absorbed even his affection for his child, that is to say, he would stroke her hair, or press her now colourless cheek to his bosom, and then, turning away with a deep sigh, go on laying down some new plan for the discovery of poor Ralph's murderer. Every body said that Sydney was dying, but her father did not seem to observe that her summer had ceased, when its sun was at the hottest, and its days at the longest, and that the rose was dropping leaf by leaf to the earth. Once Sydney attempted to take the produce of her dairy, which her kind friend Essy tended with more care than her own, to the market.

"If they don't notice me," she said, "I'll do bravely; you'll tell them, Essy, to never heed me." And so Essy did, but it would not do. No prudential motive yet was ever sufficiently strong to restrain the sympathy of the genuine Irish. Twenty stout arms were extended when her car stopped at the corner of the market-place to lift the pale girl off. There was not a woman in the square that did not leave her standing, and crowd round the widowed bride. It would have been as easy to turn the fertilising waters of the Nile, as to turn that torrent of affection. The young girls sobbed, and could not speak for tears; but those tears fell upon Sydney's hands, and moistened her cheeks; it was refreshing to them, for she herself had long ceased to weep; hers were the only dry eyes in the crowd. The mothers prayed that God might bless her, and "raise her up again to be the flower of the country."

"Never heed, Sydney darlint; sure you've the prayers of the country."

"And the double prayers of the poor," exclaimed a knof of beggars, who had abated their vocation to put up their petitions in her favour.

Sydney could have borne coldness or neglect, but kindness overpowered her, and she was obliged to return, leaving her small merchandise to Essy's care.

Every one said that Sydney was hastening to her grave, but still her father heeded it not; no bloodhound ever toiled or panted more eagerly to recover the scent which he had lost, than did the farmer to trace Steve Murphy's flight; it was still his absorbing idea, both by day and night. Had it not been for the exertions of his sons, his well-cultivated farm would have gone to ruin. His health was suffering from this monomania; the flesh shrank daily from his bones; and the healthy young farmer was changing into a gigantic skeleton. The priest talked to him, Mr Herrick reasoned with him, but all to no purpose.

Time passed, and James Harragan entered his cottage as the sun was setting. He had stood for the last hour leaning against the post of his gate, apparently engaged in watching the sparrows flying in and out of their old dwelling-places in the thatch. His sons had prepared his supper, and he sat down mechanically in his old place; the two lads whispered for some time together at the window, when suddenly Harragan inquired "what they muttered for?" The youths hesitated to reply.

"Let me know what it was!" he exclaimed. "I'll have no whispering, no cooing, no hiding and seeking in my house. Boys, there's a hell at this moment burning in yer father's breast! Look, I never could kill one of them small birds that destroy the roof above our heads, without feeling I took from the innocent thing the life I couldn't give; and yet, what does that signify? Isn't my hand red at this time of speaking with that boy's blood! Red—it's red hot—hissing red with the blood of Ralph Furlong! It is as much so as if I did it! And why?—because I held on at the mystery that shades the guilty, and hurries on the innocent to destruction—because I wouldn't inform! Now, mind me, boys, I'll have nothing but out speaking; no whispering; where there's that sort of secrecy, there's sin and the curse. What war you whispering?" he added, in a voice of thunder.

"We war only saying, sir," replied the elder, "that we wonder Sydney and Essy ain't back."

"Back! Why, where is my little girl?"

"She took a thought this morning, sir," he answered, "and we don't like to say against her, that she'd walk from Ferry Carrig Bridge to where he parted from his brother, and took Essy with her on the car as far as the bridge; it's a notion she had."

"My colleen!—my pride!—my darlint!" he ejaculated, much moved, "and I not to know this! Yer mother little thought when she made ye over to me before death made her over to the holy angels, what would happen. And ye didn't tell me, because ye thought I didn't care! Well, I forgive ye—I forgive ye, boys! I didn't neglect her though, for all that; my heart was set on another matter. There is but one thing she can spake on, one thing I can spake on—and it is better we shouldn't—but, and when she does look at me, though my little girl strives to keep it under, there is in her eyes what says, 'If ye had spoken the truth long ago, it's a happy wife I'd be now instead of —' Oh, God!—oh, God!" he exclaimed passionately, "that I should have suffered such a snake to fatten on the land, when I could have crushed him under my heel! I'd have rest in my grave if I could see him in his. I'll go meet her, boys. You should have gone before." And the farmer stalked forth, and, silently mounting his cob, proceeded on the road to Ferry Carrig.

There are mysteries around us, both night and day, for which it would be difficult indeed to account; and the impulse that drew Sydney that morning to the banks of the Slaney, was, and ever must be, unaccountable.

"Nurses," she said to her faithful friend Essy, after they crossed the bridge, and, quitting the coach-road, made unto themselves a path along the bank; "nurses like you, Essy, may be called the brides'-maids of death, and you have been my nurse all through this sickness." Essy afterwards said she did not know what there was in those words to make her cry, but she could not answer for weeping. The two girls wandered on, Sydney stopping every now and then to look into the depths and shallows of the river, and prying beneath every broad green leaf and clump of trees that overhung its banks.

More than once they sat down, and more than once did Essy propose their return, but Sydney went on, as if she had not spoken. At last they came to a species of deep drain, almost overgrown with strong, tall, leafy, water-plants, that was always filled when the tide was full in. Essy sprang lightly over it, and then turning a little way up to where it was narrower, she extended her hand to her feeble friend. Although the gulf was narrow, it was very deep; the root of a tree had formed a natural dam across it, so that much water was retained. As Sydney was about to cross, she cast her eyes beneath, started, and held back. She did not speak, but, with her hand pointed downwards, Essy's shriek rang through the air—the face of Ralph Furlong stared at them from the bottom of the silent pool!

Had she not removed the broad leaves of a huge dock that shaded the water, so that Sydney's footing might be sure, the unconscious girl would have stepped without knowing it over her lover's liquid grave. Essy was so overwhelmed with horror, that she ran shrieking towards the highway; several minutes elapsed before she returned with assistance; and then where was Sydney! The faithful girl, in endeavouring to draw his body from the waters, had fallen in; her head was literally resting on his bosom, and her long beautiful hair floating like a pall above them!

They were buried in the same grave!

When Murphy's cottage was searched by the police, the only weapon, if so it could be called, which they discovered, was a broken reaping-hook; this James Harragan had taken to his own house, and in the folds of poor Ralph's coat, those who prepared him for his earthly grave discovered the missing portion. The farmer was seen to shed no tear over his daughter, but registered an oath in heaven that he would never take rest upon his bed until he had brought the murderer to justice. Within a week after, he relinquished his farm to his sons, and it is believed he has journeyed to foreign lands in pursuit of one, who, in the first instance, escaped justice through James Harragan's own weak and almost wicked perseverance in a wrong cause. Years have passed since the melancholy event occurred, and no tidings have ever reached the county relative to Harragan or the murderer. Well, indeed, may he remember Mr Herrick's warning. The farmer had, by withholding his information, refused to pluck out the arrow which an unseen hand had planted in the bosom of an excellent and industrious man, and the same power had been employed to overthrow his happiness for ever!

PROPOSED NEW PLAN OF POSTAGE.

ABOUT two years ago, when the subject of a cheap system of postage began to be agitated in the country, we offered a few explanatory observations on it, and took occasion to point out what we considered to be faults in the proposed plan. The recent publication of the "Third Report from the Select Committee of the House of Commons on Postage," throws a body of new light upon this most important branch of social economy, and enables us to take up the new plan in a much more satisfactory manner than when we had only a few facts from a private pamphleteer to guide us.

It would, we think, be a complete waste of our limited space to go into a lengthened proof of the injury done to society by the present dear mode of transmitting letters by post. That dearth is matter of universal complaint, and leads to all manner of evasions of posting, suppresses correspondence to an incalculable extent, and forms a tax of serious amount on trade and commerce. According to the Report before us, "it is injurious to all classes, socially and individually interfering with their moral and intellectual improvement, and with their physical welfare; obstructive to trade, as checking the free dissemination of invoices, orders, and the like; to science, as circumscribing the operations of different learned societies; to knowledge, as offering an impediment to the publication of books; to health, as preventing the transmission of medical advice, and lymph for vaccination; to justice, by opposing increased expense and delay to legal proceedings; to the poor, as imposing a grievous tax on their letters; and to public morals, as leading to evasions of the law, to the impairing of that habitual respect, which, for the good of all, it is well that all should entertain."

With respect to the evasions of posting, the Report presents some curious facts, such, for example, as the communication of intelligence by means of marks on newspapers, which must be familiar to many of our readers. No species of enactments can prevent these evasions. For instance, what law could check the following plan of evasion, which has come under our notice. A gentleman goes upon a journey through a series of towns, and gives his friends at home full intelligence of his movements by simply writing a fictitious address on a newspaper to the care of the real person to whom the paper is sent—thus, "Mr London of Tuesday Street, care of Mr Johnston, 110, Thistle Street, Edinburgh"—by which the said Mr Johnston knows that his friend reached London on Tuesday. Or, take the following—"Lady Jenkins Sonborn, of Castle Mundy, care of Mrs Williams, 67, St James's Square, London;" by which the said Mrs Williams learns that her friend Lady Jenkins has been safely delivered of a son on Monday. We repeat, no penal statute can reach such rogueries as these, and to expect people to desist from them, is to expect too much from human nature: the very drollery of the thing causes them to be practised by individuals who would scorn to commit a moral transgression. The Report of the Committee bears a similar testimony—"The practice of illicit conveyance of let-

ters prevails to a large and increasing extent, favoured by the high rates, for the most part, but partly from want of sufficient opportunities for dispatching letters through proper channels; the law has been found impotent to repress this practice; and, if it could be repressed, a most serious evil would be inflicted on society, with no corresponding advantage to the revenue; and no effectual remedy can be supplied otherwise than by reducing the legal rates to the level of the illicit trader, in which case the committee are of opinion that the superior regularity and safety of the post would draw all letters into that channel, and effectually repress the evasions which perpetually take place by means of conventional modes of communications by marks on newspapers."

Another monstrous abuse consists in the practice of sending letters by franks. It is impossible to speak with any degree of patience of this practice, by which, in point of fact, the wealthy or the friends of certain officials and members of the legislature get their letters conveyed all over the country for nothing, while from persons in business, the labouring poor, and public generally, high rates of postage are exacted. It appears from the Report that the number of franked letters passing through the Post-Office amounts to an eleventh of the whole—the total of chargeable letters being 78,000,000, while the franked are 7,036,000, annually. By adding 44,500,000 newspapers, we have the sum-total of the material carried yearly by the mails.

In consequence of the immense extent of illicit conveyance of letters, also of the system of franking, and the general diminution of literary intercourse, the revenue of the Post-Office is on the whole a very small affair. For the year ending the 5th of January 1838, after deducting L.698,632, 2s. 2d. for cost of management, the revenue left was only L.1,641,105, 16s. 1d. Little more than a million and a half of profit on the enormous business of transmitting all the post letters in the United Kingdom! The increase, as it appears, is only L.3578 annually, which is much below what would be warranted by the increase of population and commerce.

The principal part of the expense of the Post-Office establishment consists of the charges incurred for receiving, sorting, and delivering the letters. In comparison of these expenses, the cost of transmission by mails is small and unimportant. "As all letters, whether going to a short distance or to a great distance, must be both received and delivered, the chief expenses are common to all; and the total cost, therefore, is much the same, whatever the distance may be to which the letter is carried. It is not a matter of inference, but a matter of fact, that the expense to the Post-Office is practically the same, whether a letter goes from London to Barnet [12 miles], or from London to Edinburgh [400 miles]. The difference is not expressible in the smallest coin we have. It is undeniable that letters could be sent from London to Edinburgh by an ordinary coach parcel, at a cost of somewhat less than one-tenth of a penny each."—Report.

It being thus allowed by a fair calculation that distance in transmission is practically of no consequence, the idea has been suggested that all letters whatsoever should be subject to a uniform rate of postage, and that, to extinguish illicit conveyance, and serve the country, the rate should be very small. The individual who has the credit of having first made this proposition is Mr Rowland Hill, the special examination of whose plan formed one of the objects of the committee. Mr Hill's plan embraces the following points:

1. That all letters not exceeding half an ounce in weight, should be conveyed from any one place in the United Kingdom to any other, for the charge of 1d.

2. That all letters exceeding half an ounce in weight, should be subject to an additional penny for every additional half ounce.

3. That such postage should be paid in advance.

4. That the postage shall be collected in advance by the sale of stamped paper or stamped paper covers; and that in order to facilitate obtaining stamps in any distant place, every keeper of a Post-Office shall have them constantly on sale.

In the very first instance, it might be necessary to allow an option to the public to pay 1d. in advance, or 2d. on delivery; but it was desirable to get rid of the option as soon as the circumstances of the case would permit."

In formerly treating of this subject, we expressed an opinion that payment of the penny in advance, or sending a letter under a penny stamped cover, however admirable an arrangement for simplifying the duties of the Post-Office officials, would be found not to work well. We have still the same fear. Under the existing arrangements, few persons pay letters in advance who are desirous of having them delivered in due course of post. It is believed that the obligation to get money for a letter quickens the diligence of the deliverers, in respect both to discovering the residence of an obscure person, and to taking the letter to that person at the first round of delivery. Mr Hill, we believe, has foreseen that objections of this nature would be urged against his plan of paying in advance, and proposes to overcome the difficulty, by giving a right to seek receipts for letters on committing them to the care of the Post-Office. Should this or some other means of checking irregularities be established, our fears for the success of the plan would at once be allayed.

It has been computed by the committee that the adoption of an uniform rate of a penny for each letter of half an ounce or under, by increasing the number of chargeable letters to four hundred millions, would cause a loss to the public revenue of about L.300,000 annually. The deficiency, however, Mr Hill considers, would be made good by the beneficial effect which the great extension given to the correspondence of the country would have on the other branches of the revenue. Every branch of trade and commerce would be improved, he conceives, by cheap correspondence. Of this, indeed, no rational thinker can have the smallest doubt. Thousands of small orders for goods would pour into the large towns from the country, and increase the consumption of many excisable articles. At present no such orders can be sent.

After a lengthened scrutiny into all departments of the subject, the committee concludes its Report with the following among other resolutions:—

"That so soon as the state of the public revenue will admit of the risking a larger temporary reduction, it will be expedient to subject all inland letters to a uniform rate of 1d. per half ounce, increasing at the rate of 1d. for each additional half ounce.

That prior to establishing the uniform rate of 1d., it would be expedient, in the first instance, to reduce the rates on inland general post letters to a uniform rate of 2d. per half ounce, increasing at the rate of 1d. for each additional half ounce; reserving all the cases of prices current, the letters of soldiers and sailors, and others, where a penny only is now charged, and of such short inland rates as are hereafter recommended to be charged on a distance of 15 miles.

That, considering the strength of concurrent evidence on the evasion of postage between neighbouring towns, and also that the present system of penny-posts is partial and unequal, a uniform rate of 1d. per half ounce ought immediately to be established for all distances not exceeding 15 miles from the Post-Office where the letter is posted, the payment being made in advance, through the medium of some kind of stamp; and that the charge when not paid in advance should be 2d.

That it would be politic in a financial point of view, and agreeable to the public sense of justice, if, in effecting the proposed reduction of postage, the privilege of parliamentary franking were to be abolished, and the privilege of official franking placed under strict limitation; petitions to Parliament, and parliamentary documents, being still allowed to go free."

Such being the singularly liberal recommendations of the committee in this most important subject of general concern, the matter may be said to rest in a great measure betwixt the country at large and the ministers of the crown who are charged with the management of the public revenue. It can, we think, admit of no doubt that the establishment of either an universal penny or twopenny postage would be hailed as an immense boon by all classes of the people, and, along with the organisation of railways now in progress, would give such an impetus to all branches of internal commerce as would carry the country through all its social embarrassments.

ODD LONDON CHARACTERS OF FORMER TIMES.

FRANCIS GROSE, THE ANTIQUARY.

FRANCIS GROSE was the son of an individual of the same name, who carried on the business of a jeweller at Richmond, and had been employed to fit up the coronation-crown of George II. The father must have been a man of tastes superior to those of common tradesmen in his day, as, at his death in 1769, he left a collection of prints and shells, which were thought worthy of being brought to a public sale. Two other sons besides the subject of the present notice became authors; namely, Mr John Grose, F.A.S., Chaplain of the Tower, who published a volume on Ethics, and some sermons; and Mr John Henry Grose, author of "A Voyage to the East Indies," which appeared in 1772. The wealth left by the father to our antiquary was sufficient to have made him independent for life; but it did not last long. Of a gay and easy nature, he was little fitted to take care of money, whether belonging to himself or others. Having entered the Hampshire militia, and undertaken the duties of its adjutant and paymaster, he used no other accomplishments, as himself used to tell in after years, but his right and left hand pockets. In the one he received; from the other he paid; the balance might at any time of course be struck by counting the contents of the one against the other; but that this was not done very frequently, may readily be surmised. At a subsequent period, Mr Grose was a captain in the Surrey militia: such was the whole extent of his military career. Already, though only about thirty, he had acquired that Falstaff-like figure for which he ever after was remarkable, and which suited so well with his good-humoured character.

When carelessness and love of pleasure brought their usual consequences in pecuniary embarrassment,

Grose was roused to the exercise of talents which might have otherwise remained dormant. He projected an extensive and valuable work, for which the gift of the artist and the learning of the historical antiquary were alike necessary, namely, his "Antiquities of England and Wales," the first Number of which appeared in 1773. Ultimately, this work comprehended, in eight quarto volumes, five hundred and eighty-nine views of antique objects, besides forty plans, many head-pieces, and a variety of minor draughts, all executed by himself, and illustrated by appropriate letter-press, including illustrative dissertations on monastic institutions, castles, Gothic architecture, and Druidical and sepulchral monuments. The publication met with distinguished success, and encouraged the author to enter upon another task of an almost equally laborious nature, his "Military Antiquities, respecting a History of the English Army, from the Conquest to the Present Time," which was published in numbers between the years 1786 and 1788, and ultimately formed two volumes, quarto. While occupied with this latter work, he published a smaller one of a kindred nature, "A Treatise on Ancient Armour and Weapons, illustrated by Plates taken from the Original Armour in the Tower of London, and other Arsenals, Museums, and Cabinets;" 1785, quarto.

The cheerfulness and comicality of Grose's nature suffered no diminution while he was engaged in these grave duties. While acknowledged by other men to possess much learning, literary talent in no small amount, and an uncommon felicity in the use of the pencil, he had no pride or reserve, and hence was ready to condescend to tasks which other men were apt to think unworthy of his reputation. Of this nature were his "Dictionary of the Vulgar Tongue" and his "Provincial Glossary," which respectively appeared in 1785 and 1788. The first is a mere collection of cant and slang terms, with their proper explanations, forming a volume certainly not without some power of amusing, and even of informing, but yet one which the world were better wanting than having. Some of the *roccs* serve to keep in mind matters connected with history, as, for instance—"USED UP: killed": a military saying originating from a message sent by the late General Guise, on the expedition at Cartlagena, where he desired the commander-in-chief to order him some more grenadiers, for those he had were all *used up*." Mr Grose also published, under the title of "A Guide to Health, Beauty, Honour, and Riches," a curious collection of the quack advertisements which had appeared during many years in the London newspapers, holding forth those blessings to mankind. With this he gave a preface, in which, with Addisonian humour, he endeavoured to prove, by means of these advertisements, that the advances made of late years in natural science were not exceeded by those made in all the arts and conveniences of life. "Justice," says he, "makes it necessary to observe and commend the spirit of philanthropy reigning among the several ingenious professors of the different arts, sciences, and callings, who, like Mr Ashley the punch-maker on Ludgate Hill, and that second Taliacontius Mr Patence, surgeon by birth, dentist, and dancing-master, do not consult their own emolument, but labour solely *pro bono publico*." * * Indeed, the self-denial of one of these gentlemen is rarely to be paralleled, as, at the very instant he with the most unbounded generosity offers thousands to persons unknown, himself labours under the frowns of fortune, as he acknowledges by his letter from the King's Bench.

Does a lady," he continues, "show signs of an ungraceful shape, Mr Parsons, by his well-turned stays, prevents that misfortune: has it already taken place, the same artist will completely hide it. Irregular or decayed teeth give place to those of Mr Patence with six different enamels; and that wonderful operator replaces fallen noses, uvulas, broken jaw-bones, and, in a word, cures all the disorders to which the human frame is liable, as he offers clearly to prove by occult demonstration; being, to use his own words, *mechanically accented and anatomically perfected in the human structure*. Persons suffering under the racking paroxysms of the gout, so as to be unable to move, are radically cured of that terrible disorder by the month, the year, or for life, without medicine, by muscular motion only; or by another secret, which the generous possessor offers to communicate to the public for the trifling sum of twenty thousand pounds: and all the disorders contained in the catalogue of human misery yield to the wonderful baths of Dr Dominicetti, whence, like Eason from the kettle of Medea, the patient springs out totally renovated. But, as Dr Shee well observes, prevention is certainly even better than a cure. Mrs Phillips steps modestly in with the offer of her wares, prepared with the result of thirty-five years' experience. This public-spirited matron informs us, that, after ten years' retirement from business, she has resumed it again, from representations that, since her recess, goods comparable to what she used to vend cannot be procured. Another lady of the same profession, Mrs Perkins, attempts to deny the authenticity of this account, and, with a proper disapprobation of infamous publications, declares herself the true successor of the late Mrs Phillips.

The grand scale on which business is carried on by our professors and artists in different walks, reflects an importance and dignity on the nation, as well as points out the enlarged ideas of those gentlemen. Thus, Mr Perfect, of Town-Malling, does not, like

former keepers of madhouses, take in lunatics; his more comprehensive mansion lodges and boards lunacy itself. Mr Pinchbeck, painter-in-general, executes all branches of his business from a hovel to a palace, and from a whisky to a stage-coach; and the ingenious Mr John Callway, the chimney-sweeper, does not, like his brethren, put out the fire in chimneys, but, acting on a larger scale, extinguishes the chimneys.

That the occult science called white magic, and the study of astrology, flourish among us, is evident from the handbills of Mrs Corbyn from Germany, who answers all lawful questions; Mrs Edwards, who dedicates her knowledge to the ladies; Mr William Jones's nephew, the second, last, and only survivor of his family; the person who discovers whether affections are sincere; and that gifted sage of St Martin's Lane, who cures the toothache by a sweet-scented letter.

The science of adorning and beautifying the human form seems to be systematically cultivated by many artists of all denominations, as is evident from the institution of academies for hair-dressing; and, among the gentlemen of the comb and razor, it would be wrong to pass over the two men who have the neatest barbers' shops in London, the modesty of whose prices demands the acknowledgments of the public. The professors of the cosmetic art offer innumerable pastes, washes, pomades, and perfumes, by which the ravages of time are prevented or counteracted. Even our public spectacles bespeak a degree of improvement hitherto unknown: witness that wonderful wonder of all wonders, the brave soldier and learned Doctor Katterfelto, whose courage and learning are only equalled by his honesty and love for his country; the first evinced in his returning the L.2000 to Captain Paterson, and the second in remaining here though unpensioned, notwithstanding the many offers from the Queen of France, the request of his friend and correspondent Dr Franklin, and the positive commands of the King of Prussia.

Mr Powell, the Fire-Eater, is undoubtedly, as his motto observes, a singular genius. Nor are the performances of Messrs Astley and Hughes less remarkable, though I am sorry to be under the necessity of making an exception to part of their exhibitions as being liable to increase that spirit of expense and luxury too prevalent among us. The article I allude to is that of showing that one person may ride on several horses at the same time; a practice that may possibly become fashionable among the vain and extravagant; whereas, had they introduced some method by which one horse would be enabled to carry a greater number of persons than usual, their discovery would have been truly commendable. By the diligence of our keepers of itinerant menageries, we are indulged with the sight of the learned dog, the wonderful bird, and the surprising unicorn, with divers others too numerous to mention.

The Bottle-Conjuror appears to have been an impostor, and what he promised to perform seems to have been possible alone to those choir-singers who can officiate at two places at the same time.

Candour has obliged me to insert some articles which do not tend to the honour of the parties concerned, or that of the country wherein they suffered; such as those relative to the sale of seats in parliament, and guardians offering to dispose of their wards. For the first, it is no new matter, having been the usage time out of mind: and for the other, the selfishness of the proposal serves, like shade in a picture, or discord in music, to form a contrast, and set off the disinterested offers of other advertisers."—&c. &c.

In this playful style, under the title of *The Grumbler*, Grose composed a series of papers, which he published in a newspaper. They display considerable knowledge of the world, and no small amount of shrewd good sense. The reader will find them, together with a great variety of little comic pieces, in prose and verse, and many table stories and anecdotes, in a volume entitled *The Olio*, published the year after the author's death. From the *Olio*, better than from any other of his works, we get an idea of the character of Grose, droll, garrulous, good-natured, yet withal judicious and penetrating. His only other humorous production was one entitled "Rules for drawing Caricatures—the subject illustrated with four copper-plates; with an Essay on Comic Painting."

In the summer of 1789, he made a tour in Scotland for the purpose of composing, respecting that country, a work similar to his *Antiquities of England and Wales*. In the course of his rambles, while enjoying the hospitality of a brother antiquary, Mr Riddel of Glenriddel, at Friars' Carse in Dumfriesshire, he met the poet Burns, who then resided on a neighbouring farm. With kindred talents, and a common sociality of nature, Grose and Burns could not fail to become friends. The poet expressed a wish that the projected "Antiquities of Scotland" should comprehend a sketch of Alloway Kirk, near Ayr—an object endeared to him from early recollections; and the antiquary promised to gratify him on condition that he should communicate in writing, for insertion in the book, some of the strange tales of diablerie which he had just related respecting the ruin. This, it is well known, led to the composition of the tale of "Tam o' Shanter," which was first published in the "Antiquities of Scotland." This work began to appear in the year 1790, and was completed next year in two volumes, quarto: the preface makes grateful allusion to the *pretty tale* contributed by the Ayrshire bard. During his Scottish ramble, Grose visited Edinburgh, where the limner Kay took a stolen sketch of his portly figure, representing him in striped vest,

riding coat, and boots, and a chin like that of the pelican, water-provisioned for a walk across the desert. At this time Grose was accompanied by a young man who assisted him in the taking of his drawings, and whom he denominated his *Guinea Pig*. The impression made on Burns's mind by his gleesome manners and devout zeal as an antiquary (a kind of character new and strange to the poet) is shown in the well-known verses he wrote "on Captain Grose's Peregrinations in Scotland:"

"Hear, land o' Cakes, and brither Scots,
Frae Maiden-kirk to Johnnie Groat's,
If there's a hole in a' your coats,
I rede ye, tent it;
A chiel's amang you, takin' notes,
And, faith, he'll prent it.

If in your bounds ye chance to light
Upon a fine fat fodge light,
O' stature short, but genius bright,
That's he, mark weel—
And, wow! he has an unco slight
O' cauk and keel.

By some auld howlet-haunted biggin,
Or kirk deserted by its riggin,
It's ten to ane ye'll find him snug in
Some eldritch part"—&c.

In the spring of 1791, Grose set out for Ireland, with the design of sketching the antiquities of that kingdom; and he had proceeded a certain way with his task, when, sitting one afternoon at dinner in the house of his friend Mr Hone, he was suddenly struck with apoplexy, and almost immediately expired. A few days afterwards, the following appeared in a newspaper, as a proper inscription for his tomb:—

"Here lies Francis Grose.
On Thursday, May 12, 1791,
Death put an end to his
Views and Prospects."

Some years before, a Sketch of Grose was written in verse by a friend of his, named Davis, residing at Wandsworth: it conveys so lively a picture of the man, that we transfer the most of it to our pages:—

"Grose to my pen a theme supplies,
With life and laughter in his eyes.
Oh! how I can survey with pleasure,
His breast and shoulders' ample measure;
His dimpled chin, his rosy cheek,
His skin from inward lining sleek.

When to my house he deigns to pass
Through miry ways, to take a glass,
How gladly entering in I see
His belly's vast rotundity!
But though so fat, he beats the leaner
In ease, and bodily demeanour;
And in that mass of flesh so droll
Resides a social, gen'rous soul.

Humble—and modest to excess,
Nor conscious of his worthiness,
He's yet too proud to worship state,
And haunt with courtly bend the great.
He draws not for an idle word,
Like modern duellists, his sword,
But shows upon a gross affront,
The valour of a Bellamont.

On comic themes, in grave disputes,
His sense the nicest palate suits;
And more, he's with good nature blest,
Which gives to sense superior zest.

His age, if you are nice to know,
Some two and forty years ago,
Euphrosyne upon his birth
Smil'd gracious, and the god of mirth
O'er bowls of nectar spoke his joy,
And promis'd vigour to the boy.

With Horace, if in height compar'd,
He somewhat overtops the bard;
Like Virgil, too, I must confess,
He's rather negligent in dress;
Restless besides, he loves to roam,
And when he seems most fix'd at home,
Grows quickly tir'd, and breaks his tether,
And scours away in spite of weather;
Perhaps by sudden start to France
Or else to Ireland takes a dance;
Or schemes for Italy pursues,
Or seeks in England other views;
And though still plump, and in good case,
He sails or rides from place to place,
So oft to various parts has been,
So much of towns and manners seen,
He yet with learning keeps alliance,
Far travell'd in the books of science;
Knows more, I can't tell how, than those
Who pore whole years on verse and prose;
And while through pond'rous works they toil,
Turn pallid by the midnight oil.

He's judg'd, as artist, to inherit
No small degree of Hogarth's spirit;
Whether he draws from London air
The cit swift driving in his chair,
O'erturn'd with precious sirlolin's load,
And frighted madam in the road;
While to their darling will they haste,
So fine in Asiatic taste.

Or bastard sworn to simple loon:
Or sets that dance to Satan's tune.
Deep in antiquity he's read,
And though at college never bred,
As much of things appears to know,
As erst knew Leland, Herne, or Stowe;
Brings many a proof and shrewd conjecture
Concerning Gothic architecture:
Explains how by mechanic force
Was thrown of old stone, man, or horse;

Describes the kitchen high and wide,
That lusty abbot's paunch supplied;
Of ancient structures writes the same,
And on their ruins builds his name.

Oh, late may, by the fates' decree,
My friend's Metempsychosis be,
But when the time of change shall come,
And Atropos shall seal his doom,
Round some old castle let him play,
The brisk Ephemeron of a day;
Then from the short-liv'd race escape,
To please again in human shape."

MR VENABLES' BOOK ON RUSSIA.

ONE of the most pleasing and instructive works upon Russia which we have received from the press of late years, is one now in our hands, bearing the title of "Domestic Scenes in Russia: in a Series of Letters describing a Year's Residence in that country, chiefly in the Interior: by the Rev. R. Lister Venables, M.A." A connection, by marriage, with a Russian family of high respectability, resident in the heart of the country, and nearly in the line between St Petersburg and Moscow, led to the visit which the reverend author has here described in detail. He landed at St Petersburg on the 21st of June 1837, and after a stay of nine days, set out for Torjok in a sort of diligence, capable of holding four persons, and drawn by four horses placed abreast. The distance between the capital and Torjok is about three hundred and eighty miles, but Mr Venables was obliged to pay for the whole journey to Moscow, which is one hundred and fifty miles farther. The sum charged was L.16 sterling, which, after all, could not be called a very extravagant charge, considering that the traveller and his family had the whole vehicle to themselves. They found a good macadamised road, with new and handsome inns, on the whole line between St Petersburg and Torjok, where they turned aside from the Moscow route, and soon after reached Krasnoe, the hospitable mansion of their friends.

After a residence of three months at this place, Mr Venables paid a visit to another relative at the town of Yaroslav, a place containing twenty-eight thousand inhabitants, and lying about two hundred miles to the north-east of Moscow. Many of the letters of the reverend traveller are dated from Krasnoe and Yaroslav, and they refer chiefly to the rural economy of the country, presenting many interesting particulars respecting the relations between the higher and lower classes. The nobility, we learn, form a most extensive body. Family titles are enjoyed equally by every descendant of a noble house, without any distinction in favour of the eldest branch, and hence the immense number of nobles occasionally found to bear one title and name. "As an instance of this (says Mr Venables), I may observe, that of the name of Galitzin only, there are at present no less than three hundred princes; how many princesses there may be, I do not know, but they, of course, are also very numerous." This renders titles in some respects of little consequence, but, in others, they are of the highest value. "The nobles are free from the conscription, which presses heavily on all other classes. They are in no case liable to the knout and other corporeal punishments; and they can always claim to enter the service, at the least, as under officers, and to receive a commission, or to attain an equivalent rank as civilians, at the farthest in three years, excepting in cases of misconduct." These are valuable privileges, but a much more valuable one is yet to be noticed. None but a noble can possess serfs or bondmen, and, without these, landed property in Russia is of small account. Property here is estimated "not by the annual income of the estate, but by the number of souls, that is, of male peasants, which it contains, for the fair sex is never counted in the census." A Russian proprietor talks always of possessing *souls*, and many proprietors have truly an immense number of them. Count Cheremetieff, the largest land-proprietor in the country, has not less, it is computed, than one hundred and ten thousand souls on his estates, counting the males only under that denomination.

"The footing," says Mr Venables, "on which the agricultural serf practically stands towards his master, is, in most respects, that of a small tenant; the principal difference being that he cannot change his employment, or move from home, without his master's leave, which is sometimes obtained for a certain annual sum, called *obrok*, in lieu of service. As a general rule, he has a house and a portion of land, for which he pays rent in labour instead of money. He works three days in the week for his master, and has the remainder of his time at his own disposal. A day's labour of a man includes that of his wife and his horse when requisite. * * * The peasant cannot be legally sold or transferred from one master to another, excepting with the whole of his family; but this law is often broken or evaded." In some points, these relations between serf and master are not of an illiberal kind; and though "grossly ignorant," and a slave, the Russian peasant seems in general contented and happy. His severest trials, according to our author, arise from the conscription—married men, or the sons of widows, or aged parents, being often mercilessly torn away from families of which they were the chief prop and stay.

The reverend author of the volume before us con-

* Murray, London.

firm the statements of others, who have represented the system of government in Russia as essentially military. A martinet-like strictness pervades all the arrangements for insuring order and peace in the country. The fire-establishments give an example of this. "The fire-establishments (says Mr Venables) here are not, as in England, in the hands of insurance companies, but under the immediate control of government. The firemen are soldiers, and the horses, engines, &c., are the property of the crown; the whole, however, appears to be well organised, and the general regulations laid down by law, to be extremely good. In the towns, watchmen are stationed day and night on the tops of high towers, which are built in various quarters, so as to command the town; at the foot of each tower is an establishment of firemen, horses, and engines, which are or ought to be always ready at a moment's notice.

As soon as the watchman on the tower discovers a fire, he rings a bell, which gives the alarm to the firemen below, while at the same time, by a telegraph, which can be used either by day or night, there being in the latter case a certain arrangement of lanterns, he points out the direction of the fire, and warns the establishments in other quarters of the town to send their assistance. As soon as the train of engines is ready, it proceeds at full speed through the streets, neither stopping nor turning aside, being preceded by a horseman, who gallops along, shouting and warning all persons to clear the way. If it is dark, the leading engine carries a bright light high up on a pole, which is easily distinguished, by its position, from the lamps of a carriage as it moves along.

In the villages, where the rules are carried into effect, every house has a small board affixed to it, on which is painted a number, and under the number is a figure of some implement useful at a fire: on one is drawn a bucket, on another an axe, on a third a ladder or a pole with a hook at the end for pulling down burning thatch and rafters. The moment a fire is discovered in the village, the inhabitant of every house is bound to appear with the implement depicted outside his door; and there are various regulations for establishing order in the operations, such as the appointing one man out of a certain number to be the captain of the gang, and to direct their proceedings."

From Yaroslav, Mr Venables set out in October for Moscow, where he remained some time on his way to Tamboff, a town about three hundred and eighty miles to the south of Moscow. At Tamboff he spent the winter, and in March returned to St Petersburg, on the homeward route. The reverend traveller had thus an opportunity of observing the country both extensively and closely, and he communicates much valuable information on the local governments, on the manners and customs of the people, and on other points of serious interest. In place of following him, however, into the details of these matters, we prefer to introduce to our readers some of the lighter and anecdotal passages with which Mr Venables' work is largely and pleasingly interspersed. Masquerades, it appears, are common at Christmas in Russia, and it is not unusual for private families on these occasions to throw open their houses for the admission of all masks who may choose to come. This custom led to a strange occurrence in the winter of 1834, which our author thus describes:—"A ball was given, at the period mentioned, in a house at St Petersburg, and the ordinary signal (of placing candles in the windows) was displayed for the admission of masks, several of whom arrived in the course of the evening, staid a short time as usual, and departed. At length a party entered, dressed as Chinese, and bearing on a palanquin a person whom they called their chief, saying that it was his fete-day. They set him down very respectfully in the middle of the room, and commenced dancing what they said was their national dance around him. When this was concluded, they separated, and mingled with the general company, speaking French very well, and making themselves extremely agreeable. After a while, they gradually began to disappear unnoticed, slipping out of the room one or two at a time, till at last they were all gone, leaving their chief sitting motionless in dignified silence in his palanquin in the middle of the room. The ball began to thin, and the attention of those who remained was wholly drawn to the grave figure of the Chinese mask.

The master of the house at length went up to him, and told him that his companions were all gone, politely begging him to take off his mask, that he and his guests might know to whom they were indebted for the pleasure which the exhibition had afforded them. The Chinese, however, gave no reply by word or sign, and a feeling of uneasy curiosity gradually drew around him the guests who remained in the ball-room. The silent figure still took no notice of all that was passing around him, and the master of the house at length with his own hand took off the mask, and discovered to the horrified bystanders the face of a corpse!" The police, who were sent for on the instant, never got any clue to the actors in this transaction. Surgical examination showed the man to have been almost newly strangled. The masked dancers came, it was found from the servants, in a handsome carriage with the body which they thus strangely threw off their hands.

Mr Venables tells some lively stories regarding Russian field-sports, or rather regarding the means taken to extirpate those serious pests of the country, wolves and bears. "Every one (says he) has heard of

the mode of catching these animals in pitfalls, by placing a lamb or a pig as a bait, on the top of a post rising out of the pit: they have in Russia a kind of trap, which is exceedingly simple, but which I never heard of before I came into the country. A small circle is inclosed with a palisade or some other fence, too high for a wolf to leap or climb over; this fence is again surrounded by another of the same kind, leaving a narrow space between the two: the outer fence has a door, which opens inwards, so as to fill up the space between the two palisades when it is set open. A lamb or a pig is placed at night in the inner circle, and being alone and cold, it naturally bleats, or grunts and squeals; the noise attracts the wolf, who enters the door which is open, and finding the inner fence still between him and his prey, prowls round it in hopes of discovering an opening. When he arrives at the door, having made the circuit of the place, he pushes against it, and thus shuts it, and imprisons himself; for the space in which he is, being narrow, and his back-bone very inflexible, he cannot turn, and the door is of course so hung as to shut from a very light pressure.

You have heard of the plan of shooting wolves on a moonlight night in winter, when two or three sportsmen place themselves, well armed, in a sledge, and are driven through the roads and tracks in the woods. As they go along, they pull the ears of a young pig which they take with them, and make it squeal, while behind the sledge trails a long rope, with a wisp of straw at the end of it. The wolf hears the pig squeal, and seeing the bundle of straw dancing along over the snow in the moonlight, makes a dash at it, mistaking it for his prey, and thus presents a fair mark to the guns in the sledge. This sport, like all others, has its vicissitudes; sometimes the disappointment is incurred of a blank night, and sometimes, on the other hand, too much game is started, and the amusement becomes somewhat dangerous. If the sportsmen have not time to pick up the wolves they kill, the others tear the bodies of their dead companions, and, becoming furious, will attack the sledges. A gentleman who lives near here, and whom we often see, met with an adventure of this kind some time ago, and after making his pig squeal for some hours in vain, at length unexpectedly attracted such a troop of wolves, that he was obliged to fly for safety and trust to his horse's heels, and he was pursued by twelve or fourteen of the beasts even into the village."

Before closing our notice of the very meritorious work to which we have been indebted for these extracts, it is proper to observe, that some concluding remarks are given on Russian husbandry, from the pen of M. de Sabouloff, a gentleman practically versant with the subject. For some readers this portion of the work may be possessed of much interest.

SUSPENSION-BRIDGES.

It is a curious circumstance, that suspension-bridges, to which modern architecture has resorted as an improvement, in certain situations, upon the more common form of bridge-building, should in reality be an invention of savage life, and not the product of the advance of science. The earliest suspension-bridges of which we have any account, are those of China, reported to be of great extent and much ingenuity of structure. No particular description, however, of these Chinese bridges, has been obtained. But in South America, structures in some respects similar are found in many quarters, and these may justly be held as exhibiting bridges of suspension in their simplest and primitive form. Baron Humboldt gives a description of one seen by him near Penipe in South America. It was formed of a peculiar species of ropes, which were made from the fibrous roots of the American Agave, and were three or four inches in diameter. These ropes were attached at each side of the river to a rude scaffolding of trees, composed principally of two strong upright posts, strengthened below by smaller supports. Passing across from the two posts on one side to the two on the other, the ropes formed a pathway about eight feet broad, laid with small round pieces of bamboo, placed transversely. One strong rope constituted the balustrade on each side, being about three feet above the pathway, and joined to it by upright sticks. As the weight of the bridge would pull the scaffolding inwards and downwards to the river, the structure was kept in place by ropes passing outwards, or landwards, from the upright posts to the ground. As the bridgeway was of considerable height, these ropes ran to the ground at a sharp inclination, and thus the bridge had to be ascended by a kind of ladder or stairs. This rope-bridge was one hundred and twenty-seven feet long. There is great peril, according to the accounts of travellers, in passing such bridges, which look like ribbons suspended over an impetuous torrent or deep ravine. Baron Humboldt says, nevertheless, that "the danger is not very great, when a single person crosses over by himself, especially if he runs as quickly as possible, throwing the body forward. But the oscillations of the ropes become very violent when the traveller is conducted by an Indian, who walks much quicker than he; or if, affrighted by the appearance of the water, seen through the interstices of the bamboos, he is imprudent enough to stop in the middle, and lay hold of the ropes which serve for balustrades." Some of the South American rope-bridges are strong enough to permit loaded mules to pass over them. But, in ge-

neral, these structures go rapidly to decay, and require new ropes to be substituted for some of the old ones every eight or ten years. As the natives are by no means punctual in attending to these points, the rope-bridges have often holes in them, which are large enough to precipitate the unwary traveller into the abyss beneath.

Such is the primitive form of those structures, which the aids of science and art have moulded into so elegant and beautiful a shape in Britain and other civilised countries. In what instance chains were first used in making suspension-bridges, may be difficult to determine. The natives of Hindostan appear to have formed suspension-bridges of great beauty and strength, by means, not of rough ropes, but of cane, with iron bolts and fastenings in some parts of the structure. Major Rennel describes one bridge (chiefly made of cane) over the Sampoo in Hindostan, of about 600 feet in length. Turner, also, in his voyage to Thibet, gives the plan of a bridge in that country, which is 140 feet long, and which is supported by five chains, covered with pieces of bamboo. The first chain-bridge constructed in Britain is believed to have been the Winch-Bridge over the river Tees, erected about the year 1740, and forming a communication between the counties of Durham and York. A description of this bridge is given as follows in Hutchinson's Antiquities of Durham:—"About two miles above Middleton, where the river (Tees) falls in repeated cascades, a bridge, suspended on iron-chains, is stretched from rock to rock, over a chasm near sixty feet deep, for the passage of travellers, but particularly of miners. The bridge is seventy feet in length, and little more than two feet broad, with a hand-rail on one side, and planked in such a manner that the traveller experiences all the tremulous motion of the chain, and sees himself suspended over a roaring gulf, on an agitated and restless gangway, to which few strangers dare trust themselves."

More than half a century passed away after the erection of the Winch-Bridge over the Tees, ere any other structures of the same kind were attempted in Britain. Previously to 1811, however, eight chain-bridges had been constructed in the United States by the enterprising people of that country. One of these, over the river Merrimack, in Massachusetts, had an arch of 244 feet span, and two carriage-ways, each fifteen feet broad. This bridge was capable of supporting five hundred tons, and was finished in 1809. Leaving out of sight various works which were projected (and some of them commenced) but not completed shortly after the year mentioned, the second suspension-bridge finished in Britain was one over the river Gala, close by the town of Galashiels. The person who had the merit of projecting this bridge, the first ever constructed in Scotland, was Mr Richard Lees, an extensive woollen-cloth manufacturer of Galashiels, whose works were situated on both sides of the Gala, and who therefore conceived the idea of making a convenient communication between the different parts of his works. At an expense of £40, he got a foot-bridge formed in 1816, of slender iron-wires, and one hundred and eleven feet in length. It was commonly and properly termed a wire-bridge, and was the first structure of that kind ever seen in Britain. Though very slight, as may be guessed from its petty cost, it has endured well the action of time, and is still passable and useful. It shakes or oscillates very considerably, but yet not so much as to be alarming, or even disagreeable. In 1817, the year following the erection of Mr Lees's bridge, the late Sir John Hay, Bart. of Hayston, erected another wire-bridge over the Tweed, about a mile and a half below the town of Peebles, in order to join his two properties of Kingsmeadows and Eshiels. This bridge is one hundred and ten feet in length, and the footway four feet in breadth. It cost £1,160, and is consequently a much more solid and steady structure than that over the Gala. Four strong hollow tubes of cast-iron, two at each end of the bridge, are erected four feet apart, and from each of these hollow posts a series of wires, three tenths of an inch in diameter, stretch out at various inclinations to the road-way, and sustain it. This bridge, when first erected, was crowded with people, without showing any signs of weakness. A slight spring and tremor are all that can be observed in passing over it. It is solely a foot-bridge. From its extremely romantic situation on the Tweed, from the beauty of the walks, shrubbery, and little ornamented cottage beside it, as well as from the fine general appearance of the country around, this bridge is rendered one of the most picturesque spectacles which the admirer of beautiful scenery can visit or behold. Another wire-bridge was erected shortly after the preceding one, over the Ettrick, at Thirlstane Castle, by the late Lord Napier. It measures about 125 feet span, and was suspended by wires in the same way as the Kingsmeadows bridge, as well as the Galashiels one.

Mr Stevenson, civil engineer, who has an excellent account of Scottish suspension-bridges in the Philosophical Journal, describes the Dryburgh suspension-bridge as the first erected on the Tweed (and indeed in Scotland) upon catenarian principles; that is to say, where chains were the instruments of suspension. It was first built upon the same plan as the Kingsmeadows one, chains only being substituted for the wires radiating from the end posts or hollow tubes described. But, on the 15th of January 1818, after the bridge, which measured 260 feet across, had been on the Dryburgh ferry for about six months, "a most

violent gale of wind took place (says Mr Stevenson), when the vibrating motion was so great, that the lowest radiating chains were broken, the platform blown down; and the bridge completely destroyed. A number of persons who saw the accident concurred in stating, that the vertical motion of the roadway of the bridge, before its fall, would have pitched or thrown a person walking along it into the river." This bridge had been erected at an expense of £500, and had proved so extremely useful, being constructed for foot passengers and led horses, that Lord Buchan decided at once upon reconstructing it, which was accordingly done, at an additional expense of £220. The construction of the new bridge is as follows:—Four posts (two at each end), consisting of strong Memel logs, form the points over which the suspensory chains pass, to sustain the bridge on the one side, and on the other to be fixed firmly in the ground. The chains of one side meet the corresponding chains of the opposite side in the centre of the bridge, having inclined downwards from the top of the posts (twenty-eight feet high) to the level of the top of the side-rails or balustrade. Numerous perpendicular rods of iron descend from these great chains at regular distances, and sustain the roadway. This suspension of the roadway by upright rods from large chains, is called the catenarian principle. The roadway of the Dryburgh chain-bridge is nine feet wide at the ends, but converges towards the centre, until it is diminished to a width of four feet and a half. It is now an extremely steady, strong, and serviceable bridge.

Another chain-bridge, of a more grand and bold design, was built across the Tweed at Norham ford, five miles from Berwick, in the years 1819–20. Every thing about this bridge, which is called the (Berwick) Union Chain-bridge, is on a great scale. Its span is 361 feet, its roadway 18 feet broad, and its cost was £6050. It has three chains on each side, passing between the points of suspension on the two banks of the river. These six suspensory chains (or rather twelve, as the half is usually called one chain) pass, on the Scottish side, over pillars of asier masonry, measuring sixty feet in height, and on the other side are fixed into a tower of masonry, built on a precipitous bank, and twenty feet in height. From these parallel ranges of suspensory chains, perpendicular rods depend at regular distances, and support the roadway, which is made of timber, with iron cart-tracks laid for the carriage wheels. The weight of the whole bridge, between the points of suspension, is estimated at 100 tons. One main chain, from side to side, alone weighs 10 tons.

This chain-bridge, which is light and elegant in appearance, was the first bridge of the kind in Great Britain, calculated for the passage of loaded carriages. Its successful completion and subsequent utility gave a great stimulus to the erection of suspension-bridges in other parts of Britain. The Menai bridge, or that over the straits dividing the Isle of Anglesea from Caernarvonshire, was finished after this period. It is of the length of 560 feet between the points of suspension, and so much elevated above the surface of the water, that vessels of considerable size can pass under it. After these first suspension-bridges were erected, a new plan was hit upon, of passing the supporting chains below the roadway, instead of placing them above, and suspending the roadway from them. For example, the suspension-bridge across the river Kelvin, near Glasgow, was constructed after this fashion. This bridge was sixty-three feet in span, and had a roadway twelve feet wide, which rested, by means of cast-iron brackets, on the row of chains or rods passing under it from the abutment of one side to that of the other.

Whether the chains are placed above or below, seems to be of little consequence, and experience has in fact proved that safe and excellent bridges may be made both ways, for of late years many additions have been made to the list already noticed, some being upon one principle, and some on the other. We do not, however, propose to carry our notice of this subject any farther here, satisfied with having pointed out the cases which have an interest attached to them, from being the first attempts at suspension-bridge building in this country. Under particular circumstances, certainly, this species of bridge appears to have decided advantages. Cheapness is in itself an advantage not to be despised. It was calculated that a stone-bridge over the Tweed at Norham would have cost four times the sum expended on the chain-bridge. Time, however, has yet in some measure to prove whether the durability of iron suspension-bridges is at all comparable to the lasting character of those made of stone.

ANECDOTE OF NAPOLEON.

After having gained the battle of Wagram, the Emperor Napoleon established his head-quarters for a time at Schoenbrunn, and there occupied himself, pending the negotiations for his Austrian alliance, with reviewing his troops, and distributing among them rewards and honours. One old and brave regiment of the line was drawn out before him for this purpose, his custom being to examine every corps individually, under the guidance of the officers. After having formed the regiment into columns, Napoleon entered among the ranks, and bestowed praises and decorations on all who appeared worthy of them. Five hours he spent on this occupation, and at length, when he had satisfied himself that no one man's claims had been overlooked, he finished by saying aloud to the

colonel, "Now present to me the bravest soldier in your whole regiment." In some cases this might have been a difficult matter; it did not appear so now. The colonel, indeed, hesitated for a moment, but the question was caught by the soldiers, and one universal answer came from the ranks. "Morio! Corporal Morio!" was the cry. The colonel approved of the decision, and Morio was called forward. He was a man still young, but embrowned by service, and he already wore on his person three badges of merit, and the cross of the Legion of Honour. Napoleon looked at him attentively. "Ah," said he, "you have seen service?" "Fifteen years, my emperor," replied Morio; "sixteen campaigns and ten wounds—not to speak of contusions." "How many great battles?" asked the emperor. "Sire, I was at your heels at the Bridge of Arcola; I was the first man who entered Alexandria; it was I who gave you my knapsack for your pillow at the bivouac of Ulm, when forty thousand Austrians capitulated; I took five hussars prisoners with my own hands on the day of Austerlitz; it was I who served you —." "Hold! it is well, very well! Morio, I name you baron of the empire, and to that title I add a hereditary gift of five thousand francs a-year." Acclamations rose anew from the soldiery. "Ah, my emperor," said Morio, "this is too great a reward for me. But I will not play the usurer with your bounty. None of my companions, while I have it, shall want food or clothing."

Morio still lives. He only quitted the service when his master fell, and, in spite of that change, Morio still enjoys the emperor's gift. He has kept his word to his companions. No old soldier in the department to which he has retired, wants wherewithal to drink the health of Napoleon.—*French newspaper.*

THE POOR MAN'S SONG.

[FROM UHLAND.]

A poor man, poorer none, am I,
And walk the world alone,
Yet do I call a spirit free,
And cheerful heart my own.
A gleesome child I play'd about
My dear, dear parents' hearth,
But grief has fallen upon my path,
Since they are laid in earth.
I see rich gardens round me bloom,
I see the golden grain,
My path is bare and barren all,
And trod with toil and pain.
And yet, though sick at heart, I'll stand
Where happy faces throng,
And wish good-morrow heartily
To all that pass along.
A bounteous God! Thou leav'st me not
To comfortless despair;
There comes a gentle balm from heaven
For every child of care.
Still in each dell thy sacred house
Points mutely to the sky,
The organ and the choral song
Arrest each passer by.
Still shine the sun, the moon, the stars,
With blessing even on me,
And, when the evening bell rings out,
Then, Lord, I speak with thee.
One day shall to the good disclose
Thy halls of joy and rest,
Then in my wedding robes even I
Shall seat me as thy guest.

[The above has already appeared in a newspaper.]

SCRAPS FROM AMERICAN NEWSPAPERS, AS COLLECTED IN THE NEW YORK MIRROR.

SALE OF A CITY.

We learn from the Arkansas Times that "the city of Rockroe was sold a few days ago for taxes." We are not informed whether the inhabitants were thrown into the bargain.

RECIPE FOR THE FEVER AND AGUE.

As soon as the ice is out of the river, buy yourself an old skiff, take part in a seine, and go a-fishing on shares. Stand half-leg deep in the water for six weeks in succession, with two inches cat-fish slime on your trousers, and bathe the inside with new whisky, to keep it from striking to your stomach. Put up a couple of barrels of cat-fish for family's use—slight sprinkling of salt, plenty of Maumee water—that's pretty strong, especially at this season of the year. Take plenty of fresh air, especially at nights; and if you can't get to sleep in the big government-purchase, take a sleeping apartment with only two sides, and neither top nor bottom. By and bye the cat-fish begin to show their strength—a sprinkling more salt, plenty more Maumee water—strong smell's very healthy. Eat plenty of cat-fish broth, and go a-coonin' a nights for exercise. Weather begins to grow hot; good plan to get asleep under the shade of a tree, and let the sun come round and catch you at it. Eyes begin to look yellow; mouth tastes bad; Maumee water don't sit well; tongue furred; fever; doctor; drugs; and so on. Get better; more cat-fish broth, mixture of green-corn, buttermilk and plenty of new whisky. Bowels out of order; physic out with muskmelons; begin to feel scaly; heels running out to seed; clothes grow too large; body sharpened out, and almost ready to drive down; take more buttermilk, and lie down on the sunny side of a haystack, and, in half an hour, shake like a lamb's tail. Proper bad country!

MISCONCEPTION.

As a canal boat was passing under a bridge, the captain gave the usual warning, "Look out!" when a little Frenchman, who was in the cabin, obeyed the order by popping his head out of the window, which received a severe thump by coming in contact with a pillar of the bridge. He drew it back in a great pet, and exclaimed, "Deese Americans say look out when dey means look in."

THE BITER BITTEN.

A man in the dress of a workman was lately walking in the streets of Berlin with a packet in his hand, sealed with five seals, and inscribed with an address, and a note that it contained one hundred thalers in treasury bills. As the bearer appeared to be at a loss, he was accosted by a passenger, who asked him what he was looking for. The simple countryman placed the packet in the inquirer's hands, and requested that he would read the address. The reply was made as with an agreeable surprise. "Why! this letter is for me: I have been expecting it for a long while!" The messenger upon this demanded ten thalers for the carriage of the packet, which was readily paid, with a liberal addition to the porter. The new possessor of the packet hastened to an obscure corner to examine his prize, but, on breaking the seals, found nothing but a few sheets of blank paper, on which was written "Done."

POWER.

The powerful will always be unjust and vindictive. M. de Vendome said pleasantly on this subject, that when the troops were on the march, he had examined the quarrels between the mules and their drivers, and that, to the shame of humanity, reason was almost always on the side of the mules. M. Duverney, so learned in natural history, knew by the inspection of the tooth of an animal if he was carnivorous or granivorous. He used to say, "Show me the tooth of an unknown animal, and I will judge of his habits." By his example, a moral philosopher could say, "Mark to me the degree of power with which a man is clothed, and by that power I shall judge of his quality."

LEGAL ELOQUENCE.

A young backwoods lawyer lately concluded his argument in a case of *quare clausum fregit*, with the following sublime burst:—"If, gentlemen of the jury, the defendant's hogs are permitted to roam at large over the fair fields of my client, with impunity and without pokes—then—yes, then, indeed, have our forefathers fought, and bled, and died, in vain!"

A BACKWOODS HEROINE.

A correspondent of the Louisville Journal says, "Last week, a Mrs MacBride, of Monroe county, a widow lady, was informed by one of her children that the dogs had treed a panther within half a mile of the house. Having no ammunition, she sent to a neighbour's and procured powder and lead, moulded some bullets, loaded her gun, and proceeded to the place, and brought down her game at the first fire. The report of the gun started up another panther near at hand, which ran up a tree within half a mile of the other. She again loaded her gun and killed the second also at the first fire, on the top of one of the tallest trees. What would your city ladies say to this? I happened to be there the same day, and received the statement from herself."

ALL IN ALL.

In the west there is a man who is a chaste writer, an eloquent preacher, an honest pedlar, a first-rate fiddler, and above all a good man. He had better visit old Connecticut and reform the people there, and then come this way.

UNIVERSAL EQUALITY OF MAN.

There is but one way of securing universal equality to man; and that is, to regard every honest employment as honourable, and then for every man to learn, in whatever state he may be, therewith to be content, and to fulfil, with strict fidelity, the duties of his station, and to make every condition a post of honour.

A MISTAKE CORRECTED.

An orator holding forth in favour of "woman, dear divine woman," concludes thus:—"Oh, my hearers, depend upon it nothing beats a good wife." "I beg your pardon," replied one of his auditors; "a bad husband does."

YOUNG MEN BEWARE.

We heard of an old gentleman once who had three daughters, all of whom were marriageable. A young fellow went a-wooing the youngest, and finally got her consent to take him "for better or for worse." Upon application to the old fellow for his consent, he flew into a violent rage, declaring that no man should "pick his daughters in that way," and if he wished to get into his family, he might marry the oldest, or leave the house forthwith.

LOGIC.

A clergyman once undertook to convert a negro, who was all but incorrigible. As an *argumentum ad hominem*, he told Cuffy that the wicked did not live half their days. "Dat dare is queer," said Cuffy; "him no lib out half him day, hah. Well, den, I 'spose him die 'bout 'leben o'clock forenoon!"

A FRIENDLY INTIMATION.

The boards of a tavern in Georgia were annoyed by flies in their butter. Judge Dooly took the tavern-keeper aside, and remarked to him, in a private way, that some of his friends thought it would be best for him to put the butter on one plate and the flies on another, and let the people mix them to suit themselves. He merely suggested it for consideration.

FRENCH POLICE.

So strict an eye is kept over the movements of foreigners in France, that an American, having lately forgotten his lodgings, was obliged to go to the police-office to obtain the necessary information, when, to his great surprise, he was told who he was, where he lodged, and where he had taken dinner.

A MISTAKE.

A doctor, on calling upon a gentleman who had been some time ailing, put a fee into the patient's hand, and took the medicine himself which he had prepared for the sick man; he was not made sensible of his error till he found himself getting ill, and the patient getting better.

FIGURES OF ARITHMETIC VERSUS FIGURES OF SPEECH.

AMONGST all the changes going on amongst us, there is none of a more remarkable nature than the disposition everywhere visible to substitute the figures of arithmetic for the figures of speech. Formerly men talked and declaimed: now they reckon. And not only are numerical summations resorted to in matters which readily fall under the law of numbers, such as the exports and imports of a country, or the progressive increase of its inhabitants, but also for the solving of many questions which, at no distant date, were looked upon as of too vague a nature ever to be the subject of more than general or superficial observation. Questions of the nature we allude to used to be, and still are to a certain extent, excellent themes for orators—men who appeal to feelings and fancies, and in general have a dislike to facts, as only tending to mar their eloquence. For an example—The condition of the young people employed in factories was, a few years ago, the subject of many pathetic statements in the House of Commons and elsewhere, from which it was made to appear, that, through the severity of their labours, they were deprived of nature's fair proportions, and ushered into mature life (when they survived so far) a miserably stunted race of beings, threatening to produce a wide-spread degeneracy. As long as figures of speech had been permitted to reign, these statements would have passed current, and the public mind would have received them as truth. But what said figures of arithmetic! When the royal commissioners, appointed for the purpose, began to inquire into the real state of the case, instead of contenting themselves with a mere ocular survey of the factory children, they resolved to subject them to a test which could not err. They resolved to *weigh and measure* them. They took factory boys and girls from various places, the former to the number of 410, and the latter 652, and a large but lesser number of children of both sexes not employed in factories; and, on weighing and measuring the one against the other, they found that there was scarcely any difference in either respect between the two sets of children. We need not give the formal table in which the weights and sizes at different ages are set down, but we shall present the general result. The average weight of a number of boys and girls employed in factories between the ages of nine and seventeen, was for the former 75.175 pounds, for the latter 74.739: the average weight of an equal number of boys and girls of the same ages, not labouring in factories, was for the former 78.680, the latter 75.049. The average stature in inches of a number of factory boys and girls was, respectively, 55.282 and 54.951, while the average stature of an equal number of non-factory children at the same ages, was, respectively, 55.563 and 54.971. The non-factory boys were thus the heavier by less than a twentieth, and taller by about a hundredth; while the factory and non-factory girls were almost identical in both size and weight. Perhaps more extensive inquiries are wanting to give complete satisfaction on this question; but, in the mean time, enough has been done to show that the outcry as to the effects of factory labour in stunting the human frame in youth, is founded on pure surmise, and not worthy of being listened to for a moment.

Amongst the common notions respecting a manufacturing as contrasted with an agricultural population, no one is more universally prevalent, or more readily received, than that the former are much more addicted to crime than the latter. When figures are resorted to, the very reverse appears to be the truth. In 1830, the proportion of thieves in the county of Edinburgh, a rural district containing a large non-manufacturing city, was as 1 to 1462 of the population, while the proportion in the manufacturing counties of Lanark and Renfrew was as only 1 in 2097. In non-manufacturing Sweden, the proportion of criminals is

as five to one of what it is in manufacturing England. Another prevalent notion respecting crime is, that want is its chief prompting cause. This is also an error. Of a thousand criminals confined in Preston jail between October 1832 and July 1837, and into whose cases the chaplain made the most minute investigations, "want and distress" were alleged to be the prompting causes of the offence, even by the parties themselves, in only 76 instances. It may be added that "idleness and bad company" were the causes in 88 instances, and "drunkenness" in no fewer than 455, or nearly a half of the whole. The prevalent notion as to the large share which drunkenness has in causing crime, is thus supported by good evidence.

To what extent the interests and comfort of a working man are affected by his having wife and children, is obviously a question of great importance. The working man, like all others, is naturally anxious to marry, and, to encourage himself in taking that step, or cheer himself when, the step being taken, a family is increasing upon him, he is apt to repeat an ancient popular maxim, that mouths are never sent without meat being sent also. To a certain extent, this maxim is true, for, one way or another, most children find food. But the personal well-being of a working man may nevertheless be greatly affected by a multiplication of food-demanding mouths; and it is worth while to inquire whether it is so in general, and how far. A few years ago, Dr James Phillips Kay, an assistant poor-law commissioner, ascertained the particulars of the incomes of 539 agricultural labourers in the counties of Suffolk and Norfolk, which he presented to the public in the form of a set of tables, several of which we have given in a subsequent page.* It appears, from these, that an agricultural labourer in Suffolk or Norfolk, while doubling all his expenses (as we must presume) by taking a wife, advances his income by marrying to the extent of only five pounds, or a fifth of what he enjoyed as a bachelor; the larger half of the additional sum being the produce of the wife's own labour. With three little children added to the burden, he has two pounds more, or about thirteen and sixpence per month. With four children, one of them above ten, the addition to the income which he had as a married man without children, is rather less than five pounds, or twenty-five shillings for each mouth. In the later stages of the progress of his family, he is a little better off; but still the utmost average he ever derives from the labour of a wife or child is in the one case L.2, 12s. 7d., and in the other L.1, 17s. 1d., neither of which sums is sufficient to support the respective individuals by whom they are gained. Clearly, he must sacrifice a large proportion of that which he can earn as a single man, in order to surround himself with the comforts of a family.

Another question bearing strongly on the above—namely, how many of the children of the labouring classes die through insufficient comfort and attendance—remains in obscurity: it is one well worthy the attention of statisticians. A law, throwing much light on this subject, has lately been ascertained by a foreign inquirer, Mr Woronzow Gregg. It is, that the fewer marriages in proportion to the population, there are the more children to each marriage. In Limbourg, where there is one marriage every year for 90 of the population, the average number of children to a marriage is 3. In East Flanders, where there is one for 165 of the population, the number of children to each marriage is between five and six. In those parts of France, where the proportion of annual marriages is as 1 to every 112, the children are 2½: in those where it is as 1 to 160, the children are 4½. Similar results have been obtained in England. There can be no other reason for this law than that, where marriages

are few in proportion, there must be a superior prudence, ensuring better provision for the consequences of marriage.

Other examples of vague assertions, long current, but now refuted by numerical inquiries, may be adverted to. It was long believed that consumption (phthisis pulmonalis) was more prevalent in cold than in warm climates; but of late it has been ascertained that, of the troops serving in the West Indies, 12 in the thousand are attacked annually by this complaint, while of the dragoon guards and dragoons serving in England, only 5½ in the thousand become its victims. There is also a prevalent notion that the operation of lithotomy is more frequently attended by loss of life than that of amputation. Some inquiries of a numerical kind made of late in both hospital and private practice, throughout England, France, Germany, and the United States, give different conclusions. In 640 cases of amputation, the deaths were 150, being considerably higher than the proportion in cases of lithotomy—which, however, we are unable to state. It is to be remarked, that, in cases of lithotomy, the surgeon usually can choose his time, which he cannot so often do in the other class of cases; and that where amputation is resorted to, there are often other causes for death besides the mere exhaustion produced by the operation, or the accidents which may attend it. The comparative mortality of children born in cities and those born in the country, would probably be stated at a high disproportion by most persons; yet the difference does not appear to be great. M. Quelet, the Belgian statistician, has shown that of 10,000 male children born in cities in his country, the deaths during the first year amount to 2574; while of an equal number born in the country, the deaths in the same space of time are 2425, a difference of only a sixteenth. Amongst female children he found the difference to be considerably less. This gentleman has announced the startling fact, that one-tenth of the infants which enter the world die in the first month, and nearly one-fourth in the first year.

We had lately occasion to show* that while nothing could be more uncertain than the life of any individual, it was possible, when a great number were taken together, to say with almost perfect certainty how many, in certain given circumstances, would die in the first year thereafter, how many in the second, and so on. There are many other things which, in single instances, are liable to as great uncertainty, but in a large aggregate show that they are governed by laws of fixed regularity. It would be quite impossible, for example, to say which man out of any nation was likely, in the course of the ensuing twelvemonth, to commit murder with a knife. Yet the murders committed in this manner in France are wonderfully near the same amount every year, being in the six years from 1826 to 1831, respectively 39, 40, 34, 46, 44, 34. Again, it would be quite impossible to say which man or woman was likely, in the course of the next year, to commit suicide; yet the number of suicides actually committed is nearly the same each year. In the department of the Seine in France, it was, in the nine years from 1817 to 1825, respectively 352, 330, 376, 325, 340, 317, 390, 371, 396. There was even an uniformity, each year, in the numbers of those who killed themselves by drowning, by fire-arms, by hanging, and all the other modes. In all other accidental things, whenever we pass from individuals to masses, or from short to long spaces of time, we find similar uniformity of results, showing a fixity in the causes. A late writer says, very beautifully, on this subject, "Were a man always to examine individual drops of water, he could never conceive the phenomenon of the rainbow; it is only when the drops are aggregated in masses, and placed in a position favourable for observation, that he can contemplate that glorious arch

* We have to request the special attention of the reader to these tables before he proceeds farther. They are extracted from the Journal of the Statistical Society, and are printed on the last page of the present number.

* Article "Life Assurance," in No. 373.

spanning the horizon, and seeming to connect earth with heaven."

The science which makes out these curious results is the science of statistics, one not known by name till the middle of the last century, and which is still in its infancy with us, although in high and well-regulated cultivation on the continent. It is the glorious tendency of this science every where to diminish the regions of the disputable. The disputable being that which occupies most time, thought, and energy, it is of the greatest consequence that its limits should be narrowed, for then there will be the more time, thought, and energy, to devote to the *ascertained*. If we reflect a moment on the things which chiefly occupy human attention, we shall find that they are things on which the demonstrations called for in the exact sciences have not as yet been adduced. Years pass on, and men are still found wrangling on those subjects, each man having only his own vague impressions or prepossessions as grounds for the views he takes, and defending these views, or, as he calls them, opinions, with as much pertinacity, as if they were based on the clearest facts. Silently, day after day, a set of pains-taking men are garnering up arithmetical truths on most of the great subjects of human concernment, and thus preparing the way for a mighty change. In medicine,† in political economy, in the science of our mental nature, in every department of study heretofore only the thome of conjecture, facts are in the course of being stored, which, on the arithmetical principle above described, must in time solve questions now considered the most perplexing. Even the spirit of war and of party must give way before this mighty influence; and where now men meet to shed each other's blood, or to do all they can to thwart each other's measures, Mr Cocker will by and bye come peacefully in, and in a few minutes, by reference to universally acknowledged authorities, settle every dispute.

THE OLD CAMPAIGNER, A STORY.

On the twenty-fifth day of December, in the year one thousand eight hundred and thirty-five, three taps were lightly struck on the fourth-floor door of a house on the Megisserie quay at Paris, one of those tall and ugly turrets that seem to make cross faces down upon the waters of the Seine from morning till night, like so many antiquated and grinning buffoons. The three taps in question caused a young girl, who was seated alone inside of the door to which they were applied, to start rather hurriedly from her seat, and to throw a piece of embroidery on the floor at her feet, believing sincerely, however, that she had put it on the chair beside her. Whether this arose from emotion at the announcement of an unexpected visit, or an expected one, will by and bye appear; but, in the first place, it is necessary to tell who the damsel was, as the reader cannot be expected to take such interest as we could wish in one yet a stranger to him.

Pierre Bertrand, the father of Marie, was a splendid specimen of the old half-pay captain of the empire, such as that personage, or class of personages, became subsequently to the empire's fall. Rude and rough, though warm-hearted; retaining the moustache of the soldier, and all the soldier's habits, among which beer-drinking and smoking held so prominent a place as to swallow

almost half his pension; perpetually grumbling, yet continually jolly; enormously proud of various scars and cuts, and certain relics in the shape of crosses of honour, hacked sabres, and riddled uniforms; spending in telling old campaigning stories, and in playing at dominoes, all the time that was not spent in drinking and smoking: such was Pierre Bertrand, and such was his way of life. For his family, Pierre had, properly speaking, two children, although one only had a just claim of paternity upon him, as far as blood went. But for his having an adopted child, however, the old campaigner might never have had offspring of his own. On the field of battle, a dying comrade had consigned an infant boy to his arms, and Pierre had received the consignment with as much satisfaction and pride as others might receive a legacy of millions. It was to give this child a mother that Pierre had at first thought of marriage; and it chanced that this step, when he took it, only proved the means of bringing upon Pierre another dying legacy, his own little Marie. But the veteran bore up bravely under his burdens, and did his duty nobly by both his charges. To the boy Jules he contrived to give a good education, and, six months before the period of our story—six months, in short, before the three taps at the door—Jules, then precisely twenty-three years of age, had completed a course of legal studies, and had been entered a member of the bar of the Court Royal of Paris.

It was a proud day for the old captain when Jules donned the barrister's black cap and robe. Marie was then eighteen, and as pretty a blue-eyed, merry-faced maiden as could be seen, with a heart warm and open as a sunny sky. Pierre had long settled in his own mind that his two "marmots," as he called them, should be married, and that the union should take place on the day that Jules pleaded his first cause. About the feelings of the parties themselves he had never thought much, and, in truth, they had given him no cause for any uneasiness on this score.

One day, immediately after Jules had passed the legal ordeal, old Bertrand was seated in his lofty but neat domicile, smoking silently and furiously, as he always did during any meditations of special importance, when a letter was brought to him. Letters were rare things with the veteran, and he looked long at the post-mark, which was that of his native province. Opening it finally, he read thus:—"Sir, I hasten to announce to you the demise of M. Joseph Bertrand, your cousin-german, proprietor of the foundry here. He has left a fortune valued at a million of francs. No direct heir presenting himself here on the paternal side, it is presumable that you revert to the sum of 500,000 francs, the half of the whole succession, and which the law destines to that branch of the deceased's relatives. Of course you will take the necessary steps to secure your rights." This epistle bore the signature of a provincial justice of peace, and gave other particulars of the case.

Bertrand was struck dumb for five minutes, and then broke out, by way of thankfulness, into a few of his common conversational phrases, which were composed of some three or four thousand bombs, one or two hundred pieces of cannon, and a proportionate quantity of thunders. "Five hundred thousand francs!" at length cried he; "Marie, my girl! read—read this. Read, my darling! Five hundred thousand francs! Yes, units, tens, hundreds, thousands, tens of thousands, hundreds of thousands! All right, Marie, my girl! Hurrah for the emperor! Hurrah!" All was indeed right—and yet all proved not right in the end. Bertrand, soon after receiving the letter, set out for his native place, concluding that he had but to appear and take possession. But the collateral relations had taken advantage of his absence from the spot, and had prepared unexpected obstacles for him. They had stirred and intrigued most actively, and had bought four or five consciences at some few thousand francs a-piece. In short, it was found that Bertrand could not establish his degree of relationship to the deceased. Certain extracts of birth and baptism, with other indispensable documents, could not be procured, notwithstanding the lengthened researches of the old clerk of the registry, to whom Bertrand gave five thousand francs to prove his titles—which sum, by the bye, in addition to twenty thousand received from the other side, made the affair a very profitable one for the old fox. The necessary documents, however, could not be found, and Pierre returned to Paris totally disheartened, and smoking furiously.

Jules was the receptacle of the veteran's complaints. The young advocate was not slow to pronounce that chicanery and roguery must have been at work, and persuaded Pierre to pursue the matter at law. Within a few months the cause came on before the provincial court of B—. Jules, whose activity and researches had been unwearied, appeared for the first time as a pleader. While the case was going on, Marie Bertrand was in a state of feverish impatience. She knew not the issue on the evening of the 25th day of December 1835. It was then that she heard three taps at the door of her father's dwelling, and started from her seat to open it.

Jules entered. Marie sat down on her chair in silence, after one glance at his countenance, which wore a downcast expression. "You have lost the cause then, Jules?" said she at length. "No, Marie, it is gained; you are rich," was the reply. The damsel raised her eyes in surprise, and exclaimed, "Gained! what then means this—this—" Jules interrupted her. "Marie, I quit Paris this evening, and I come to bid you farewell. You will be wealthy, and happy!

Yes, I go—but you will think of me sometimes, will you not?"

The young girl looked at Jules to see if he spoke seriously, and was stunned to behold his eyes filled with tears. At this moment Bertrand entered. Jules went up to him, and, placing a massive pocket-book in his hands, said, "My kind friend, justice has been done to you; here are five hundred bank-notes, of 1000 francs each—the part of your cousin's heritage which fell to you, and which I received, as authorised by you." Bertrand looked at the papers, which Jules displayed to him; then the veteran looked at Marie, who was struggling to hide her tears; and, finally, he looked at the pale face of Jules. "Why, what is this about?" cried he. "Why do you weep, Marie? Why do I not find you happy and joyful at such a moment? Jules, what have you been saying? Wont you answer me? Marie! Jules! By the thunder, there is something here—Marie, girl, tell me why you weep!"

The veteran's daughter made a desperate effort to compose herself. "He is going away, father," said she; "he departs this evening—he quits us—through pride, perhaps. He loved us while we were poor, and does so no more since we have become rich." After this effort, Marie laid her head on her father's shoulder, and wept more than ever.

"I hope, Jules," said Bertrand, "that you will explain this. May I be shot if I understand a word of what this little whimperer means!" "My father," replied Jules, "I depart this night." "You depart—ah, well—how long will you be away?" was Pierre's answer. "A long time, father," said the young man, "a long time—for ever, perhaps! You have nurtured me, you have given me a place and station in life—I ought to be no more a charge to you! I leave Paris—." "Jules, you are insane!" returned the old soldier. "Quit Paris! and at this moment, above all others, when you have won a cause that will ring in the courts! It is folly, and I don't comprehend it. Besides, it is impossible that you can go away. I have arranged matters otherwise."

Marie gently raised her head, and cast on her father a look so sweet, that Jules felt himself enfeebled by its influence.

"Yes," continued Bertrand, "I have had my plans arranged, and for a long time too. Only, I thought I could bestow on you nought but the pearl; but you shall now have the setting along with it, my lad! It won't do you any harm, will it, to have twenty-five thousand livres a-year to keep you going? Come, it is settled. Embrace him, Marie; I am pleased with him. Come, and let us off directly to the notary!"

"My father, it is impossible!" cried Jules, in accents which proved the struggle he was undergoing. "It is impossible! Already do my friends, the court, all Paris, declare that my labours, my researches, my journeyings, have all been for this money! Oh, Marie! pardon me—I love you! Yes, I love you to idolatry! But were you now to be my wife, all men would point the finger at me, as one who would not take the poor girl, but snatched at the rich heiress—snatched at her, as soon as she had become so, and ere she could have an opportunity of seeing other suitors, more worthy of her condition, at her feet! Oh, why did I gain this cause?"

Jules was proceeding in this passionate strain, when Bertrand, who had in the meantime taken the pocket-book into his hands, brought the young advocate to a pause by thus addressing him. "It is, then, this parcel of papers which renders you so scrupulous, my boy! It is this bundle of stuff," continued he, holding up the pocket-book, "that prevents your wedding my little girl! Ah, well, young man, I admire your delicacy. But I will not be less generous than you!" So speaking, old Pierre turned to the window, which he had previously opened, and, with all the force of a vigorous arm, cast the valuable pocket-book far out into the deep and muddy waters of the Seine!

Bertrand then turned from the window, and showing one single bank-note to the astonished and thunder-struck youth, observed coolly to him, "I have kept but this one thousand francs, you see; it will serve for the expenses of the nuptials; for you will not draw back now, Jules?" He continued in a severe tone—"A few moments ago, my daughter was rich, immensely rich, and you refused her hand—like a madman I must say. She is now poor as yourself, for I know she would have been miserable with riches which she could not share with you. To-morrow you will marry her, if you are a man of honour. If not—but I shall leave you together. Marie will inform me of your reply." Bertrand then left the room, shutting the door behind him with a shock that betokened an angry excitement of mind in the old campaigner. But, after all, the recent loss of fortune seemed not long to trouble the veteran, as, on sitting down soon after to a game of dominoes with a boon companion, the latter declared he had never seen Pierre so merry in all their intercourse, or so given to burst into peals of laughter on the slightest incitement.

Jules was completely staggered by Bertrand's act, but, when left alone with Marie, he soon recovered. The sensibility of the young advocate to the public voice was no affected sentiment, nor was his love for Marie; and the pair speedily pledged themselves to each other, hand and heart. They sat long together, yet Bertrand considerably staid out of the way, and ere he returned, Jules had departed. It would be peering too curiously, perhaps, into poor weak human nature, to ask if Jules did not cast a self-reproachful glance into the Seine that night as he passed it on his way homewards. If he did

* Foreign Quarterly Review, xvi. 212.

† "Nothing can be more variable or worse defined than the meaning of the words which have been hitherto employed by the physician in his description of disease, or in his statement of the results of the treatment he has adopted. What meaning are we to attach to such vague terms as 'sometimes,' 'occasionally,' 'generally,' 'in the majority of cases?' These terms, as every one knows, have every possible signification, and vary in their meaning with the varying disposition, and more or less sanguine character of those who use them. The 'sometimes' of the cautious is the 'often' of the sanguine, the 'always' of the empiric, and the 'never' of the sceptic; but the numbers 1, 10, 100, 1000, have but one meaning for all mankind. If, then, for no other reason than the attainment of accuracy, the numerical method ought to be employed wherever it can be possibly be applied."

* * If we consider the health of large masses of men placed under different circumstances, and acted on by different influences, it is to the numerical method that we must look for accurate information as to the effect of these circumstances. If we would compare one human body with another in respect of stature, weight, muscular force, or the development of its several parts, we must also resort to the numerical method. If, again, we direct attention to the several functions performed by the human body in a state of health, we find that most of them can only be adequately described by the aid of numbers. Thus the amount of the ingesta and egesta, the quantity of the several secretions, the products of the respiratory process, the frequency of the pulse and respiration—none of these can be expressed without the aid of numbers. If from the state of the body in health we pass to a consideration of its diseased conditions, we meet with the same necessity for the employment of calculation. The prevalence of the several causes of disease in different countries, and under different circumstances, their period of incubation, the length of their course, their fatality—these, and a great number of similar instances, are, strictly speaking, numerical. Then, as to the action of remedies, and the relative advantage of different modes of treatment—nothing can determine these but an accurate and numerical comparison of their fatality and duration under the several methods of treatment recommended. These are a few, and but a few, of the instances in which the numerical method is the only one from which we can hope to obtain any valuable information; but these few examples will suggest to every experienced man a thousand other cases in which the employment of this method cannot fail to lead to most important results; if numbers were invariably substituted for words of doubtful meaning, scarcely a page of any medical treatise would be without its figures.—*The Value of the Numerical Method, as applied to Science, but especially to Physiology and Medicine*, by Dr Guy, Professor of Forensic Medicine, King's College, London. *Journal of the Statistical Society*.

look wistfully on the waters, however, the future comforts, to do him justice, of Marie and her father, formed the cause of his feelings at the moment. The case was hopeless at all events. A hundred years' dragging might not have brought up that book from these deep and muddy waters.

The nuptials of Jules and Marie took place a day or two after these events. Bertrand took upon himself the orderment of the marriage-festival, and he made it so splendid a one, that the single bank-note of the heritage must have deeply felt the inroad. All the friends of the family were present; and amongst them, the majority, at least of the gentlemen, were deficient in some prominent member of the body, from the nose to the right limb. But the defects of these friends of the veteran were honourably compensated by medals, and crosses, and other badges of renown. After dinner, an enormous cold tart, or pie, which Pierre publicly declared to be a new dish of his own invention, was produced with the dessert. All eyes were turned to the dish, the task of opening which fell to the pretty hands of the bride. Marie blushing began to the duty, but her first incision fell upon a hard substance, which made her declare her father's fine dish to consist of something totally indivisible and indigestible. "Ah ha!" cried Pierre triumphantly, "cut it out!" Marie did so, and the company beheld a new red morocco pocket-book, well stuffed, and marked in gilded letters with the words, "Four hundred and ninety-nine thousand francs."

Pierre roared with rapture and delight, as well he might. The sly old campaigner had thrown into the Seine nothing but the worthless old pocket-book!

Jules did not require his worthy father-in-law's laughter to tell him what meant the pocket-book in the pie. As soon as it was brought out, and the lettering read, the veteran's ruse was clear. Jules now enjoys his twenty-five thousand livres of rent, and loves his wife as much as if she had only brought him her heart for a dowry. As to his scruples, he now says he ought to have been glad to get Marie, although she had been a queen.

Jules is at this day a distinguished and honoured advocate.

PREMATURE INTERMENT.

THE possible occurrence of premature interment, and of all the inconceivable agonies that must attend a return to life and consciousness in the "narrow house appointed for all living," is an idea more frequently present to the mind of the humble and unenlightened, than to that of the educated man. It is also obvious enough that instances of this dreadful occurrence, as ascertained, or supposed to be ascertained, from appearances in opened graves, are more apt to be talked of by the peasant's fireside than in more philosophical places of assembly. The thing, altogether, has so much the reputation of a vulgar wonder, that it requires some courage to introduce it as a topic of grave discourse. That it has, nevertheless, some real value amongst matters which concern the welfare of human kind, is a point of which we are disposed to have little doubt; and we therefore have no scruple in taking it into consideration in the present place.

That much fallacy attaches to many of the ordinary symptoms of death, is, we believe, generally acknowledged. There are, indeed, certain diseases, which chiefly consist in a counterfeit of the condition of death, and often defy the most careful attempts that may be made for their detection. Ambrose Paré quotes cases where damsels of hysterical propensities have remained whole weeks to all appearance dead; and Dr Schmidt of Paderborn mentions a recent case of apparent death (*scheintod*) that came under his own eye, where the fit lasted twenty-one days. In catalepsy, one of these death-counterfeiting maladies, there is, moreover, in some instances, a consciousness of life and of surrounding circumstances and passing events, while the patient appears to all other persons as undoubtedly dead; so that he may actually know that he is undergoing the process of inhumation, without possessing the power of making known the horrors of his situation to those around him. From the fallacious nature of these symptoms it arises that individuals who have been laid out, and in every respect treated as dead, so often (for this is not unfrequent) surprise their friends by coming to life again during the interval that precedes interment, or while on the way to the grave. Nor, since revival so often takes place before interment, can we doubt that it must also occasionally take place after that event. The illustrious Bacon testifies to the truth of what is here advanced. "There have been numerous instances," he says, "of men laid out for dead, nay of some actually consigned to earth, who have notwithstanding returned to life; a fact which in the latter case has been discovered, upon opening their coffins, by wounds or contusions on the skull, occasioned by the struggles

of the unhappy men to break from their confinement. Of this we have a recent memorable example in that subtlest of the schoolmen, Joannes Scotus, who having been buried in the absence of his servant, who was aware of his master's tendency to attacks of catalepsy, was exhumed upon his return, and found in this state. The same thing happened in our own day to a player who was buried at Cambridge."

A pamphlet on the deceptive nature of the symptoms of death was lately published at Berlin, by Dr Michael Benedict Lessing of that city, and a copy of it has by chance fallen into our hands. The author writes on the subject with great earnestness, his object being to induce the Prussian government to take some measures for more effectually testing the fact of death before interment. We do not know exactly what degree of credit to attach to his opinions as a medical writer, but certainly he has shown some industry in collecting accounts of cases—perhaps, we should say, more industry in collecting than in verifying them. We shall nevertheless venture to include a few instances of prematurely presumed death from the volume of the learned German—adding one or two from other sources.

The first case we shall quote is one which has found its way into the popular fictitious literature of many nations. A rich citizen's daughter of Paris, who was married against her will, took the matter so much to heart that she died. Her disappointed lover bribed the sexton to admit him to her tomb, carried away her body, and, by the use of certain restoratives, succeeded in recalling her to life. The happy pair retired to England, whence they returned some years afterwards to Paris. The lady was recognised by her original husband, who upon this asserted his right to her property and person, and thereupon (says Dr Lessing) arose the oddest legal process imaginable; the first husband claiming the lady as his, and the second maintaining that death had dis severed any tie that his rival might have had over her, and that, since he had been the means of bringing her back to life, his she ought to be. The first husband seems to have had the best of it with the lawyers; so the lovers took fright, and retreated once more to England, leaving the nice question of right still undecided. "The steps of this singular process," says Dr Lessing, "may still be found in the Parliamentary register." We know more certainly that the story is, with some differences, in Boccaccio; that Turberville has it in his *Tragical Tales* published in 1587; and that one of our early dramatists has used the incident with great beauty in a play published in 1602, entitled "How to know a Good Wife from a Bad."

Another of the instances adduced by Dr Lessing is of a nature so much more painful in its details than what we are willing to put into these pages, that we must take leave to soften it a little. Herr Hildebrand was the proprietor of the iron-work of Bystadt, in Sweden, at which place there is a church for the use of the people connected with the establishment. One evening in 1785, the sexton, in passing this church, heard sounds, as of groans and piteous cries, issuing from the building, or rather from the ground beneath it. Unable, from superstitious fear, to reflect calmly on the probable cause of these sounds, he started off in great haste to inform his neighbours of the circumstance. Some of these, gathering a little courage, cautiously approached the church; but when they heard a voice distinctly utter exclamations of the greatest distress, and repeatedly calling on the name of the Deity, with the interjection "Mercy, mercy!" they turned, like the sexton, and fled. Next morning when the church was entered, a female form was found stretched lifeless and covered with blood on the cold pavement. It was a married daughter of the Herr Hildebrand, who had recently appeared to die in childbirth, and had been buried the day before with her unborn child in the family vault near the altar. The babe, also dead, was now found in the arms of the unhappy mother, whose history during the past night it were too painful to speculate upon.

A similar occurrence was strangely enough brought to light at Rodach, in the year 1797. A burgomaster's wife passing through the church, had the misfortune to fall into a burial vault, in consequence of the stone that covered it giving way. In extricating the citizen's dame, a fearful scene disclosed itself to the bystanders. Twenty years previous, the wife of the then Deacon Kiesewitter had died, as was thought, in giving birth to a stillborn child, and four days afterwards was laid in the grave, and her child placed, according to custom, upon her coffin. The coffin of the child was now, however, found lying at a considerable distance, and the lid of the mother's coffin thrown aside. Her right

arm was lying under her head, and the entire body turned upon its right side.

The familiar story of the sexton and the lady's ring is localised by Dr Lessing at Leipzig, the heroine being the wife of Matthew Harnisch, a bookseller. Dr Lessing is not perhaps aware that the same occurrence is said to have taken place at Cologne, in the year 1547. There is an account of it, said to have been written by the celebrated Oehlenschläger, of which we find the following translation in a fugitive work of past date:—

"Adocht, the reigning burgemaster of Cologne on the Rhine, had buried his young and handsome wife: she had been subject to frequent fits, and never recovered from the last.

The funeral had been magnificent: and a vault in the majestic cathedral was to hold the body, which had been put by in a coffin with glass panes and iron wire on the top, and, according to the manners of the time, and the rank of the family, clad in costly robes, the head adorned with a rich garland, and the fingers with precious rings.

Peter Bold, the sexton, had locked the door and made towards home, where a scene of a very different nature awaited him: his own wife had been prematurely brought to bed of a very fine boy, but he was totally unprovided with any kind of comfort requisite on such occasions: his marriage had taken place against the wish of his employers, and he had no assistance to expect from that quarter. Isaac, the Jew, came in his mind, but he would require a pledge: a pledge, murmured Bold, within himself, and why not borrow from the dead, when nothing is to be obtained from the living? I have known this self-same lady that lies now yonder; she would not have refused a poor man in the days of her bloom, and why should her manes now begrudge what will do me good, without harming any one?

Under reflections such as these, he returned to the place which he had but just left, but where he now trod in a very different mood; he had been before in his duty, and now he came to commit sacrilege. How awful was the lonely stillness of the immense building, and how threatening were the looks of the saints on the walls, and of the cherubs over the pulpit! His courage had almost forsaken him when passing the altar; he had there to encounter the image of St Peter himself, who was his own patron as well as that of the church; but the remembrance of his miserable wife and child overcame every other consideration, and on he went through the long choir towards the vault.

The countenance of this lovely woman had nothing to renew his terror, and fearlessly he removed the lid and seized her hand. But what were his feelings when that hand grasped his wrist! He made an effort to get loose, and left not only his mantle, but his lantern.

Running away in the dark, he fell over a projecting stone, and lay for some time senseless on the floor; but as soon as he recovered, he hastened towards the house of the senator, partly to unburden his conscience, but still more to send assistance into the vault, as he found himself utterly incapable of returning again to make examination.

In the mean time, the lady had entirely recovered her senses: she overturned, indeed, the lantern, with the first motion of her arms, and was therefore for a while in the dark; but the moon cast a feeble light through a small opening in the top, and by degrees she began to recognise the place. She felt around her, and met with the golden ornaments on her head, and the rustling thin silk in which she was dressed. Oh, agony! oh, despair! she was buried alive. She uttered a cry; but she knew too well that it would not be heard. The vault was just under the choir; and what voice could penetrate the massive arches! The little air-hole opened into a private part of the churchyard, which was separated from the rest by an iron railing, and might not be visited for a considerable time.

Her dead ancestors were then to be her last companions; and her last occupation was to be that of tracing with her nails upon the black walls the melancholy progress of her real death.

Chilled with horror, she sought for something to cover herself, and she found the cloak which Peter had dropped: the warmth which it communicated revived her a little; she recovered strength enough to get out of the coffin, and to throw herself on her knees, imploring the mercy of heaven; she then attempted to get to the door, and to move its rusty latch. But who can paint her joy when she found it open! She crept mechanically through the dark and narrow passage, and perceiving the influence of a better air as she advanced, she was thereby enabled to drag herself up stairs: here she was, however, so faint that a deadly cold seized her, and would most likely have made her sink down for ever, had she not fortunately recollected that some little wine might have been left from the last mass; she made therefore one effort more to reach the altar, and met with just as much as was sufficient for her exhausted frame.

No true believer had ever set the cup to his lips with more sincere devotion and gratitude towards his Creator, than she did thus administer the cheering draught to herself. Her husband and servants found her in that very act, and used such further means for her complete restoration, that in a few weeks afterwards she could appear again in the same place, to stand godmother for the sexton's child."

A Stuttgart newspaper for 1828 mentions a recent case of revival at the point of interment, which termi-

nated fatally, in consequence of the stupidity of the persons present. While the grave-digger was shovelling the earth upon the coffin, his attention was arrested by a continued knocking from below. He called several other people to the spot, and their impression was, that the sounds came from the head and foot of the coffin. They were exactly like some one knocking at a door with the fists, or kicking with the feet against some hollow vessel, and they came every moment with redoubled force. The blows were frequently repeated at brief intervals. Within half an hour afterwards, the coffin was disinterred; but by this time the knocking had ceased. The body was found to have changed its position, and gave various other indications that life had only recently become extinct.

One of the most extraordinary cases of apparent death we have met with, in extent of duration at least, is the following, mentioned by the late Dr Macnish in his *Philosophy of Sleep*. A young lady, in the suite of the princess of N. N., had been long confined to bed by a violent nervous ailment, and ultimately to all appearance died. Her lips were quite pale, her face assumed a deathlike hue, her body was icy cold. She was carried from the chamber where she lay, laid in a coffin, and a day appointed for her funeral. It came, and, according to the practice of the country, several dirges and spiritual songs were chanted before the house. Just as the people in attendance were about to nail down the coffin lid, they remarked a sort of sweat upon the body, which every moment increased, and at last a convulsive motion in the hands and feet became perceptible. Some minutes afterwards, during which fresh signs of returning animation were apparent, she opened her eyes, and gave utterance to a loud and most piteous wail. In a few days she had entirely recovered. The account which she gave of her state of mind during the continuance of this lethargy, is extremely curious. It seemed to her as though she dreamt that she was really dead, only she was perfectly conscious of every thing that was passing around her. She heard distinctly the whispers and lamentations of her friends beside her. She felt them robing her in her shroud, and laying her out in the coffin. The feeling occasioned her an agony beyond description. She strove to scream out, but had not the power to do so. The will had lost its control over the corporeal functions. She had the excruciating feeling of being in the body and out of it at one and the same time. To stir hand or foot, or to open her eyes, was alike impossible. Her torture reached its height when the dirge commenced, and the coffin lid was on the point of being nailed down. The thought of being interred alive at length brought back the nervous system to activity, and enabled it to operate upon the muscular powers.

Dr Lessing, if possible, increases the horror we naturally feel in thinking of a revival in an entombed coffin, by stating that life would not in such cases be so quickly extinguished as we are apt to suppose. He calculates that the vacant space in most coffins contains air sufficient to support life for a space of between forty minutes and an hour. He further remarks, that, from the nature of the circumstances, the fact of revival is probably detected in but a very small proportion of the whole number of instances. He points very earnestly to means for preventing this dreadful occurrence. He proposes that houses should be set apart in all considerable seats of population for the disposal of the dead, or the presumed dead, there to lie for a certain time under proper medical superintendence, and interment not to take place till a proper certificate has been obtained that all hope of recovery is past. Such houses are kept up in various large cities throughout the world: that at Munich is thus described by a recent visitor:—"The bodies of all persons, of whatever rank (the court excepted), who die at Munich, are conveyed to the Dead-House, where they remain exposed for a period of twenty-four hours, previous to interment, with the view of guarding against the chances of living inhumation. A constant watch is kept in each apartment; and I had understood that an alarm apparatus was attached to each body, so constructed that the slightest movement consequent on resuscitation should cause the violent ringing of a bell. I could, however, discover no traces of such an apparatus. There were ten bodies exposed on the occasion of my visit—seven children and three adults. The public are not allowed to enter the apartments of the dead, but a clear view of each inmate is easily had through glass doors."—*Notes of a Wanderer, by W. F. Cumming, M.D., 1839.* It would be curious to calculate how many awful cases of authenticated living inhumation it would take to rouse the British people to the establishment of houses for the ascertainment of death. Though this decisive means of prevention is not to be hoped for, it might be well that individuals exercised greater caution in burying the dead—not only perhaps keeping them a little longer than is customary, but making either slight incisions for the purpose of rousing any latent spark of life, or such greater lesions as would put death beyond all question. A Lady Dryden, widow of an English baronet, was so much impressed with the propriety of the latter precaution, that, at her death in 1789, she was found to have left twenty pounds in her will to her surgeon, as payment for his cutting her carotid artery previous to her interment. We have ourselves been witness to two cases, in which, from the appearance of colour on the cheeks of the presumed corpse, and the absence of all disagreeable effluvia, we could not help wishing

that the funeral had been postponed, being greatly disposed to fear that life was not altogether extinct. In such cases, except for the slight inconvenience of perhaps countermanding a few invitations, it would be easy, as it would unquestionably be proper, to delay the funeral, if not to take some more active measure.

ARABIAN MISSION TO FRANCE.

A FRENCH public journal, a month or two ago, related that five young Arabs had lately arrived at Marseilles, attired in their national costume. According to the account presented, these interesting strangers belong to some of the first families in the province of Constantine (the scene of the recent French wars in Africa), and have been sent by their friends to France, for the purpose of seeing and acquiring knowledge in that country. From the central position of Constantine in the Algerine territories, its inhabitants are entirely strangers to European manners and inventions. As soon as these young Arabs set foot in France, accordingly, their admiration rose to a great height. When at Toulon, they could find no way to express their astonishment, except by comparing what they saw to the scenes described in their own national fairy tales. The *Montebello*, a magnificent man-of-war, struck them with the greatest amazement, its one hundred and twenty large cannon being truly an overwhelming spectacle to those whose whole nation could muster no more than one or two field-pieces in their greatest battles! The apartments of the same floating palace are larger than those of the Bey of Constantine's grandest mansion, and would cost more than fifty such regal or vice-regal abodes; the great dockyards and immense warehouses of the port; the vast coppers or boilers, resembling houses of metal, and exceeding in bulk the most spacious Arab tents; such objects as these, combined with the swarming houses and population seen on the way between Marseilles and Toulon, were not ill calculated, indeed, to make a striking impression at the outset on these youths, accustomed only to witness the feeble operations of a people without industry and without arts, and to look on a soil, which is, throughout, one wide and almost tenantless desert.

The sight of the three thousand galley-slaves at Toulon, all working at employments which tended to the general benefit of society, inspired the young Arabs with a strong sense of the wisdom and philanthropy of the people among whom they had come. In their own country, these three thousand criminals would have at once been decapitated, and thus been lost to mankind; and a forcible impression of the greater wisdom, not to say humanity, of a more lenient criminal code than their own, was consequently stamped upon the minds of these youths. Destined to be leaders in their own land, they may become instrumental, through the impressions thus received, in redeeming their countrymen from the chains of judicial barbarism.

On their entering, for the first time, a splendid coffee-room at Marseilles, those who accompanied the African strangers witnessed a strange scene. The young Arabs believed themselves to be in the midst of strangers, but, to their astonishment, a voice cried out, "Saad! Saad!" and a young French officer sprang forward, and embraced the youngest of the five strangers. Saad, as this Arab was called, seemed about sixteen years old. Eighteen months back, he had been in the perilous and destructive expedition of General Negrier to Stora, and had there fought in the French ranks by the side of his father, the Caid Ali, chief of one of the four departments of the province of Constantine, and a man proverbial for his bravery, of which he gave many astonishing proofs during the recent wars.

The young officer ardently expressed his affection for his former companion-in-arms, and recalled to the young Arab's mind the circumstances of several combats in which they had shared. Above all, the officer spoke of one occasion, where he and six or seven other Frenchmen had been relieved, when in the midst of enemies, by a special succour sent by Saad's father. "Would that I could see one of that brave band," exclaimed the officer, "who came to save us in that strait!" The young Arab timidly replied, "See here! Lamzi, the friend of my father, and my companion on this journey—he it was who led the party of which you speak!" The French officer presented his hand with grateful and friendly vivacity to the Arab pointed out by Saad, exclaiming, "How! was it indeed you?" Lamzi, whose figure and air were worthy of a master-pencil, replied with calm modesty, "It was I!"

Such have been the incidents attending the first steps of the young Arabs in France. There is every reason to hope, if their journey continues to wear the same aspect with which it has begun, that these youths will one day contribute powerfully to the overthrow of the fanatical prejudices entertained by their countrymen against Europeans, and which have been mainly instrumental in keeping a large portion of Africa, for a series of ages, in savage darkness and ignorance. The names and ages of the five Arabs are as follow:—Ahmed, aged 27 years; Saad, 16 years; Saleh, 20 years; Lamzi, 33 years; and Maley, 19 years.

So far runs the narrative of the French paper. The French Marshal Valée, who now commands in the Algerine provinces, seems to have promoted, if not suggested, the mission of these Arab youths, and certainly the scheme appears calculated to produce the best ultimate results. A barbarous people, it is no more than natural to think, will be most readily brought within the pale of civilisation by individuals of their

own race, acquainted thoroughly with their disposition and habits. Peter the Great of Russia gave memorable countenance to this principle, and Mehemet of Egypt has for many years made it a part of his improving policy to send numbers of young men to all the large cities of Europe, for the purpose not only of acquiring such knowledge as may be got from books, but of learning handicraft trades by actual practice of them. Young Egyptians came to Edinburgh recently with this view, and spent several years in the city, working daily at different trades. On going home, they would be able to act as teachers to others. Such results cannot be expected from the visit of the five Arabs, on account of the probable shortness of their stay. Their influence on their countrymen must be moral in its nature. But this visit may and ought to be followed by others on more extended principles.

REMARKABLE CASE OF DERANGEMENT OF VISION.

THE following remarkable case of derangement of vision, produced by a casual injury on the head, is given in a late number of the *Phrenological Journal*. We of course leave our readers to make up their own minds as to the definitions and conclusions of the writer, it being our design neither to advocate nor defend phrenology, but simply to furnish a subject for rational reflection and investigation. The case is communicated by Dr Otto, Professor of Medicine in the University of Copenhagen, and we suppose occurred in Denmark.

"In the month of February 1837, N. H., a labourer, had a fall on the ice, and was carried home insensible. On arousing from his state of unconsciousness, he felt a slight degree of pain in the right super-orbital region, the part on which he had fallen, and a tumour formed there equal in size to a closed fist, but which disappeared in the course of a couple of days, as well as the pain, so that the patient, notwithstanding some peculiar hallucinations, could attend to his usual occupations on the fourth day. He afterwards consulted several physicians on account of the affection that remained, and after the unsuccessful trial of antiphlogistic treatment, he came to Dr Fleischmann of Erlangen, in July following. The most remarkable morbid symptoms then were as follow:—Ever since the fall, whenever he opens both eyes, he sees all external objects at an unusual distance from him. He falls consequently very often into ditches, and hurts himself on stones, which, according to his perceptions, yet lie far from him. An object lying about a foot from him, appears to himself to be at five or six feet distance, and a man at the distance of forty paces appears to be a quarter of a German mile from him. He judges quite correctly of the form and colour of external objects, according to the distance at which they appear to him; that is, if an object seems to be only six or eight paces from him, he then perceives its form and colour even as well as in his healthy days he perceived an object six or eight paces from him; but if he thinks an object to be at the distance of a quarter of a German mile, its form and colour appear to him even as indistinct as it really was in that distance. It is likewise remarkable, that, when he keeps the left eye shut, he again sees all objects in the right distance; and he is then able to walk safely, to read, &c. If, on the contrary, he opens the left eye, whilst he looks with the right eye, all the objects, at the same moment that it is opened, are observed in their real distance, but they immediately retreat farther and farther from him, so that at last they are thought to be at a greater distance than they really are. If both eyes are kept open, he also in a distance of six feet sees all objects double for a short time; and if both eyes are kept open for a longer time, he gets a little confused in his head, sees small worms or lines, has tingling in his ears, becomes as if intoxicated, stumbles over his own legs, &c. But if he again shuts the left eye, this state again disappears suddenly, he feels better, and sees as in his healthy days. Finally, if he shuts the right eye, and looks only with the left one, all objects indeed appear to him farther distant than they really are, yet not to that degree of distance in which they appear to be when he keeps open both eyes. Not the least morbid change can be observed in the eyes, on the most close examination, excepting only a little squinting of the left eye when it looks upwards. The clearer the weather is, the better he feels; but in foggy and cloudy weather, his head is heavy; he sees small worms and light lines, and perceives a sort of biting in the angles of the eyes, as if there were salt in them. When he scratches his head, or makes a false step, it appears to him as if the right side of his head was hollow. His health is otherwise perfect. All means, and amongst these galvanism, have been hitherto tried without success.

This remarkable case is related in Hufeland's *Medical Journal*, for July 1838, by Dr Fleischmann of Erlangen, who takes infinite trouble to explain it, yet in a manner that involves him in contradictions and absurdities. But if the author had thought it worth while to make himself acquainted with phrenology, he would have been able to explain the whole case in a clear and satisfactory way. To phrenology it is an extremely valuable case, as this true and interesting science is confirmed by it, on the one hand, and on the other it enables us to unriddle at once what seems quite incomprehensible to other observers.

The external senses conduct, by their respective nerves, only the impressions of external objects to

particular parts of the brain, which perceive them. If the connection between the nerves of the senses and these parts of the brain is interrupted, the individual immediately ceases to see, hear, smell, taste, and feel the objects acting on the senses. The whole function of the external senses consists in receiving and propagating the impressions to the organs of the inner faculties, and in consequence we, properly speaking, do not see with the eyes, nor hear with the ears, &c., but employ these parts only as instruments, by which the impressions are sent to the brain, which perceives them, and suggests the clear idea of them. In that part of the brain situate immediately above the eyes is the organ of Size, supposed by phrenologists to be the organ which enables us to perceive the size, extension, and the distance of objects. The optic nerve receives and propagates the impression of an object also to this part of the brain, and the individual is then able, if the cerebral part is healthy, to judge rightly of the distance of the object; but if the part is morbidly affected, the idea of the distance of objects must be deranged.

By the fall on the super-orbital region, the cerebral organ of Size appears to have sustained an injury, probably on the right side, where pain and swelling were induced. But the other cerebral parts, immediately adjacent, appear not to have been affected; and, accordingly, the forms and colours of objects are correctly perceived, whilst their size and distance are judged falsely. That the patient sees all objects at their right distance, when the left eye is kept shut, is easily accounted for by the decussation of the optic nerves; the impression of the objects being consequently propagated from the right optic nerve to the organ of Size on the left side, which is sound, and its function duly performed. The contrary holds good when the left eye is open, the optic nerve of which communicates with the right hemisphere of the brain, which was the side injured by the fall. Double vision is thus induced when both eyes are open, and confusion and stumbling are caused by it."

POPULAR INFORMATION ON SCIENCE.

ON THE ELECTRICITY OF ANIMALS; ESPECIALLY THAT CALLED ANIMAL ELECTRICITY.

FIRST ARTICLE.

WE purpose, for the entertainment of our readers, to direct their attention for a little to the subject of *Animal Electricity*, a power possessed by certain animals, whereby they can, at will, inflict electric shocks, or, in other words, can employ the thunderbolt on a small scale, for the accomplishment of various important objects essential to their well-being. This subject is interesting, not only as being intimately connected with that all-pervading and mysterious agent electricity, but also as exhibiting one of the most singular means of self-defence supplied to living beings, while at the same time it suggests some very curious considerations touching the functions of the muscular and nervous systems, of all others, perhaps, the most important subjects connected with physiological science.

Before proceeding to the subject of *animal electricity*, it is necessary to explain distinctly what, according to the present arrangements of science (how correctly, this is not the place to discuss), is meant by the term; and the more so, as it has now acquired a meaning different from that which it possessed when first introduced into the vocabulary of science by the distinguished Galvani. The wife of this celebrated philosopher having accidentally discovered that the leg of a frog, which had been for some time dead, was thrown into violent convulsions when its principal nerve was touched by a piece of metal, the professor was led to commence those curious researches which now, under his honoured name, comprehend one of the most exciting fields of speculation. Galvani speedily found that it was an easy matter to excite muscular action in the bodies of animals recently dead, by establishing a communication through certain metals between the nerves and the muscles of the animal; and this not only in cold-blooded animals, which long retain their vital properties, but also in those which are warm-blooded, and even in man himself. From these discoveries, the learned anatomist was led to conclude that the action was produced by some fluid existing in the nerves in a state of accumulation, which, being attracted by the metals, passed along them to the muscles; and to this ideal fluid, or agent, he applied the name of animal electricity. These ideas prevail in the writings of Galvani's contemporaries; and the very expression, as originally used, is still retained in some elementary works. But it having been long ago demonstrated, and especially by Volta, that the action of the muscles in this case was owing not to any peculiar fluid existing in the nerves, but merely to the electricity produced by the metals employed, and to which the nerves acted simply as conductors, the term *animal electricity*, as thus used, was demonstrated to be alto-

gether incorrect and deceptive, and must therefore be abandoned.

But, further, animal electricity in the limited sense in which it is now employed, must be distinguished from electricity existing in the bodies of animals in a diffused state, as it always does in a certain degree, and sometimes to such an extent as to produce phenomena of a sufficiently curious description. M. Hemmer, of Mannheim, found, in the year 1786, that the electricity of the human body is common to all individuals, though varying greatly under different circumstances. In 2422 experiments, it was ascertained to be 1252 times positive, 771 times negative, and 399 times imperceptible. More recently, Messrs Pfaff and Ahrens, by employing improved instruments, have obtained more striking results, of which the following are a few. Irritable men, of sanguine temperament, have more free electricity than those of an opposite dull habit; electricity accumulates towards the evening; spirituous drinks augment its intensity; while the body is cold in winter, no electricity is manifested; the whole body naked, as well as every part, shows the same phenomenon; electricity is diminished during rheumatism."* As might be anticipated, the electricity evolved in some individuals is much stronger and more copious than in others, and many singular instances of this nature have been recorded. It is said of Wolimer, king of the Goths, that he could emit sparks from his body. Cardan relates that sparks were emitted from the hair of a Carmelite monk, whenever it was stroked backwards; and Faber mentions a young woman from whose hair sparks of fire always fell when it was combed. Cassandra Buri, a Veronese lady, often terrified her maid servants by brilliant sparks, and a crackling noise, which were emitted when her body was rubbed, or even touched slightly, by a linen cloth. The most remarkable case, however, of the generation of electricity in the human subject at present on record, is one which, in January 1838, was related in America. The subject of it, a lady, was for many months in an electric state so different from that of surrounding objects, that whenever she was but slightly insulated by a carpet or other feebly conducting medium, sparks passed between her person and any object which she approached. From the pain which accompanied the passage of the sparks, her condition was a source of much discomfort to her. When most favourably circumstanced, four sparks a minute would pass from her finger to the brass ball of the stove at a distance of an inch and a half. The circumstances which appeared most favourable to the generation of electricity, were an atmosphere of about 80 degrees, tranquillity of mind, and social enjoyment, while a low temperature and depressing emotions diminished it in a corresponding degree. Its first appearance was sudden during the occurrence of a vivid aurora borealis, and its departure was gradual. Various experiments were made with the view of ascertaining if the electricity was generated by the friction of articles of dress, but no change in these seemed to modify its intensity.† Somewhat similar phenomena have been observed in the lower animals, of which the domestic cat affords a familiar example. Of the cat, indeed, it has been stated that electricity may be accumulated in its body, and given off suddenly so as to produce a shock. Romer says, if one take a cat in his lap in dry weather, and apply the left hand to its breast, while with the right he strokes its back, at first he only obtains a few sparks from the hair; but after continuing to stroke for some time, he receives a sharp shock, which is often felt above the wrists of both arms. At the same moment the animal runs off with expressions of terror, and will seldom submit itself to a second experiment. Here, then, unquestionably, is electricity produced in the bodies of animals; and yet, as, according to the present approved nomenclature, it is not to be classed under the head of animal electricity, we have deemed it important to dwell upon these spurious examples, that we may clearly point out their distinction from the true. In the cases upon which we have hitherto been insisting, the electricity has the same origin with common electricity, and is exhibited in the animals as it would be in organic or dead matter similarly circumstanced, whereas true *animal electricity*, as the term is now confined, has a very different origin. It is not developed by any of the usual excitants of common electricity; there is no chemical action in the case, no friction, no alteration of temperature, no pressure. In this genuine animal electricity, the exercise of the animal's will, and the integrity of its nervous system, and of the peculiar electric organs, seem alone sufficient for its evolution.

It has been stated within these few years, "That the animals endowed with this faculty with which we are acquainted, are all fishes." The rapid advance of science is manifested by the fact that the phenomenon has lately been recognised in other and very different classes of the animal series. The attention of our readers has lately been directed to this novel fact in the *annelides* and *infusoria*, in which, with the help of the microscope, electric sparks have been seen though not felt, and brilliant sparks have been witnessed issuing from these animals in a ratio inversely as their size. Appearances have likewise led to the conclusion, that the steady luminosity or shining of many insects, as, for example, of the glow-worm, is produced from the same cause. It is mentioned in a highly esteemed work on entomology, that when an insect endowed with

this power was placed on the palm of the hand, the observer experienced a shock which extended even to the shoulder, and that immediately afterwards he perceived in his hand red spots at the places where the six feet of the insect rested.* Margrave describes another insect, a native of Brazil, which, on being touched, gave a shock which was felt through the whole body. According to Molina, when one of the *Sepia*, or cuttle-fish as it is called, is seized with the naked hand, a degree of numbness is felt, which continues for a few minutes, whilst one of the *Polypi*, as stated by Treviranus, communicated to the hand a sensation like that of an electric shock. Many, if not all of these examples, appear to be manifestations of true animal electricity, and it is to be regretted that hitherto so few observations have been made in illustration of them. We shall therefore no longer insist upon them at present, but proceed to those better ascertained and marked instances which occur in fishes, and which have been often made the subject of deep and searching investigation.

The list of electrical fishes at present known, extends to the number of six. Two of these are the established species of the well-known torpedo; the third is the *Gymnotus*; then, the famous *Silurus* of the Nile; the *Trichiure*; and finally the *Tetraodon electricus*. Two of these, the *Gymnote* and *Silurus*, are fresh-water fish, whilst the others are marine; and hence their peculiar power is in no way dependent upon the characters of sea water. We shall first make a few remarks upon the natural history of these fishes individually, and shall then consider more particularly the peculiar property they possess in common.

The TORPEDO, known among English fishermen as the *numb-fish* and *cramp-fish*, has been celebrated both by ancients and moderns for its wonderful faculty of causing sudden numbness and torpor, sometimes attended with cramp, in the limbs of those who touch it. The names *tremola* of the Romans, and *haddayla* (signifying benumbing or paralyzing) of the Maltese, point to this property. This power, the ancients, unacquainted with the theory of electricity, were contented to admire, without attempting to explain, and, as is usual in such cases, generally magnified its effects. Hence Pliny states that the torpedo, even when touched with a spear or stick, can benumb the strongest arm, and arrest the swiftest foot; and hence those elegant lines of Mr Pennant, from Claudian's paraphrase of Oppian, in which it is stated that the astonished angler is suddenly reduced to a state of helpless stupefaction:

The hooked torpedo, with instinctive force,
Calls all his magic from its secret source:
Quick through the slender line and polished wand
It darts, and tingles in the offending hand.
The palsied fisherman, in dumb surprise,
Feels through his frame the chilling vapours rise
Drops the lost rod, and seems, in stiff'ning pain,
Some frost-fixed wanderer on the polar plain.

The torpedo resembles, generally, the common skate, and was in fact arranged by naturalists till lately in the same genus. It differs, however, in this, as in other respects, that whilst most of the skates are somewhat square-shaped, the main portion of the cramp-fish, composed of head and body, is very nearly circular, having a short tail appended to it. As we have stated, there is no kind of distinction between the head and trunk, and the eyes, well forward on the body, are situated near each other on each side of these, oval-shaped, proceeding outwards and backwards, may be perceived the external marks of the electric organs. The dimensions of the largest individual we have seen described were 4 feet in length, 2½ in extreme breadth, and 4½ inches in extreme thickness: this fish weighed 53 pounds. They have, however, been taken on the coast of England weighing as much as 60 and 80 pounds; and Colonel Montague examined a very large specimen, taken by the hook, off the coast of Tenby in Wales, which weighed about 100 pounds. Its body is perfectly smooth, and slightly convex above; it is of a dark ash colour, with somewhat of a purple hue; sometimes of a pale reddish-brown, and frequently dotted with several large circular dusky spots regularly arranged; the under surface is whitish or flesh-coloured. Its distribution is extensive, as it is found in large quantities in the Mediterranean and off the west coast of France, and more sparingly off the southern shores of the British Isles: it is also frequent in Table-Bay, Cape of Good Hope, in the Persian Gulf, and in the Atlantic and Pacific Oceans. It seems usually to frequent deep waters with a muddy bottom, where it is captured with the net, and sometimes also by the hook. When surprised by the retreating of the tide, and arrested in its return to deep water, according to Mr Walsh, it buries itself in the sand, and, by the flapping of its extremities all around, soon sinks itself a bed, and throws the sand in a light shower over its back, when neither the animal nor the spot in which it lies can be distinguished.

The curious electrical organs of the torpedo were described by the celebrated John Hunter and others, and we shall now supply an epitome of their accounts. The individual which Mr Hunter examined was one foot and a half long. The electric organs were as usual placed on each side of the head and gills, reaching thence to near the outer margins of the body, and extending longitudinally from the anterior extremity of the animal to the membrane which divides the belly from the chest; within these limits they occupy the whole space between the skin of the upper and under

* Cyclopaedia of Anatomy and Physiology.

* Kirby and Spence, l. 110.

surfaces. Each organ was attached to the surrounding parts by close cellular membrane, and was covered above and beneath by the common skin. Each organ was five inches long, at the anterior extremity three in breadth, and about half as much at the posterior part. Each (honeycomb-like) consisted wholly of perpendicular columns, reaching from the upper to the under surface of the body, the largest column being about an inch and a half long, the shortest about a quarter of an inch. The columns are somewhat irregularly shaped, most of them being six-sided, others five-sided, and many square: their coats are exceedingly thin and transparent, closely connected with each other; their number seems to differ with the size of the animal; in the smaller they amounted to about 470, but in a large fish there are sometimes three times the number. Each column is divided by horizontal partitions, placed above each other, at very small distances, and forming numerous cells which appear to contain a fluid. The number of these, counting within the space of an inch of the column, is about 150. These partitions are so very delicate, that they can scarcely be recognised in the fresh fish, and Dr Davy informs us that he never was able to detect them in the recent animal. Dr Coldstream, however, states that he and Dr Allen Thomson readily recognised the structure described by Mr Hunter, in specimens which for a time had been preserved in spirits. This apparatus is most abundantly supplied with nerves, on which point Mr Hunter remarks: "The magnitude and number of the nerves bestowed on these organs in proportion to their size, must, on reflection, appear as extraordinary as the phenomena they afford; there is no part of any animal with which I am acquainted which has so great a proportion of nerves."* No contraction has ever been seen in the electrical organs, so that there is no reason to suppose that any muscular fibres enter into their composition. In all directions, however, they are exposed to the compression of very strong muscles, of which Dr Davy remarks: "Without entering into any minute anatomical examination of these muscles and their uses, it is only necessary to compare them in the torpedo, and in any other species of skate, to be convinced that they are adequate to and designed for the effect mentioned, namely, compressing the electric organs."†

M. Geoffroy St Hilaire examined the fluid contained in the cells, and found that it consisted of something very like the white of an egg (albumen), and animal jelly (gelatine), and, what is very curious, he discovered organs very similar to those of the torpedo, in other species of the skate genus which are altogether destitute of the electrical power. The proportion of fluid, also, which enters into the composition of this apparatus, is most extraordinary. Dr Davy found that seven parts only out of the hundred remained after it was dried by the heat of boiling water. The electric organs of the smallest torpedo employed by Dr Davy contained only fourteen grains of solid matter; yet this small mass of matter gave sharp shocks, and manifested other proofs of electricity. "How inconceivable," he adds, "that these effects could be produced by such a cause!"

The torpedo, as will afterwards appear, has been examined more frequently than any other of the electrical fishes, and in it especially has been noticed a double kind of action, which, probably, they all possess, namely, a power of communicating a tremor, as well as a shock. As to the *tremor*, well expressed by the name *tremola* of the Italians, Dr Lugenhousz thus testifies in his letter to Sir J. Pringle: "As I could get no torpedo alive in my lodgings at Leghorn, I hired a fishing-vessel, with eighteen men in her, and went about twenty miles to sea, where the bottom is muddy, and where these fish are chiefly to be found. We caught five, of which four were about a foot in length. As soon as they were hauled upon deck, I put them into a tub filled with sea-water. I took one of the torpedos in my hand, so that my thumbs pressed gently on the upper side of the electric organs, whilst my fore-fingers pressed the opposite side. About a minute or two after, I felt a sudden trembling in my thumbs, which extended no farther than my hands: this lasted about two or three seconds. After some seconds more, the same trembling was felt again. Sometimes it did not return in several minutes, and then came again at very different intervals. Sometimes I felt the trembling both in my fingers and thumbs. These tremors gave me the same sensation as if a great number of electrical batteries were discharged through my hand very quickly, one after the other. The fish occasioned this trembling as well out of the water as in it: sometimes it was very weak, and at other times so strong that I was very near being obliged to quit my hold."‡ Again, as to the *shock* of this animal, its English names of *numb* and *cramp* fish seem to have a more especial allusion. Mr Grant, a wholesale fishmonger at Brixham, informed Mr Walsh that the benumbing quality is pretty strong through the net, though much weaker than when removed from it. A vigorous torpedo causes a momentary shock, which is felt through the arm, as far as the shoulder, and leaves a degree of numbness in the fingers and hands. Some have compared the sensation produced to that felt in the arm when the nerve at the point of the elbow is struck; and others, who have been accustomed to receive electric shocks, have declared the sensation to be extremely painful. Gay-Lussac and Baron Humboldt, who expe-

rimented upon the animal at Naples in the year 1805, say that its stroke is more painful than a strong discharge produced by the Leyden phial, and that the shock of one fourteen inches long is with difficulty supported.

When the torpedo lies concealed, as previously mentioned, under the sand, which Mr Walsh asserts is its favourite situation, "it is celebrated for giving its most forcible shock, so as to throw down the astonished passenger who inadvertently treads upon it."* Some naturalists have expressed doubts as to the possibility of this occurrence, and probably it may be exaggerated, but as the phenomenon occurs with the gymnote, Mr Walsh's statement is probably substantially correct.

A PARTY OF CRUSOES ON A DESERT ISLAND.

In the London newspapers of 1823, there appeared a most interesting and affecting account of the wreck and loss of a small English trading vessel in the Indian Ocean, with a narrative of the preservation of the crew on some obscure islets lying out of the usual track of navigation, at the distance of six or seven hundred miles south-east from the Cape of Good Hope. The account presented was in substance as follows:—

On the 9th of May 1820, the Princess of Wales smack, of 75 tons burden, commanded by Mr T. Beckwith, sailed from the Thames for Prince Edward's Island in the Indian Ocean, with a crew of fifteen men, for the purpose of catching seals and other cetaceous animals for the sake of their skins. The voyage was every way prosperous; the vessel arrived at its destination, where the seal-catching commenced on the 1st November, and remained till the subsequent March, 1821. Having, as it would appear, exhausted the objects of pursuit in this quarter, the vessel proceeded farther to some desert islands, called the Crozettes, situated 47 degrees south latitude, and 47 degrees east longitude. This proved a fatal adventure. On the 17th of March, on reaching the Crozettes, a party of eight seamen was dispatched in a boat to one of the islands, there to remain some time seal-catching, while the vessel proceeded to another island to land a party for the same purpose. In the course of the day, after reaching the second island, a heavy swell began to set in towards the shore, and the captain, in order to gain an offing, was obliged to slip the cable, and endeavour to stand out to sea. Such, however, was the strength of the current, and the unmanageableness of the vessel, that the most serious apprehensions were entertained for its safety. In this condition the crew continued in hourly expectation of striking on outlying reefs until midnight, when, to settle all doubts on the subject, the unfortunate bark struck with tremendous force.

The striking of a vessel, whether on sand-banks or rocks, particularly the latter, is ordinarily the signal of destruction. On the present occasion, the crew instantly expected such a catastrophe, and proposed to get out the boat and try to gain the island; but the captain, who knew its desolate condition, and believed they could only linger out a few days there in dreadful want, opposed the proposition, and he chose rather to close his sufferings by a speedy death as the less horrible alternative. The crew, however, considered that there was still hope, and, under the circumstances, assuming the right of acting for themselves, they got the boat out over the gunwale, and threw into her a few things which they were able hastily to collect. Still, however, they refused to leave their captain to perish, and, after some entreaty, they prevailed upon him to commit himself to the boat with them. The night was dark, rainy, and boisterous, and the sea dashed over the rocks by which they were surrounded. They found the shore to be much nearer than they expected, but could not land, as it was bounded by a perpendicular rock. After rowing about for nearly four hours, they came into a sort of cove, where they got on shore in safety, but the boat was swamped. How they escaped the rocks in that darkness and heavy sea, was afterwards matter of astonishment to them. They hauled up the boat, turned it over, and got under it.

When the day broke, they perceived the vessel lying on her beam-ends, with a large hole in her lower planks, which proved that from the instant she first struck she could not afterwards have lived. The sea was washing over her, and it was evident that she must soon go to pieces. They were unable to launch the boat to save any thing from the wreck. Amongst the articles put into the boat was a tinder-box, and with a few materials which they picked up on the shore they made a fire, and caught a few birds, which they dressed.

On the next day they succeeded in launching the boat, and proceeded in her to a cove at about five miles distant, which was nearer the vessel. They succeeded in reaching her, and getting out the captain's and the mate's chests, landing them, and in picking up a number of planks. The next day they picked up a try-sail, and some coals of bread which were spoilt, but a gale coming on, prevented them from putting out in the boat to visit the wreck, as it blew furiously. The next day they saw, to their distress, that nothing was left of her but the masts, which had become entangled by the rigging among the rocks, and these soon disappeared. They then hauled the boat up, to live, or rather to sleep under her, and this was their only shelter for three weeks, during which time they subsisted chiefly on birds, and the tongues and hearts of sea-elephants.

They had got some of their hunting implements on shore, and were able to kill this animal with ease, whenever they caught it, and its great importance to them will appear in the course of the narrative. The weather was so rainy and inclement, that, until the end of three weeks, they were unable to begin to erect any commodious shelter. At the expiration of that time they collected all the timber they could find, for the island did not produce a shrub. With a part of these materials, and some stones, at the end of a few weeks they completed a house or shed. They covered the top with sea-elephants' skins to keep out the rain, and the weather, at the sides, by means of turf. They made their beds of a soft dry grass, with which the island abounded, and over this they had coverlets of sea-elephants' skins, and on the whole they made their shelter tolerable. Knowing that it was useless to repine, they soon organised a settled course of life in their little community. Their chief occupation consisted in foraging for the means of subsistence within the limits of the island. Seals and sea-elephants were the game which they principally depended upon, and these they daily went in quest of. The sea-elephant was their grand main-stay, for it yielded not only some parts fit for food, but a large quantity of blubber, which, being mixed with dried grass, made excellent fuel. They likewise hunted a species of sea-fowl which settled on the island to burrow and lay eggs in the sand, and which they seized without any difficulty. In the mornings they rose about eight o'clock and breakfasted on these birds, after which they went out to hunt, leaving one or two behind to cook dinner. This dinner consisted generally of a sort of soup composed of sea-elephants' flippers, heart and tongue, chopped in pieces. They could find no vegetables on the island, which produced nothing but grass, excepting a plant like a cabbage that was extremely bitter, and this they made use of occasionally to flavour their soup. Great inconveniences were at first sustained for want of proper eating utensils, as there was only the large kettle in which their soup was made. They managed, however, to make some wooden spoons for themselves. They next cut down an old cask, and with it made a kind of soup tureen, out of which they all ate together.

Their last improvement was to manufacture a sort of wooden trencher for themselves, when they ate comparatively in a superior style of comfort. In the soup they sometimes put elephant skin, which had the appearance of tripe, but in taste and substance it is described as of a more "leathery" nature. After dinner some of them went out again to hunt for "grub," some remaining at home, the swiftest runners being chosen to hunt the seal. At "tea-time," or dusk, they returned, and partook of a mess composed of penguins' eggs boiled in water. Now and then they killed the albatross, which is rather a strong bird, and roasted it; but as the young ones were highly esteemed, and as the mariners daily began to lose their hope of being delivered, they were afraid to kill the old birds lest they should quit the island, and in this fear they permitted them to live as "stand by's." For the same reason they spared the penguins, which supplied them plentifully with eggs. The young seals were considered as the greatest luxury, but they, as well as the old ones, were but too scarce, and their skins were in high request for clothes; for, at the end of a few months, from their mode of life, their clothes gave way, and, indeed, the climate was so cold and wet that they were not fit to withstand the inclemency of the weather. The men set to work and made themselves clothes of the seal-skin, some using the hair inwards. They made a needle out of a nail. For shoes they made themselves a sort of socks or buskins of the same material, and they constructed various kinds of caps, which, as their beards were pretty long, by no means tended to improve their physiognomy.

We now turn to the history of the party of eight men who had gone ashore on the first island in the group, and from which they expected to be taken up in the course of a week. During the week, for which they possessed a sufficiency of provisions, they pursued their occupation of hunting the seals on the low sandy shores and inlets, and gathered a large quantity of the skins of these animals to carry with them on their return. At the end of the week, however, the smack did not make its appearance, which perplexed them not a little; but their distress may be conceived when they found portions of the wreck driven ashore by the waves, giving too certain evidence of the destruction of their vessel, and, as they feared, of the loss of their comrades. For six weeks they continued to watch the horizon, with a lingering hope that a sail would present itself to their anxious gaze, but nothing of the kind appeared, and the party then removed to another quarter of the island more productive of animals for subsistence. At the spot selected, the eight seamen staid during the winter, living on seals and sea-elephants, which they also cooked by means of the blubber. When winter had passed away, provisions were found to be scarce, and there was a necessity for seeking new quarters. As the small boat was left to them, they proposed to sail to the island lying at the distance of ten miles where the smack had been wrecked, and, putting this design in execution, they landed, as it happened, close by the spot where their wrecked shipmates had built their house, and there they met, to the great joy of both parties. The fishing party added to the comforts of the establishment, by bringing with them their kettle, frying-pan, and some other implements, which were highly acceptable. There was now a more numerous party to be

§ Phil. Trans. 1774, p. 472.

provided for on the island, and consequently additional exertions were necessary for procuring food. Hunting the seal, the sea-elephant, and various birds, was kept up as all times when the weather permitted; and when storms of rain, snow, and wind, swept across the island, and rendered it impossible for them to move out with safety, they remained shut up in their rude dwelling, in which their only mental solacement consisted in reading a bible that had been fortunately spared among the materials of the wreck. Influenced by pious and rational sentiments, they formed a peaceful and orderly community, such as is seldom witnessed in similar cases of extreme personal inconvenience and privation. During their sojourn on the island, there were no parties amongst them; no quarrelling, and none assumed command, but obedience of the best kind existed—namely, that produced by a conviction of the utility and propriety of the thing proposed, and a mutual desire to be serviceable. They all gave their utmost exertions to the execution of whatever was suggested by the most experienced, or received the sanction of the majority.

After they had been together for about three weeks, and the prospect of deliverance from the dreary solitude getting every day more remote, it was proposed to construct a vessel with the timber of the wreck, and the materials of which the house was built. There were the remains of a hut built on the other island by some Americans who visited it some years before, when seals were more plentiful. With these, and what had been saved from the wreck, the carpenter reported that a vessel might be built, and they set to work upon that object immediately. The sails were to be made of seal-skins sewed together, and a party, consisting of eleven, went to the first island, for the purpose of collecting and preparing them, and digging up the timber which had been used for the house. The collection and preparation of the skins took three weeks, and in a week more they collected all the timber for the building of the vessel. From the state of their provisions, it was found convenient that five of their number should return and stay at the other island, as there were not provisions sufficient for the subsistence of all at the island where the house was built. This party, therefore, having received a proportionate share of the utensils, namely, one kettle, and the bottom of an old one, which was used as a frying-pan, they set off. Those who remained, in order that they might apply the timber used in constructing the old house to the building of their vessel, set to work to build a new habitation, which they formed chiefly of stones and turf. This house appears to have been an improvement on the first, inasmuch as it had the luxury of three chimnies, which, however, either would not draw, or were insufficient, as the inmates were obliged to cut a hole in the gable end to let out the smoke. At this time they used the elephants' bones, with the blubber as fuel, the fumes from which were by no means agreeable. Having finished this, they shifted their things into it, tore down the first, and then cleared the place where it stood, for the purpose of building the vessel upon it. They laid the keel, made from the topmast of the wreck, to erect a vessel whose keel should be twenty-nine feet, and built like a lugger, and of about four feet and a half high. It was calculated that she would be about twelve tons burden. They worked at it with assiduity, animated by the hope of delivering themselves. Their history of their various expedients to supply the place of regular tools and materials, though unintelligible to the general readers, would be highly interesting to nautical men. At the end of five months they had completed her with her seal-skin sails, and they set off to the other island to fetch the other five men, that they might assist in the launch.

Nearly two years had passed since they were wrecked—a time which, as marked by their privations and anxieties, appeared as long as their lives. The five men who were on this first island were dispersed in search of food, and the larger party were obliged to go in pursuit of them. On the next day after their arrival, a gale sprang up, and their boat was driven about seventy yards from where she was made fast, and her stern knocked to pieces. This was a fearful disaster, which threw the party into dismay, yet, out of evil, good sometimes comes. The day being fine, an old man, one of the sailors, was sent to a mountainous point to try if he could discover their comrades, and he had not been long gone ere he returned in a bewildered breathless state. When able to speak, he informed them that he had seen a vessel standing in towards the shore. This none of them would believe, and all said it must be a bird sitting on the water, an object which had often deceived their hopes. The man, however, was convinced that he was not mistaken, and asked who would go with him to see the vessel, when one offered to go with him, and ascertain the fact; and a tinder-box was given to them, that they might, if it were true, make a fire to show those on board that there were human beings on the island. To their indescribable joy, these two men, on getting to the place where she was first discovered, saw a schooner standing along shore, and, from the carcass of a sea-elephant, just killed, and other traces, perceived that the crew must have been on shore. They then sought for and killed one of those animals, and with its blubber they soon made a fire on the promontory, that evidently caught the attention of the schooner, as a boat was seen to proceed from her towards the shore. The men ran down eagerly to meet her, but when the boat got near the shore, the crew evidently hesitated, on seeing the two men, whose appearance must certainly have been of a dubious nature. They were naked,

with the exception of their rough brown fur jackets, as they had thrown off their skin trousers, which were exceedingly thick and heavy, for the convenience of running. They, however, hailed the crew, in a manner which proved them to be civilised beings, and they were taken on board. The vessel turned out to be an American schooner, which had come for the purpose of sealing and trading in those seas. The captain received them kindly, and gave them shirts and trousers. It was sunset when they were taken on board, and the next day the captain and the remaining party were fetched. They proceeded in search of the other party, who deserted the vessel with a degree of joy equal to that of the first man who saw it, and on the boat approaching the shore, hailed it with three cheers, which were returned by their comrades on board. Those on shore were so overjoyed, that they did not wait for her coming to shore, but rushed into the water to haul her up. They were all taken on board. They assisted the schooner in loading, and after taking all their things on board, she sailed for her destination, the Isle of France.

Although thus rescued from a desert island, the misfortunes of the party were not terminated. On the way to the Isle of France, the mate of the smack had a disagreement with the American captain, and he and his companions, three excepted, were at their own desire put ashore on the island of St Paul, where there are plenty of wild pigs and provisions such as the mariners had been lately used to, and which island is in the track of the vessels trading in the direction of the Mauritius. Here they intended to wait till picked up by a vessel in passing, of which they had no apprehensions. Of their fate no further account is given, though there is little doubt that they soon after reached England by some trading vessel. The three men that preferred going on with the American schooner, were landed at the Isle of France, whence they found their way to the Cape of Good Hope, and from that they returned to London in the Lord Exmouth, in a most destitute condition, but in good health, notwithstanding the straits and miseries they had undergone.

THE NEW YEAR OF 1812, AN EDINBURGH FIRESIDE STORY.

IMMEMORIAL usage has dedicated the first and last days of the year in Scotland to mirth and festivity, but those who have only witnessed such celebrations at the present day can have little idea of the character which they assumed in the Scottish capital some twenty or thirty years ago. A sort of licence seemed to be given, for the time, to every species of disorder and misrule. The authorities forbore in a great measure to exercise their usual control over the city, and its streets were taken possession of by the populace, who frolicked about them like some wild animal let loose from its bonds, and committed unrestrained outrage on every peaceful inhabitant whom necessity or any other cause called abroad during this "reign of terror." Such occasions never passed away without serious crimes and accidents; yet, year after year, the same scenes were permitted to recur, the whole affair being regarded, seemingly, as a mere exhibition of boisterous mirth, excusable on account of the season which had called it forth. The events, however, of the New Year's morn of 1812, were instrumental in producing a change in these views, and in leading to the adoption of measures, which, with the help of other causes, abolished by degrees this evil custom, leaving it but to be the subject of a fireside tale.

About eleven o'clock of the last night of the year 1811, the annual disturbances commenced, and soon reached a height unprecedented even on these riotous occasions. Bands of young men, chiefly apprentice boys, armed with bludgeons and other weapons of offence, infested the principal streets of the city, which, as usual, were crowded with boys and other persons, whose only object was to partake of the ordinary diversions of the night, and enjoy the "fun" and noise which always prevailed. The bands alluded to had more mischievous purposes in view, and were certainly, to some extent, organised for the occasion. They, as it afterwards appeared, had arranged a methodic plan of assaulting and partially robbing or stripping the passengers on the streets, both male and female, and of carrying off the plunder as it was gathered to an appointed depot. One part of the plan consisted of posting brigades of lads across several main thoroughfares, so as to intercept all who passed these spots, and enclose all who were within them. Thus prepared and secretly marshalled, this daring association of juvenile rioters, as the signal of twelve o'clock was struck on the city clocks, burst forth into activity on all sides. The hilarious citizens, unsuspecting of evil, were in a moment attacked by unknown hands, while the police, equally unaware of the plot, were driven from their posts, and in some instances severely injured. One unfortunate officer of the corps, named Dugald Campbell, was the first victim of the night. On being attacked, he fled from his assailants, but was pursued and struck down on the High Street. The unfortunate man cried for help; no help, however, could be extended to him. He was struck and kicked when on the ground, till past all human aid. He was afterwards removed to the Royal Infirmary, where he died in a day or two.

It is said that a single tasting of blood will make the tame tiger wild, and so it appears to have been with men on this occasion. The rioters now assaulted every

respectable person to be seen on the streets, struck them with bludgeons, and robbed them. The uproar grew terrible beyond conception. With that strange passion for flocking to all scenes of disturbance, so often exhibited by people in spite of risk and danger, crowds of spectators remained on the streets, and thus afforded a screen, under cover of which the rioters went on with their work. The police and magistrates made active exertions to check the mischief, but could not, although they succeeded here and there in capturing single offenders. Numerous were the cases of severe injury inflicted on persons who had the misfortune to be abroad that night. Cries for "help" and "mercy" mingled in all directions with the roaring of the mob. One ill-fated person, Mr James Campbell, a clerk in Leith, was so seriously wounded as to die a few days afterwards. But these were not the only instances where injuries, ultimately fatal, were received. Many of the respectable inhabitants of the city were engaged, according to custom, in celebrating the occasion, along with parties of friends, in their own houses. The sounds of riot reached the ears of these convivial assemblages, and they sat trembling at the board, with locked and bolted doors. A friend of ours remembers being in such circumstances on the night in question, in his house in the High Street, when suddenly a noise was heard at the door of the dwelling, and a man's voice cried for "admittance and shelter in the name of God!" The door was opened without a moment's delay, and a gentleman burst hurriedly into the house. The door was shut again instantly, for the rear of the mob was heard below. The intruder presented a pitiable spectacle. He was stained with blood from some severe wounds, his dress torn off him, and every part of his appearance, indeed, betokened the violence which he had sustained at the hands of the mob. The irruption of such a figure into the midst of a convivial party was strangely impressive and alarming, but every attention was paid to the unfortunate sufferer, who was faint and exhausted. He was kept till a period of safety, and sent to his home. Though his name was not publicly enrolled in the number of the victims of this New Year's celebration, it might justly have been so, as the wounds which he had received brought him to a premature grave.

Many other individuals were seriously hurt, as has been said, and many robberies committed, in the course of the rioting, which extended far into the morning of the 1st of January. It was remarked by many persons that among those of the mob who seemed to act with something like concert, one youth was regarded as a leading party, being frequently addressed by the title of *Boatswain*. A peculiar whistle which he emitted, and which drew his associates around him, appeared to be the source of this name. Doubtless, however, many of the assaults and crimes which signalled this night, were committed by persons who knew nothing of the Boatswain or his whistle. Be this as it may, when the rioters had wearied themselves, or thought it prudent to come to a close, and when the crowd had in a great measure dispersed, the police found in their hands a number of offenders, but few or none of the ringleaders. When daylight came, and men could walk the lately disturbed streets in quietness, the amount of mischief done to person and property was found to be even greater than had been anticipated in the fears of the night. Creech, the well-known bookseller, then Lord Provost of the city, immediately issued notices, offering a reward of one hundred guineas to any persons who might bring the leaders in the riot to justice. A similar reward was offered for the discovery of Dugald Campbell's murderer or murderers. The whole city was deeply agitated by these disturbances. All the incorporated trades, and other public bodies, met successively to express their detestation of these occurrences, and to aid the magistracy in discovering the offenders, as well as in organising measures for the better preservation of the peace of the town in future. All possible steps were taken in the first instance to find out the rioters.

Some few days after the New Year's day, a young lad, about eighteen or nineteen years old, came to the village of Innerleithen, and sought employment as a shoemaker from a tradesman in the place. The young man's request was granted, and he remained in the pursuit of this employment up to the 10th of February. He was a stout lad, decently dressed, and very peaceable in his behaviour. But on the day just mentioned, a large and portly personage, of middle age, entered the village of Innerleithen in a carriage. Though every boy within the precincts of Edinburgh could have named this personage, the villagers knew him not. But his character and purpose were soon made apparent. He asked for the shoemaker's house, went to it, and on entering found the new-come workman seated at his labour. A horrible moment this must have been for the unfortunate youth, for he knew the person before him but too well. The visitor was Archibald Campbell, long the principal officer of the city of Edinburgh; and the person he came to seek, and found, was the reputed ringleader of the rioters—the *Boatswain*, for whose apprehension a large reward had been offered. The young man was taken into custody, and soon after was on the way to Edinburgh. In that rural district, where crime or exciting incidents of any kind are of rare occurrence, the capture of the miserable youth was long vividly remembered.

Hugh Macdonald, as the Boatswain was properly

named, had been for some time a sailor before he became a shoemaker. Previous to his capture, his cousin Hugh Mackintosh, also a shoemaker, and Neil Sutherland, a painter, both of them lads of sixteen or seventeen years of age, had been seized at Glasgow, along with a considerable quantity of valuable property, which they had conveyed thither after the riots, and which was the fruit of the robberies on that occasion. On the 20th of March, these three young men were put on their trial before the Justiciary Court, for the murder of Dugald Campbell, and for eleven distinct robberies, accompanied with violent assaults of the person. They pled not guilty; but a large body of evidence was adduced, which, in addition to the heavy testimony afforded by the stolen property, brought home to the prisoners a great portion of the guilt involved in the accusation. One witness, John Tasker, who had been an associate of the prisoners, and who had become king's evidence, gave an account of the origin of these riots, which may well furnish a warning lesson to young trades-lads in large cities. Tasker said that he and the prisoners belonged to a set of lads who used to meet twice or thrice a-week at the foot of Niddry Street; that they used to "pick quarrels" with people, and strike them, but "never took any thing" from them; that the gang had a particular whistle for a call, and used to be called the "Keelie Gang;" and that, some weeks before the New Year, he heard of a "plan to give the police a licking," particularly some members of the body, who had sometimes chased the gang off the Bridge.

Here, then, in these street meetings and street resolutions, we have the germ of the misfortunes which fell on these poor boys, made them robbers, if not murderers, and brought them to an infamous end in the spring of their days. The only hint which Tasker had heard before New Year's day about robbing, consisted in the expression of some member of the gang, who declared that he "would have a good hat," but this might only imply that he would endeavour to pick up one, if any fell off in the disturbances common to the evening. Nevertheless, whatever might be the thoughts with which these lads had begun the riots of the night, it was made plain to the jury which tried them, that they had become robbers, at least, before its close, and the verdict of "guilty" was brought against them. They were sentenced to be hanged on the 22d of April, and on that day the sentence was accordingly carried into execution. Before their death, the three youths admitted their participation in the outrages and robberies of the evening. In the striking of Campbell the police-officer, many had borne a share, but the main guilt appeared to lie on an individual who had escaped capture. The extreme youth of the three lads rendered them the object of the greatest commiseration.

It was intended by the authorities of the country that the fate of these young men should be a memorable example, in the time to come, of the danger of violating the laws in a similar way. We have pointed out circumstances in this case which may afford a warning to other youths, but there are other points in it which may not be undeserving of notice. In part, the deaths, as well as errors, of these poor boys were certainly owing to the senseless custom which had half licensed disorder at the period in question. It is quite possible, or rather probable, that the masters of these boys may have set the stone of mischief a-rolling by treating them, in honour of the day, with liquors of no peace-begetting kind. This practice was almost universal in Scotland once; nay, it is still followed, though much less extensively. The condition of Edinburgh now, on a New Year's morning, forms a pleasing contrast to the scenes described here. To a certain extent, no doubt, the sad consequences of this very evening were of avail in producing this change; but we are inclined to attribute the decrease of New-Year follies and outrages to other causes, also, of a more pleasing and worthy kind—to the growing intelligence and increasing refinement of the community at large. The extinction of the very odious practice of "first-footing," as it is called, was, however, only one of the benefits which Edinburgh derived from the above-mentioned riot. Such an extraordinary and unforeseen outbreak of mere boys and lads astonished the respectable citizens, including the various public authorities, in no small degree. Attention was for the first time drawn to the fact, that there was a large juvenile population growing up in the town in a state of complete ignorance and barbarity. Shocked with the disclosure, plans were new devised for improving both the moral and physical condition of the humbler orders of society; in particular, a school on a comprehensive scale was set on foot by the aggregate kirk sessions, called the Sessional School, an institution which has done much good in its day, and still exists under the philanthropic care of Mr Sheriff Wood; the Lancasterian schools were likewise brought into vigorous operation in the town. The first spur given to social improvement in the Scottish metropolis, and thence to that of the country around, is, therefore, in some measure to be traced to what is now the subject of a fireside story—the New Year's riot of 1812.

AGE OF THE GLOBE.

In a conversation with Dr Lardner, stating how much we were indebted to the discoveries in geology, demonstrating the antiquity of the earth, he replied, that we need not resort to geology to prove the fact: for, as it regards the creation of the heavenly bodies, it could be

proved that the fixed stars are at such an immense distance, that, notwithstanding light moves at the rate of a hundred thousand miles per second, it would take three hundred thousand years for a ray of it to travel through space ere it reached the earth; so that the stars we now see must have been created more than three hundred thousand years ago.—From a new work, "Pleasant Recollections of a Dilettante, by William Gardiner."

A BALLAD OF SIR RICHARD FANSHAWE.

[This ballad is but a metrical version of an anecdote related by Lady Fanshawe in her Memoirs, though the writer there bestows no such panegyric upon her own conduct as is here contained.]

A goodly ship of English mould rode forth upon the main,
To waft across a famous knight unto the shores of Spain;
Sir Richard Fanshawe was the name this noble pilgrim bore,

And he might veil his cap to none for valour, wit, and lore.

Along the seas this ship had sailed a fortnight and a day,
When suddenly unto the knight the captain he did say,
"Draw forth thy sword, thou warlike lord! The Turks
be on our lee!

Draw forth thy sword and strike this day for England
and for me!

Stand to your guns, my sailors all! the Moslemah are
nigh,

Right well on yonder corsair's mast the crescent ye may
spy!

Though twice our metal she may show, fight as ye aye
have done,

And England shall the tidings hear of a battle this day
won!"

The stout Sir Richard waved his sword above his head
in air,

And cried, "where'er the press may be, sir captain, place
me there!

And ere this morning's sun go down, God willing, thou
shalt see

A good blow struck for Jesu Christ, for England, and for
thee!

But go, thou little page, unto my lady's cabin door,
And bear to her my wish that she come not that thresh-

old o'er;

Commend us to her gentle prayers, and bid her have no
fears,

For heaven will surely bow these hounds before the
Christian spears.

Yet, as I know the mighty love that fills my lady's heart,
Let this amid the melody be, thou youthful page, thy part:

Keep true and faithful watch and ward that chamber
door beside,

And see that by this heat of mine my lady-love abide."

The page bowed low and left the deck—the good knight
sought the post,

Where danger from the Moslem arms appeared to threaten
most;

And there he stood amid the crew, all ready for the fray,
From noon-tide till the sun passed through the folding-

doors of day.

Meanwhile, although the foe hung o'er the Christian
vessel's path,

A distant dropping shot was all that showed their hostile
wrath:

The unbelievers knew that oak, and where it sprang from
earth—

They knew the mettle of the men to whom that soil gave
birth!

But prudent, as in battle bold, the English captain was,
And still he kept his men prepared for aught might come

to pass;

On deck, with them, Sir Richard stood, ev'n till the
morning light

Appeared to show no danger near—no crescent-flag in
sight.

'Twas then the good knight turned to look upon a boyish
form,

That through the long, long hours of gloom was ever at
his arm—

"Good Lord!" exclaimed the knight, and prest that form
in fond embrace,

"What change—what miracles can through the strength
of love take place!"

It was, indeed, his lady fair—veiled in the boyish dress,
Of which her prayers had won the page himself to dis-

possess—

'Twas she who, thus attired, had crept to where her lord
was placed,

And there, unknown, had stood till dawn shone o'er the
watery waste.

Well might the husband fondly cry, "what changes love
can make!"

Whose lady braved the cold, the foe, the darkness for
his sake—

Though peril she could not avert, yet peril she might share,
And if a bullet sought his heart, her own might meet it

there!

Well might the noble knight exclaim, "what wonders
love can do!"

When strits its influence in the breast that tender is and
true!

The gentlest heart Love maketh bold, the wildest it can
tame,

In weal or woe, with high and low, its power is still the
same.

A place Sir Richard Fanshawe hath, high on the roll of
fame,

And not less bright the halo is, that girds his lady's name:
Kushrued together in the breasts of all the good they lie,
Amid the glorious company whose memory cannot die!

THE KEY OF DEATH.

In the collection of curiosities preserved in the arsenal at Venice, there is a key, of which the following singular tradition is related:—About the year 1600, one of those dangerous men, in whom extraordinary talent is only the fearful source of crime and wickedness beyond that of ordinary men, came to establish himself as a merchant or trader in Venice. The stranger, whose name was Tebaldo, became enamoured of the daughter of an ancient house, already affianced to another. He demanded her hand in marriage, and was of course rejected. Enraged at this, he studied how to be revenged. Profoundly skilled in the mechanical arts, he allowed himself no rest until he had invented the most formidable weapon which could be imagined. This was a key of large size, the handle of which was so constructed that it could be turned round with little difficulty. When turned, it discovered a spring, which on pressure launched from the other end a needle or lancet of such subtle fineness, that it entered into the flesh, and buried itself there, without leaving external trace. Tebaldo waited in disguise at the door of the church in which the maiden whom he loved was about to receive the nuptial benediction. The assassin sent the slender steel, unperceived, into the breast of the bridegroom. The wounded man had no suspicion of injury, but, seized with sudden and sharp pain in the midst of the ceremony, he fainted, and was carried to his house amid the lamentations of the bridal party. Vain was all the skill of the physicians, who could not divine the cause of this strange illness, and in a few days he died. Tebaldo again demanded the hand of the maiden from her parents, and received a second refusal. They too perished miserably in a few days. The alarm which these deaths, which appeared almost miraculous, occasioned, excited the utmost vigilance of the magistrates; and when, on close examination of the bodies, the small instrument was found in the gangrened flesh, terror was universal: every one feared for his own life. The maiden, thus cruelly orphaned, had passed the first months of her mourning in a convent, when Tebaldo, hoping to bend her to his will, entreated to speak with her at the grate. The face of the foreigner had been ever displeasing to her, but since the death of all those most dear to her, it had become odious (as though she had a presentiment of his guilt), and her reply was most decisive in the negative. Tebaldo, beyond himself with rage, attempted to wound her through the grate, and succeeded; the obscurity of the place prevented his movement from being observed. On her return to her room, the maiden felt a pain in her breast, and uncovering it, she found it spotted with a single drop of blood. The pain increased: the surgeons who hastened to her assistance, taught by the past, wasted no time in conjecture, but cutting deep into the wounded part, extracted the needle before any mortal mischief had commenced, and saved the life of the lady. The state inquisition used every means to discover the hand which dealt these insidious and irresistible blows. The visit of Tebaldo to the convent caused suspicion to fall heavily upon him. His house was carefully searched, the infamous invention discovered, and he perished on the gibbet.—*New York Mirror.*

DR KAY'S TABLES

RESPECTING THE INCOMES OF 539 AGRICULTURAL LABOURERS, REFERRED TO IN THE FIRST ARTICLE OF THE PRESENT NUMBER.

	Average number of children in a family.	Average annual income.
36 single men	L.25	1 44
64 married men, with no children at home	30	12 104
166 whose children were all under 10 years of age	2 7-8ths	32 13 2
120 with 1 child above 10 years	3 7-10ths	35 9 08
92 2 children above 10 years	4 9-10ths	40 10 1
44 3	5 3-4ths	45 11 94
15 4	7	50 18 6
1 5		49 13 0
1 6		52 0 0

The average earnings of the wives of the married labourers were as follow:—

	Average number of children in a family.	
34 cases in which there were no children	L.3	8 9
71 all the children were under 10	2 7-8ths	2 9 04
64 1 child was above 10	3 7-10ths	2 11 72
49 2 children were above 10	4 9-10ths	2 5 71
20 3	5 3-4ths	2 19 1
3 4	7	2 3 10

241 Total. Total annual earnings of all, L.633 13 7
Average of each, 2 12 7

The earnings of the children were:—

	Average number of children in a family.	
25 cases in which all the children were under 10	2 7-8ths	L.3 4 0
76 1 child was above 10	3 7-10ths	4 6 14
82 2 children were above 10	4 9-10ths	8 17 41
41 3	5 3-4ths	12 17 0
13 4	7	20 3 84
1 5		10 6 0
1 6		18 0 0

239 Total. Total annual earnings of all L.1933 11 5
Average of each family 8 1 10
Average of each child 1 17 1

In families in which the average number of children was 2 7-8ths and no one was above 10 years of age, the average earnings of each child was L.0 15 34.

STORIES OF THE IRISH PEASANTRY.

BY MRS S. C. HALL.

"Mind not high things: but condescend to men of low estate."
ST PAUL.

THE LANDLORD ABROAD.

It was a bright, yet a weeping morning—the sun was shining, but thick heavy clouds flitted across the heavens, sometimes softening, sometimes altogether obscuring its rays; the birds were singing cheerfully in the hedges, whose leaves bent beneath the rain-drops; and the poultry in Widow Clement's little yard were shaking the moisture off their wings.

"Look at that beautiful Norah," said the widow to her daughter Peggy, Norah being a favourite hen of snowy plumage; "she's just as fretted at the feathers being wet upon her, as you'd be if Paul Kinsala saw a dirty handkerchief—"

"Lave off, mother," interrupted the daughter, blushing, and turning her wheel with such increased velocity that the thread snapped; "lave off—what's Paul Kinsala to me?"

"Och, Peggy, for shame, to be throwing sand in yer mother's eyes!" exclaimed the widow.

"Throwing sand in yer eyes, mother darlint, eh!—then the girl's not born yet that could do that, I'm thinking. Well, mother, if I have a kindness to him, sure he's well to do."*

"He was well to do, Peggy mavourneen; but the lase of his farm, little as it is, and high as the rent was, is out."

"But sure the agent, Mr Crumbie, heard my Lord promise him a renewal, and a taking off of three pounds in the year, on account of the improvements he made."

The widow shook her head—those who grow old in the country learn to understand human nature as well as those who read the more varied page of town life. "He never said he *wouldn't* grant the renewal," continued Peggy, looking anxiously in her mother's face.

"He never said he *would*," was the reply. There was a long silence. Widow Clement sighed, and continued her knitting. Peggy did not sigh, but she went on spinning, as if nothing had been said to give her pain; but her mother noted the heaving of her bosom. Twice she rose under pretence of seeing if the grey hen who was seated upon her eggs in a corner was covering them as she ought; her mother knew she moved to conceal her tears. "Peggeen gra, never heed the hen; the nature's in her to manage her eggs herself, and looking at her only disturbs her; it's an *insult* to her, Peggy, and we mustn't hurt her feelings. Sorra a finer hen in the parish afther a brood than that same grey-malkin, as the darlint young mistress used to call her. Why, thin, Peggy, I often think I'd like to see Lady Ellen in the court at London, foreint the king and queen, and all the grandees looking at her. I'll go bail she takes the shine out of them all!"

"I dare say she does," replied Peggy; "I don't doubt that; but sure it would be fitter for his lordship to come and stay among his people, in the country where his forefathers' bones makes part of the soil, and where the grass grows, the corn ears, the water flows, the cattle dies, all for him, than to be laving those that's bred, born, and reared under him and his, for I don't know how many thousand or hundred years, to the bitter wrath of an agent, and all belonging to him. And what's the upshot of it all?"

"Heart trouble, a-lannan; and discontent even when there's no reason; like all the mimbers fighting one another for want of a head—that's what it is!"

replied the widow sorrowfully. "The nature of man and beast is not to be put upon by its equals, and the landlord could do more with us than another, for he's the protector placed over the land to see justice done to his dependents." The widow paused; her reasoning was the reasoning of a class more numerous formerly than at present—a class of well-disposed affectionate persons, who looked up to their landlord as a friend and counsellor in all trouble: it is a pity such confidence should ever be misplaced. The absentee landlord knows but little of the affections or feelings of his tenants, and, it is much to be feared, cares less. After a moment, Widow Clement resumed—"And yet, sure, when we pay our rint, and are honest, we can stand as straight before God as the landlord himself."

"And straighter," added Peggy, smiling.

"That's a bright girl, Peggy; it joys my heart to see the smile in yer eye, my own girl! Sure when the Almighty gave me you and your brother, He let fall a blessing from each hand; praise be to His holy name! It's little we have to complain of ourselves, though the family is in furrin parts—Mark, being my lord's groom, is on the spot to take care of us—but it's for the neighbours' my heart bleeds. The cottages that in the ould lady's lifetime war the admiration of the country, are falling to decay; the pigs that used to be kept to themselves, are free of the roads again; many have turned their face from their people's graves, who couldn't pay the rack-rent; the sorra a thing thrives in the place, Peggeen gra, but the whisky-shops and boys,* that I remimber quiet and industrious whin the lord was in it, and kept the improvements going on, and more than a hundred men at them winter and summer; them very boys, that never handled a shillala, barring at a fair, or for a bit of sport at Shrove or Martinmas, are in constant practice with it now, wheeling through the country by day, and not trusting to sticks only at night."

"Hush, mother!" exclaimed Peggy; "least said soonest mended. Only I wish Lady Ellen was in it again, like a sweet moss-rose as she always was. It's not the same place since the people war turned over to strangers;" and Peggy sighed bitterly as she spoke.

This was true; the old Lady Killbally died, leaving no heir to the property, and but one fair daughter, the "Lady Ellen" whom Peggy sighed for. Lady Killbally had been a blessing to her tenantry; but after her death his lordship imagined he required change of scene for a longer period than usual—indeed, he generally spent one or two months of every year in England, and returned with new ideas and new plans for the improvement of his hereditary estate. Alas, and alas! he did not mourn long. Before the twelve-month was expired, he had married a woman of fashion, who had no idea of reciprocal duties between landlord and tenant; and though she visited Killbally, it was evident she would not reside there.

Lord Killbally made a speech at the county town, previous to quitting the country to "winter" in London, full of the most sublime sentiments of patriotism; he had never talked about it before: he recommended his new agent, a stranger, to the friendship of the gentry, as if friendship, even in warm-hearted Ireland, grew on the furze bushes, and could be pulled off and appropriated at pleasure; and he begged of his tenants to respect the laws—as yet, they had never been violated in his neighbourhood.

"Where's the good of behaving as we have done?" said the Killbally smith, and a party of loose-coated Irishmen gathered round him as he spoke; "where's the good of behaving as we have done! We never

gainsaid him; we never riz a ruction at fair or pattern for fear we'd displace him. We paid our rint, when we had it, regular; and when we didn't, why, he was never cruel on us. We never voted agin him; we sent all our children to get the larning at his, or Lady Ellen's schools; we planted trees; we kept up our pigs; we made back-doors to our houses; we took oaths agin the whisky—and all to please him. Our prayers were hearty on him, yet he'll go from us, boys—he'll go from us, and lave us a black-a-riced agent, a stranger to our hearts and homes, who doesn't understand us, nor we him—he'll go from us, as the good, the dear ould, and the purty young, lady did. He'll melt off like snow in summer; he'll go from us, and keep from us; he'll be an absentee; he'll forget to feel for us. Mark my words: for all this fine talk, in three months the workmen will be discharged; there'll be no traffic in the place. God help poor Ireland! She's ever and always treated as Barney Barret treated his cow—fed on thraneens, and then abused for giving poor milk. 'How can I help it,' says the cow, 'with the usage I get?' 'Bad scram to you,' says Barnaby; 'sure the strength is in ye; and it's a compliment I pay you, you ignorant baste, to expect more from you, though you are fed on thraneens, than from any other cow that would be fed on clover.'" The thoughtless laughed at the simile, but the thoughtful shook their heads, and returned in silence and solitude to cottages which, if doomed to live under an absentee landlord, they might soon be despoiled of.

The agent was certainly an unfit person to have been placed over such a tenantry; he was full of new systems, and if they did not immediately work well, he became harsh and impatient. Paddy likes to go on in the old way; if his father had a dunghill at the door, it is a difficult matter to convince him that it could be more advantageously disposed of elsewhere; and he has a most provoking habit of saying, that whatever he does in the way of improvement, is done to "please" the landlord, or the "clergy," or any one but himself, though all the time it is for his own benefit those who have his interest at heart have persuaded him to change his plans. Then Paddy is so full of humour, real genuine humour, that he will lean his back against the door-post, between which and the wall a deed of separation, by mutual consent, has taken place; put one foot over the other, take his "dudeen" out of his mouth, fold his arms across his ample chest, and beguile you from the intention of giving him a good lecture both on the management and mismanagement of his farm, until you wish him good evening, enjoying the remembrance of the raciness and humour of his stories, and the mirthfulness that shakes his rags with laughter. It is not till after you sit down to your reading-table that you think how completely you were beguiled of your wisdom! An Irishman loves a jest, and likes to laugh—and Mr Crumbie, the agent, never laughed; he had a long business-like face—looking as an Englishman always does when he has been waiting three quarters of an hour beyond the usual time for his dinner. He had served three years in an attorney's office, and never regarded any thing as binding that was not binding in law. It is to be hoped, for the sake of sweet charity, that he meant well; but certainly he acted ill. His wife was a rigid sectarian, believing, in her heart of hearts, that all who did not think exactly as she did must be in error. She made hard bargains, and gave low wages; in short, she was a very unfit person to preside over the people in the place of the "ould mistress." A spirit of discontent of the most alarming kind was abroad. Lord Killbally had managed, with a skill peculiarly Irish, to "spend half-a-crown out of sixpence a-day;" that is to say, he was deeply in

* Well off.

* This term means all unmarried men, no matter what their ages.

debt; he had overstepped his income, and wrote constantly to the agent to obtain fresh supplies, when, in fact, there were none to obtain. Matters had arrived at this crisis—the landlord driving the agent, and the agent the tenant—when my story commences. The widow and her daughter continued their conversation a little longer, and would have talked till evening, had not the sight of the postman, on his old grey pony, wending round the distant hill, and then entering the bohren that led to their cottage, sent both mother and daughter to meet him, in the hope of receiving a letter from the hope of the family, Mark Clement.

The expected letter was instantly produced, the postman took his departure, and Peggy, being what is called "a fine scholar," was able to peruse it for her mother's benefit. It was a curiosity in its way, remarkable for acute and affectionate feeling.

"DEAR MOTHER AND SISTER—My love goes with this paper, and my blessing, and all my prayers, which you're never out of, nor never will be—why should you!—Amin! It's long ago I'd have written again to you all, but indeed I haven't much heart to the pen, let alone the time, which bewilders me the way it flies, and no good of it. It's four years three quarters, my blessed mother, since I saw you; and often in the night, or rather the morning—for morning's night here—often do I think you are at my bedside; often do I hear yer voice in my dreams; and when I wake, it isn't your voice at all, but little Anty Maguire, the milk girl, calling "milk below" down the aircoes, when it's milk *above* she means; and very quare milk it is; but that's not Anty's fault, for it's ready watered before she gets it.

Well, the only real pleasure I have almost is, when Lady Ellen of a day she rides out with my lord, says, "Oh, Mark, when did you hear from your mother? and is Peggy quite well? and how is Grey-malkin?" ["Think of that!" interrupted the widow; "think of her remembering the hen!"] But, mother, Lady Ellen doesn't ride as often in the Park as she used, on account that the mare stumbled, and I know the master didn't find it convenient to buy her another, though she lets on to her maid she's tired of the exercise. Ah, poor lady! that's not the only trouble she puts up with. Ye see, when first we came over, and had lashings o' money, and the master, poor gentleman, thought, because his wife was young, he was young too, it was all very fine; and my Lady Killbally here, and my Lady Killbally there, and my Lady Ellen every where, and an acknowledged beauty, only even then, a taste of pulling to pieces on account of her brogue, or being Irish. ["Think of that!" exclaimed the widow, indignantly.] And offers she had, as I told you before; but the money stood in the way, or rather it was out of the way, for it wasn't in it, on account that the property is entailed on the heir-male, master's nephew, and poor Lady Ellen will have hardly any thing, barring master's blessing, and that she earns hard enough, for of late he bates Bannagher with the crossness; and small blame to him, poor gentleman, to see the way he's looked down upon, now that it's known he's only an Irish peer in embarrassment, which means debt and danger. There's no decent Irish property could stand up to cut a figure here. With the Irish it's all going out, and too proud to do any thing to bring in; but with the English, why, if they give out with one hand, they grapple in with the other; very few, indeed, to say above their business, only work all, and tradesmen worth tens o' thousands. I can't but think it's the best plan, which you want, I know, only you don't know any thing of the hardship of wanting to appear grand and show off when you've nothing to do it with—like the girl we remember who turned her cotton, to make the neighbours believe she'd two gowns, when she was trusting to one. Well, that's the way we've been many a long day, making the one thing appear two, and my mistress without a head, or, what's worse in a woman, without a heart; and, och murder intirely! to hear the sneers and the alurs that's put upon them—tradesmen's bills unpaid, and bills having been passed to them overdue, and then money borrowed by the lawyers to the tune of fifty per cent. ["What tune's that?" inquired the widow. "Roguary, I daresay," answered Peggy; "isn't the lawyer in it?" per cent.; and then a flash in the pan that whirls away the cash, and the mistress so *soony* while it lasts; and that's the time to ask a favour from the master, for he never thinks of to-morrow, and the creditors then give a little more credit, and my lady pays half for the opera box, ["What's that, a-lannan?" inquired the widow again. "Oh," said Peggy, who liked to appear wise, "it's a snuff-box, I dare say, though she's rayther young to take to it."] and gets the carriage new painted, and four horses on job. ["Och, my bitter trouble!" exclaimed Mrs Clement, bursting into tears, "to think of the ould ancient family of the Killballys bein' drawn by job horses, and the agent's horses and coult's thrumpling down all the young trees in his lordship's

plantations?"] And we're as gay as sarvants can be that don't get their wages. ["That's mean of Mark," said Peggy; "sure he ought to be proud to sarve the family without wages—that's part of his English breeding."] And all this is talked over in the sarvants' hall, for they've no respect for the family, and no feel at all for the master or mistress, nor even Lady Ellen. ["They are no better than heathens," interrupted the widow; "and if I was Mark, I'd manage to let the master know what vipers he has about him." "Why couldn't he stay in his own country, where he was honoured and respected, and in those times had the ball at his foot?" replied the angry Peggy, and then resumed the perusal of the letter.] The gentleman that'll have the estate, by all accounts wont value it a thraneen, because he doesn't want it, but has full and plenty in the Western Indies, or some other part, I hardly know where, but somewhere it is—lashings of money, and to spare; so, in coarse, he'll not have a heart to the sod no more than others. ["God help us!" exclaimed Peggy, changing colour a little, and letting the open letter rest upon her knees, "this is a poor look-out for here and hereafter!"

"It must only tache us to look up the more," said the widow, raising her eyes. "God help us!—we're a nation of castaways!"

"We are not!" exclaimed Peggy, and her eye kindled. "We are not, mother; and it's our thinking ourselves so, and putting up with the usage we get, that makes us be looked down upon."

"No, Peggy darlint, that's not it," replied her mother. "We've a dale of heart and spirit; but, as I heard a gentleman say once, we want the wisdom; and that's the cruel want at this time o' day, when the world's going mad about it. Poor Paddy's head gets hard enough with blows, but not with wisdom. Go on with the letter, dear."

"There's not much more in it, mother, and what there is, isn't much good." "Indeed, don't be surprised if there's a change for the worse before long. I'm sure the master will be forced to rack-rent every perch that isn't rack-rented already, and then maybe sell the green acres that war so long the pride and glory of the family. I can't think what comes over the gentry; I'm sure, in Ireland, a pound goes as far as three here, and the some body there, is a no body here—so that either in regard of the saving, or the grandeur, 'ould Ireland for ever!"

"The country's warm about his heart still," said the widow, wiping her eyes; "it isn't out of sight out of mind. Is there much more on the letter?"

"Not much," answered Peggy, blushing; "only a few words to Paul Kinsala, which I trust he doesn't need. Mother, did ye ever doubt that Paul had a lanning to any wild ways?"

"Wild ways, a-lannan! Sure I never see even the corner of his eye turned on any girl except yerself."

"It's not in regard of the girls!" exclaimed the rustic beauty, tossing her head with as much pride as if she had been bred at St James's. "It's not that—I don't thank him for constancy—he can't help that, mother, so no thanks to him; but in respect of the doings they say some are at—the swearing-in, and things of the kind. Any wildness that way, mother?"

"No, darlint, not exactly. I can't say I ever did. I hope he has better sense; he has seen enough of examples to keep him from that, I hope. No good ever came yet from such doings. Even suppose one man is got out of the country that has behaved badly to the poor, sure another will be put in worse; and if we drive the gentry away, they take their money with them. The law has a kinder eye on the poor now than it ever had before, and it's by showing obedience to the law, particular when it's in a good humour, that we prove to the world that we deserve the protection we receive, and not the bad name we've got in England; we have enough to bear in the way of poverty still; but, please God, times will mend. What do such disturbances lead to but shame? Wasn't one of those who war forced to fly from the other side the country on account of—you know what—at hide-and-seek through the rocks and bushes of Knockatrim for as good as three months, and his wife forced to beg? and wasn't he at last forced to die without benefit of clergy down in the Black Cave of the fever, and nothing handed him except on the end of a stick? and I remember him once, bright as the sun—But here is Paul Kinsala, Peggy, coming over the hedge. Ah, girl machree! you saw him before I did, and I might as well have talked to Grey-malkin as to you, for you never heeded me. There, your hair's as smooth and shining as satin." And as the old woman advanced to meet her intended son-in-law, she laid her hand on her daughter's head, and signing the sign of the cross on her brow, kissed it affectionately.

When Paul entered, his brow was darkened, and there was an unnatural expression about his face which startled both mother and daughter; he hardly waited to return the warm salutation, met in every peasant's cottage, of "God save ye," with the meet reply of "God save ye kindly," but inquired "if they had had a letter from Mark?" Peggy replied in the affirmative, and placed it in his hands. After he had read it, he folded it up with great deliberation, saying, "There is nothing in this half so bad as what we know already."

"And what is it you know, Paul avic?" said Widow Clement, laying her hand upon his arm, while Peggy, unable to speak, gazed earnestly and tenderly in his face.

"What is it I know?" he repeated; "I know this, that there's to be levying of fines, and every species of wickedness; every lease that can be broke will be broke; and the agent himself this blessed holy Thursday stood before me—me, Paul Kinsala—and told me, there was no good in my promise—that I must quit—the land—quit the house my father and myself war born in—for—that the place was let to a better tenant than I could be, who had money and stock. What do you think of that?" he said, fixing his eyes on the widow, for he could not tell

such tidings, and gaze on the face of her he so dearly loved. "What do you think of that? Now, the truth is, that the farm wants no stocking; the crops are in; he said I should be allowed for them—allowed for the grain my own two hands sowed, with a prayer to the Almighty that we—that Peggy and I—might reap it together. Money! he said I had no money to give for the premises on a new lease, or to carry on the farming. And what did I say?—that I had not, because every penny, every farthing, had been spent on that land. He has the law on his side—and I who never let a gale run on to another, but paid—like an English tenant—I am to starve!"

The young man covered his face with his hands to conceal his emotion; how long he might have endeavoured to do so, it is impossible to say, for his attention was roused by a cry from the widow—the light-hearted, and, generally speaking, strong-headed Peggy, had fainted.

When she recovered, there was a great deal too much feeling excited to admit of many words; the poor girl laid her head on her lover's shoulder, and wept bitterly; the widow stood at the other side, and with more affection than worldly prudence, said, "My dear Paul, never heed it. I'll tell you what: we have a snug house here, and as good as two acres of land, and a bigger penny saved than you might think of, for I had no mind to let my daughter be beholden to you all out, and laid by what I could. So I'll tell you what, Paul: I'll spake myself to the priest, and get the words said* as soon as may be; and then, instead of Peggy's going home to you, avic, why, you'll come home to us. Where's the great differ, Paul? Don't I know the girl's heart is in ye? It's no time to be denying it now, when ye're in trouble; and sure ye're the same as my own son this many a day. Maybe it's a showing of God's mercy after all. I'm not as light either on the foot or in the heart as I used to be, and would be lonely many a time if she was away; but now I'll have a son, instead of loosing a daughter; and Mark has my lord's ear; and if that wouldn't do, I'm not too ould to go to London myself, and get spaking to him; and, sure, with my two birds in my cage, though it is but a dawshy one," sobbed the kind woman, looking round cheerfully through her tears, "I'll be a proud and a happy woman, and no need to hire a labourer now, or be beholden to the neighbours, who never let a lone woman hire, if they can help her. Sure you'll do a hand's turn for Peggy's mother for sake's sake. Or," she continued, after a pause, with a generosity that would have done honour to a heroine, "or, if it would be more agreeable to you, Paul, I'd settle the bit of land and the place on the both of you, for it was given me by the lord for myself, to do what I pleased with, at a pepper-corn rent. And that would ease the proud spirit that you ever had, Paul darlint; and small blame to you, for your people war far above us, and yet you never looked down on us, nor on her."

"Look down on you—on her!" he exclaimed, pressing his betrothed to his bosom; "who ever looked down on Peggy Clement? But no, mother, no; by all that's holy, I'll be revenged—I'll be revenged—justice I'll have. If I can't have it by law, I'll have it—see that, now!" he continued; and for a moment forgetting the presence of the two women he loved best on earth, he stamped his foot violently on the ground, and suddenly dropping on his knees, threw his arms upwards, and clenching his hands, swore a deep and bitter oath, that unless his farm was given back, he would "water the earth with the blood of agent or landlord." This was very frightful; and while the widow and her daughter looked on him, they clung together, unable to restrain his words, yet trembling at their import.

"I didn't deserve this from you," said the gentle old woman, weeping; "I thought to turn the throuble from you, and you have turned black bitterness on me."

"No, mother—no, Peggy!" he exclaimed, the warm and affectionate current of Irish feeling rushing back to his heart, now that he had given words to his fury; "no, no, you'll be proud of me yet; I'll do no meanness, nothing to call a colour to your cheek; nothing—though I'm not to be trod like a worm in the dust.—No money to pay for a new lease! I might have had full and plenty to spend for a new lease, if it had not been that I spent it on the land—and now for it to be taken from me! I'm not the only one in the place that cries shame; not the only one that will have revenge. Go through the town land, into the villages, along the high roads, and ye'll hear the same thing from every lip; ye'll see the same purpose in every eye. Didn't Macmurray himself say—"

"Don't name Macmurray," interrupted Peggy, speaking for the first time; "he's bad, egg and bird, and no fit companion for you at all at all, Paul; his character's blasted this many a day, and he always had a spite to the family: have nothing to do with him; for God-sake have nothing to do with him. Keep yerself to yerself, Paul; no harm can ever come of that."

"She speaks the truth, avic," added the old woman; "take patience, and it will come round, it will all come round; ye're of a good stock, Paul, with fine health, praise be to God, and a good character; and with that, no need of fear for any boy of five-and-twenty; think of what I said, Paul."

"God bless you, dear mother; it is not because I'm not down on my knees to thank you, and bless you, that I don't feel your goodness. And come bad or good, in the presence of the Almighty I swear there's no girl on the face of the green earth will ever have my heart but Peggy Clement; though, as things are—I mean from what I know, I—I—can have no claim on yer promise, Peggy—I—"

He could not finish his sentence, and Peggy looked upon her lover in stupified astonishment. It never occurred to her, indeed it very seldom occurs to Irish women of her class, that poverty should offer any barrier to an union. And the poor girl's feelings were torn by the love-beatings of her own heart, and the dread that Paul's "heart" was changed towards her. What was the cause of this sudden declaration, neither mother nor daughter

* Get married.

had time to inquire; for suddenly he invoked a blessing on the widow, and, kissing the maiden's lips, burst from the cottage. When he was gone, strange as his conduct appeared, no word of reproach escaped his friends. Peggy, after a genuine flood of tears, communed with her mother for a long time.

Nothing could exceed the agitation of the neighbourhood. Wild rumours were afloat; positive injustice had been already done to more than to Paul Kinsala; and the fine old trees, trees that had been the pride and glory of the neighbourhood for years, were doomed to the woodman's axe; in truth, the beautiful valley of Killbally, that during the landlord's residence had been gemmed with cottages and adorned by happy smiling faces, might now be called a valley of tears. Great as the change had been, it needed this to complete it; and the sighs and moans of, in this instance, a decidedly ill-used peasantry, mingled with the free air and bright sunshine that poured upon the landscape! The bitterest curses were heaped upon the agent's head, who, notwithstanding his desperate injustice to Paul, had not exceeded the instructions he received from the landlord abroad, whose difficulties had dictated the heartless order—that he was to rack and drive, and get money by humane means if he could, but get it by any means sooner than not get it. His very nature seemed changed by his necessities; there was an evident movement in the country to resist this oppression, and plenty of persons (who, having forfeited their own claim on society, and become lawless) were sufficiently anxious to induce others to follow their example, and spread the spirit of discontent far and wide. Peggy Clement, with the assistance of the village schoolmaster, indited a letter not only to her brother, but to Lady Ellen, stating the rights of the case, and pleading, if not elegantly, eloquently, for her lover, and indeed for all those who had been honest, faithful, and true in their callings. These letters were, to the schoolmaster's astonishment and her own, not only written but dispatched that very day; while the widow was "questing" through the neighbourhood picking up every bit of news, not from a love of idle gossip, but from the deepest anxiety to discover if the machinations of others, or his own impetuosity, were likely to lead Paul into serious mischief. The Widow Clement, though not young, was both clear and quick-sighted. She knew that if Paul was led to do any thing rash, his life would pay the forfeit, for he was too fearless and too frank to have a villain's caution; and, moreover, she knew that the happiness, the existence of her child, hung upon him. These were strong incentives to the curiosity and the caution of a woman and a mother, and a strong feeling of respect for the family mingled with her sympathy for the distressed and ruined tenants, who were breathing vengeance at every whisky-house in the neighbourhood; for mischief is never undertaken in Ireland without its having been first planned over the burning fluid, which stimulates them to the destruction of themselves and others.

"There's enough work now for day labourers, any way," said Larry Toole to Andy Smith.

"And what will they get for it? Eightpence a-day, and the negar that offers it saying, 'that if the neighbours don't take it, he'll get plenty of the mountaineers that will.' Think of that!—bringing starving strangers down upon us, whose boast it used to be, to keep our own poor from begging! Let them come and take what they get—that's all! I'll never work in it for eightpence a-day! We never were offered less than tinnence before! However, let 'em go on their own way; there's one comfort, it won't last for ever."

"Sure, the agent says the common's my lord's, and that no cattle, not even a pig, is to go on it now without payment, and the marsh beyond it too—think o' that! And the turf we had for cutting off the bog is to be paid for! I wonder does the lord know that?"

"There is a Lord knows it!" answered Andy again, who had always been discontented; "but, never heed; it won't be always so, I'll go bail."

Many such hints did the widow hear, but she and her daughter had been unable that evening to determine what course to pursue as regarded Paul Kinsala. That night passed, the next day, and the next. The spirit of discontent increased more and more. Some said Paul had refused to yield possession; others, that he had gone to London to appeal against the agent's decision. The first, nay even the second day, Peggy had borne herself bravely. She had re-strung her nerves, and waited the result with many and many an earnest and deeply breathed prayer to those in whom she trusted, that she might be spared more suffering, or taught to bear it. Her wheel, or knitting needles, pursued their wonted motions, and she moved about the house as usual, save that a restless gaze was ever directed to the door or window.

The agent had been pelted and hooted through the village, and had thought it wise to station a police force in the castle that had once been guarded by the hearts of an affectionate people. There were other disturbances; more than one act of wild excess committed, at once absurd and unjustifiable; and Peggy's cheek grew pale, and her step feeble, in the course of one little week.

"I shall die, mother, and soon," said the poor girl; "there's a wakeness about my heart, and a mist, like the film of a winding-sheet, over my eyes, that means no good. If Paul wasn't after something bad, he'd have been here before this, and after all you said to him. But may be so best. I had two hopes in the world, mother—you—my hope for you was, that I might be a blessing and a comfort to you hereafter; and when the Lord thought fit that I might close yer eyes—my hope in him!—But it's all gone, it's all gone, like the bloom of that thorn-tree which the last wind shook to the earth." The widow did not overwhelm her beloved child with consolation. She said few words, but she said them wisely, and endeavoured, by every simple means in her power, to vary her employments. She knew that though she might suffer greatly, she had really a strong and active mind, and that those who have such seldom die, as it is called, for love.

The Widow Clement felt all this; yet, while her trust

in the Almighty schooled her to patience and obedience, it did not cramp her exertions; and, with a firm resolve to find out if things were as bad as she suspected, and how Paul was engaged, she contrived some new occupation for her daughter, and set off, determined to fathom the troubled waters; and be it remembered, it was the troubled waters of a disturbed Irish district this solitary unprotected woman resolved to fathom. She left the cottage soon after daybreak, and about one o'clock, Peggy, whose eyes, despite her employment, were seldom off the undulating line that showed how the road wound round the mountain, perceived the approach of the letter-carrier. She flew to meet him.

"It's bad for the town land," he said, "when even you, Miss Peggy, have a serious face. There's nothing else going now; the boys at the castle have turned out for higher wages in regard of the trees they're felling, and the place is so shut up, that they won't let me pass the lodge, though I have English letters. They say there's a dispatch gone off for more police. God help us if that's true, for they're ripe for a ruction through the whole town land. Some say the agent's not in the house, some say he is, some say the property's sold; but, God be with ye, Peggeen gra, ye're not minding a word I'm saying," and the old man retraced his path.

No painting could convey an idea of the rapid changes of colour and expression that passed over the cheeks and brow of Peggy Clement as she stood at her cottage door, the sunlight resting on her hair, which fell in heavy masses on her neck and bosom. She held the letter before her with both hands; her bosom heaved convulsively; and though her very arms trembled, still she grasped the paper so tightly that there was no danger of its falling. Her very soul seemed drinking in the contents; but whether the draught was of joy or sorrow, it would have been impossible to tell. She gasped for breath, pressed her hands upon her bosom, turned to the cottage, and twice ejaculated "mother!" Then, remembering that her mother was not there, that she had no one near to whom she could disclose her emotions, she dropped upon her knees, and, throwing her head back, as if she wished her grateful thoughts and feelings to wing their way to heaven, she uttered a few broken exclamations of joy and gratitude; then, hastily throwing on her cloak, and drawing the hood forward so as to conceal her agitation, she followed in the path pursued by the old postman. At first my heroine walked with great rapidity, but then she suddenly paused, and said within herself, "But I'm not to tell it, except to my mother and Paul. Mother will be part sorry—and Paul!—where shall I find Paul?—but, any way, I'll find her." She had not proceeded very far, when she saw her mother coming towards her, and before she could communicate her news, the old woman burst into tears. A few words can express their cause: she had received information—how, it does not matter—that the agent had left the castle; that, finding the country so outrageously disturbed, he had taken refuge, as secretly as he could, at the house of a neighbouring gentleman, resolving to proceed to Dublin that night; that he believed his intention was unknown, perfectly unknown, but that it had transpired; and that several persons had determined he should never reach his destination. The widow had every reason to believe that Paul Kinsala was of the number. To give the doomed man information of what was intended, would have been to draw down the vengeance of the party upon their own heads. Much as Peggy had suffered, she saw not only the wickedness but the impolicy of the fearful crime they meditated. The best and bravest sink beneath small trials, and many great minds are incapable of small sacrifices; but present an object of sufficient magnitude before them, and their courage and fidelity stand forth boldly and at once to encounter and overcome. So it was with this simple peasant girl. She told her mother what she intended. The old woman would have accompanied her, but time pressed. She was already worn out with walking and anxiety, and no third person could share their confidence. But she looked on her daughter; and the bright flashing of her eye, the proud and determined carriage, that, as it were, bespoke, while it enshrined, her purpose, assured the mother that her daughter was determined. As long as she was by her, she felt assured of her success; when, however, she was out of sight, her spirits sank, and she could only weep and pray, sitting on the hill-side, from whence she still saw Peggy's receding figure. The day was on the wane, and yet she felt as if the sun would never set. Then again she fancied he set too quickly. The crescent moon hung its silver bow in the clouds before the fading away of daylight. The widow could not return to her cottage; she fancied she should see her child sooner where she was; she would not, could not stir. At last she took out her beads; one by one the silent tellers of her devotion dropped from her fingers, while her lips mechanically repeated her prayers. Still Peggy came not. The firmament was glittering with those jewels of immortality—types, beautiful and mysterious, of him who is the same "to-day, yesterday, and for ever." Still her daughter came not; there was no bell to tell the passing world of passing hours, but hill and valley, mountain and river, were dark beneath the sky; the grasshopper had folded his wings under the shamrock, and heaven's own minstrel nestled with her young in the deep corn furrow; the van-guard of the rooks had swept towards the woods of Killbally, where they were soon to be despoiled of their homes—their last caw! caw! had sounded in the widow's ear. She was sorry they were all past—crows are good company on a mountain's brow. The shrill whistle of the curlew suddenly darted like an arrow through the air. She started to her feet, as if it had been the warning whistle of a Whiteboy, and the humming beetle, who had rested on her cloak, whizzed away, wondering why the mountain moved. Presently, as she looked around (for still her daughter came not), she saw a large bird flying heavily, heavily, between her and the now risen moon, upon which she had unconsciously fixed her eyes. It came nearer—then turned and hooted—again and again. Widow Clement was a strong-nerved woman,

yet the hoot of that wild owl sent the blood curdling to her heart. She could support the silence no longer; the solitude became frightful to her. But it was no longer solitude; it was peopled by her fancies. She walked with rapid strides, not towards her own home, but along the path her daughter had pursued.

The destination of Peggy Clement was a hut about three miles from where she had met her mother. It was ruined and desolate, save when peopled by those who wished concealment. It could not be distinguished from the high road along which Mr Crumbie was to pass, and still it was close to it. My tale is already too long; I must hasten its conclusion. Her hand, girl though she was, did not tremble when she knocked at the door, that was fastened on the inside; nor, when she had done so, was there the least noise or reply. The inmates were evidently on their guard against intrusion. Again she knocked. No answer. At last she knelt down by the door, and, placing her mouth to the latch-hole, she said, "Paul Kinsala, Peggy Clement is here, and will stay here until the time comes when, for a reason you have, you will all have it." There was a murmur within—a whispering; the door was silently unfastened; a hand, whose touch sent the blood thrilling from her arm through her whole frame, led her in, where all, except the light of her own brave virtuous spirit, was dark; and a voice she would have given worlds to hear any where but there, whispered, "You are mad!"

"You are all mad!" she said aloud, and the tones of her clear fearless voice made music in the darkness. "Strike a light, see me, and hear what I have to tell you! Strike a light—a gun-flint will do it, and ye're not wanting that." She was obeyed, but the light emitted from the small candle was hardly enough to render visible the countenances of five men, who peered at her where she stood, close to Paul Kinsala, who trembled by her side as if he were the aspen, she the oak. "I don't ask ye why ye are here—I know why; but I will tell ye why I came. Ye want vengeance on the agent! Boys, boys, it's a poor vengeance that returns evil, as it would here, five-fold on yourselves; for, sooner or later, such is found out. I thought to have been here before, though there's plenty of time; and, boys, what d'ye think, I've brought ye—VENGEANCE!" There was a movement in the hovel; and Paul, who had shrunk from her side, from that feeling which prevents a high mind from coming in contact with a high mind, when it knows it has been guilty of an unworthy action, advanced again.

"Indeed it's thruth I'm telling; and I hope ye'll remember me in yer prayers, for, by God's mercy, I'll keep the stain of blood from yer souls this night. Listen to me, thin, and here's my credentials." She took from her bosom the letter she had received from the postman.

"Here's news—the old lord's dead!"

Various ejaculations followed this announcement. "The letter is from my brother Mark. The old lord is dead of a sudden; and when he was still in it, before the breath was out of his body, he gave his consent to the heir's marriage with Lady Ellen. Ye all know how rich the heir was, and how my lord couldn't abide the name of him in the house. But, somehow, under some false name, he knew Lady Ellen, and won her heart; and the last thing my lord did was to give them his blessing. And Lady Ellen wouldn't hear to the love, Mark says, until the heir promised to redeem Killbally from debt and agents, and reside six months of the year at the old castle!"

When Peggy entered, not one of the party could have been called sober; all were more or less intoxicated, and all were labouring under unnatural excitement. This unexpected announcement sobered them, and a shout of triumph burst from four of the number. The fifth would have preferred murder to gold or prosperity; so he waited with the cold-blooded determination of a villain to hear what would follow.

"Where's the proof of this?" he inquired.

"Here," said Peggy, triumphantly showing the letter. "And more—my lord acknowledged the promise of a new lease to you, Paul, and the heir promised it—promised it before Mark." It was only in saying this that her voice faltered.

"And because you get a new lease, I suppose we all may go to the devil," retorted Shawn Glyne; "but if ye forget yer oaths, boys, I don't forget mine. I swore I'd have the heart's blood of Crumbie, and I will; before all the holy saints of heaven, and by this blessed cock, I will!" He sank on his knees, and kissed a small prayer-book which he drew from his vest. Nothing could be more picturesque than the appearance of the interior of the hut at that moment; the light of the candle fell full upon Shawn's face, darkened and distorted by every bad and violent passion, and the erect form and bright animated countenance of Peggy Clement was also distinctly visible. As she stood a little in advance of her lover, every other object seemed clouded and misty; but these two, so different, yet so expressive of their several characters, were finely contrasted; the one so like an angel, in all the pure and holy semblance of good and firm intent, the other composed of great and powerful elements, yet blighted by sin—converted from a man into a demon.

The party were perplexed by the determination of their comrade; they hated the agent with a bitter hatred; but Peggy's clear statement of what had occurred, convinced them at once that they would have justice, without taking the law into their own hands; thus their personal safety was secured, and their purpose effected. But Shawn had already passed the pale, and his hatred to the agent was mingled with a fiendish desire to see others steeped in crime as deeply as himself.

"You hear him, Paul," said Peggy, and her voice sounded sweetly, as a voice from heaven. "You hear him—what do you say?"

"I swore I'd have justice," replied the young man, "and I saw but one way. The Lord, in his mercy, has seen another, and it won't be the first time I've had reason to bless your step and your voice. You have saved me from destruction."

Shawn advanced towards him while he spoke, but

Peggy stood between them. "Thank God!" she exclaimed, "thank God, Paul, I've heard yer words; I've blest ye for them. My heart's lighter, for I knew *yours* could never be rightly in it. I'm satisfied of that. I see, Shawn—I see that ye're determined to have the agent's life; and there are others whose minds are not made up. But your opportunity is past." Again there was a movement amongst the men, more decided than before. They pressed towards the girl, as if uncertain what she had done, or what they must do; her lover would have drawn her towards him, but she stood firm.

"Your opportunity is past, I say. I tould the agent he would be murdered if he quitted where he is. I sent to hasten the soldiers that now, ay, at this minute, protect the house. No one suspects ye—that will tell. And, bless God, every one of ye—if ye don't now, ye will, and on yer bended knees—that little wisdom of a simple girl saved ye from a crime that would have brought disgrace on yer country, and sin to yer souls for ever!"

POPULAR INFORMATION ON SCIENCE.

ON THE ELECTRICITY OF ANIMALS; ESPECIALLY THAT CALLED ANIMAL ELECTRICITY.

SECOND ARTICLE.

WE now proceed to the *gymnotus*, which, different from the torpedo, was not known till modern times. It is often described as a disagreeable-looking animal, resembling a bulky eel; but Humboldt's plate represents it as a beautiful-looking fish, of a fine olive-green colour above, paler beneath, and spotted with numerous red and yellow markings along the back. We suspect there are different species, though this has not been established. Humboldt was informed that a black variety, which he did not see, gives the strongest shocks, whilst Block says this peculiarity belongs to those of a reddish hue. Bajan states the colour to be slatey black. Its average size is from three to four feet; frequently it extends to six and seven; and it is often stated, on respectable authority, such as that of Bancroft, Garden, and Pennant, that it attains the length of from ten to twenty feet, which Humboldt, however, says is going too far. The *gymnote* was first made known to philosophers about the year 1671, when its wonderful powers were announced to the French Academy by M. Richer. His statements, however, were received with much scepticism; and it was not till towards the middle of the last century that a general belief in its existence was entertained. At that time, the observations of Condamine and others became known, to which those of Fermin and Bancroft succeeded, and speedily it was more particularly described by Drs Williamson and Garden. According to this latter gentleman, the animal has the power of lengthening and shortening its body, somewhat like a worm, and is also capable of swimming backwards and forwards with equal ease, when the undulations of the body begin respectively at the tail or head.* It would appear that this eel is an inhabitant exclusively of South America. Humboldt found it in the Calvado "in innumerable quantities."

Mr Hunter was the first individual who gave a detailed description of the electric apparatus of this fish, as of the torpedo; and the difference between them is great. These organs in the *gymnote* occupy nearly one-third (Humboldt says, four-fifths) of the animal's entire bulk, being the posterior part. They are formed of two series of tendinous membranes, running from the posterior part of the cavity of the belly to the tail, one part of which consists of horizontal plates placed very near each other, and the other of perpendicular plates, near the lower part of the animal. The whole of this structure is divided into two pairs of distinct organs, of very different sizes, the largest being uppermost. They are covered only by the common integuments. In the *gymnote* dissected by Mr Hunter, which was 2 feet 4 inches long, the large organ of one side was about 1½ inch in breadth at its thickest part, and in this space there were 34 longitudinal divisions. The smaller organ was about half an inch in breadth, and contained 14 septa or partitions. The perpendicular membranes are placed much more closely together than those of the upper series, Mr Hunter counting 240 in an inch, filled with a glary transparent substance. Lacépède calculated that the discharging surface of these organs in a fish four feet long, is at least 123 square feet in extent; while in the torpedo, the ordinary size is only about 58 feet square. The nerves in the electric organs of the *gymnotus* are very large and numerous, and are spread in very fine twigs over the cells of the organs. Dr Knox counted 15 nervous branches distributed on each inch of the structure, each nerve being for the most part subdivided into as many branches as there are longitudinal septa.†

The *gymnotus* inflicts far more astounding shocks than the torpedo. According to Bancroft, the strokes of the large ones are instantly fatal. When one of average dimensions is touched with one hand, a smart shock is generally felt in the hand and fore-arm; and when both are applied, it affects the whole frame, striking to the very heart. The discharges of the larger fish are sometimes sufficient to deprive men, while bathing, of sense and motion, and mules are often destroyed in attempting to ford those rivers where the *gymnote* abounds. This so frequently happens in some districts of South America, that in the neighbourhood of Urituca, a route at one time much frequented was entirely abandoned in consequence of the great loss of mules. Humboldt mentions, that having placed his feet upon a *gymnotus*, he experienced a more dreadful shock than

he ever received from a Leyden jar, and that he felt severe pain in his knees and in other parts of his body, which continued for several hours. According to Bryant, a discharge sometimes occasions such strong cramps of the muscles which grasp the fish, that they cannot let it go; and the shock being repeated, painful sensations are experienced throughout the body, and headache, with pain in the limbs, remain for some time; and Dr Flagg states, that paralytic affections, as well as giddiness, are said occasionally to follow the reception of strong shocks.*

The effects of the discharge of the *gymnote* cannot be better illustrated than by referring to the masterly description which Humboldt has given of the capture of the animal, as practised near the town of Calabozo. The Indians are well aware of the danger of encountering them while their powers are unexhausted. They therefore collect twenty or thirty wild horses, force them into the pools, and when the fish have exhausted their batteries, lay hold of them without difficulty. The horses at first exhibit much agitation and terror, but they are prevented from leaving the water by an enclosed band of Indians, who goad them with bamboos when they attempt to escape. "The eels," says Humboldt, "stunned and confused by the noise of the horses, defended themselves by reiterated discharges of their electric batteries. For some time they seemed likely to gain the victory over the horses and mules: these in every direction, stunned by the frequency and force of the shocks, disappeared under water. Some horses, however, rose again, and, in spite of the active vigilance of the Indians, gained the shore, overcome with fatigue; and their limbs being exhausted with the explosions, they stretched themselves upon the ground. I remember," says he, "a superb picture of a horse entering a cavern, and terrified at the sight of a lion. The expression is not there stronger than what we witnessed in this unequal conflict. In less than five minutes two horses were drowned. The eel, more than five feet long, glides under the belly of the horse or mule; it then gives a discharge from the whole extent of its electric organs, which directly affects the heart and other vital parts. After this commencement, I was afraid that the sport might end tragically, but the Indians assured us that the fishing would soon be finished, and that nothing is to be dreaded but the first assault of the *gymnotus*. In fact, whether the galvanic electricity is accumulated in repose, or the organ ceases to perform its function when fatigued by too long-continued use, the eels, after a time, resemble discharged batteries. Their muscular movements are still equally active, but they no longer have the power of giving energetic shocks. When the combat had lasted a quarter of an hour, the mules and horses appeared less affrighted; they no longer bristled up the mane, and the eye was less expressive of suffering and terror. They no longer were seen to fall backwards; and the *gymnoti*, swimming with the body half out of the water, and now flying from the horses instead of pursuing, began themselves, in their turn, to approach to the shore almost lifeless; and they were then easily captured by means of small harpoons attached to long cords." The fishes left in the pool thus disturbed were found scarcely able to give even weak shocks at the end of two days. Humboldt concluded from what he saw and heard, that the horses which are lost in the course of this singular fishery are not directly killed, but merely stunned by the power of the shock; their death being occasioned by the subsequent submersion.

The remaining electrical fishes, not having been examined with the same care as the preceding, will not occupy us long. The first we name is the *Silurus* of the Nile and Senegal, the Roach or lightning of the Arabs (*Silurus electricus*, Linn.; the *Malapterurus* of Lacépède), which has been partially known for many years. It is associated with a group, some of which are considered as the largest and most sluggish of river fish. The usual length of the electric species is scarcely two feet. Its head and fore parts are very broad and depressed. Its electric organs present us with an entirely new arrangement of parts. The apparatus consists of a thick layer of dense cellular membrane, which completely surrounds the body, immediately under the integuments. So compact is this tissue, that at first sight it might be mistaken for a deposit of fatty matter; but under the microscope, it is found to be composed of tendinous fibres, closely interwoven, the meshes of which are filled with jelly-like matter. This apparatus is divided into two circular layers by a strong membrane, the outer lying immediately under the true skin, the inner being placed upon the flesh itself. Both of these parts are isolated from the surrounding tissues by a dense membrane, except where the nerves and blood-vessels enter. The cells of the outer organ are so minute that they require a lens in order to be distinctly perceived: the inner organ is also cellular, and appears somewhat flaky: both are most abundantly supplied with nerves. The *Trichinure*, the fourth kind of fish we have named, is an inhabitant of the Indian seas: its colour is a pale brown, variegated with spots of a deeper hue. And, finally, we close this enumeration by alluding to the *Tetraodon*, a member of the extraordinary *Short-Sun-fish* group of British authors. It was among the coral rocks of Johanna, one of the Comoros, in the Indian Sea, that Lieutenant Paterson discovered this fish. His specimen was seven inches long, and two and a half broad. The colour of its back was brown, of its belly sea-green,

of its sides yellow; its body was covered with red, green, and white spots; the eyes were large. Lieutenant Paterson caught two of them in a linen bag, the water being about 60 degrees Fahrenheit, and he had no sooner taken one of them in his hand, than he received so severe a shock that he was obliged to let it go. He carried the two fishes to the camp, and obtained the evidence of the surgeon and adjutant in favour of his discovery: the former, having held it between his hands, received a distinct shock, and the latter received a shock by merely touching the fish on its back with his finger.

In taking a general review of these interesting organs, we are struck with the existence of a certain degree of analogy amongst them, and yet we fail to discover such resemblances as might be expected, and such as exist between the structure of other organs performing the same functions in different animals. Here we have tendinous membranes variously arranged, and all so as to form a series of separate cells filled with a jelly-like matter. Yet how great is the difference between the great columnar cells of the Torpedo, and the minute cells of the Silure! All, however, are equally supplied with nerves of very great size, larger than any others of the same animals, and larger, indeed, than any nerve in any other animal of like bulk.
